#NAME? of solution----------

pH = 8.46
pe = 4
Specific Conductan (µS/cm, 25°C) = 3214
Density (g/cm³) = 0.99848
Volume (L) = 1.00332
Activity of water = 0.999
Ionic strength (mol/kgw) = 3.66E-02
Mass of water (kg) = 1.00E+00
Total carbon (mol/kg) = 1.59E-03
Total CO2 (mol/kg) = 1.59E-03
Temperatu (°C) = 25
Electrical balance (eq) = 3.73E-03
Percent error, 100*(Cat-| = 6.26
Iterations = 7 (14 overall)
Total H = 1.11E+02
Total O = 5.55E+01

#NAME? couples----------

Redox	couple	pe	Eh	(volts)
N(-3)/N(5)	4.4425	0.2628

**For a gas, SI = log10(fuga Fugacity = pressure *
For ideal gases, phi = 1

Initial solution 23

#NAME? composition----------

Elements	Molality	Moles
Alkalinity	1.92E-02	1.92E-02
Ba	3.48E-06	3.48E-06
Ca	7.03E-03	7.03E-03
Cl	2.58E-01	2.58E-01
Cu	2.40E-07	2.40E-07
F	7.30E-04	7.30E-04
Fe	1.85E-06	1.85E-06
K	3.53E-03	3.53E-03
Mg	5.68E-02	5.68E-02
Mn	3.10E-07	3.10E-07
N(-3)	3.80E-05	3.80E-05
N(5)	3.20E-04	3.20E-04
Na	2.48E-01	2.48E-01
S(6)	2.92E-02	2.92E-02
Zn	2.02E-06	2.02E-06

#NAME? of solution----------

pH = 8.46
pe = 4
Specific Conductan (µS/cm, 25°C) = 29379
Density (g/cm³) = 1.01311
Volume (L) = 1.00731
Activity of water = 0.99
Ionic strength (mol/kgw) = 3.91E-01
Mass of water (kg) = 1.00E+00

```
Total carbon (mol/kg) = 1.68E-02
Total CO2 (mol/kg) = 1.68E-02
Temperatu (°C) = 25
Electrical balance (eq) = 4.28E-02
Percent error, 100*(Cat-| = 6.55
Iterations = 10 (223 overall)
Total H = 1.11E+02
Total O = 5.57E+01

#NAME? couples----------

Redox couple pe Eh (volts)

N(-3)/N(5) 4.4352 0.2624

#NAME? of species----------
```

#NAME? of solution---------------------------

pH = 8.46
pe = 4
Specific Conductan (µS/cm, 25°C) = 34774
Density (g/cm³) = 1.01652
Volume (L) = 1.0083
Activity of water = 0.988
Ionic strength (mol/kgw) = 4.73E-01
Mass of water (kg) = 1.00E+00
Total carbon (mol/kg) = 2.02E-02
Total CO2 (mol/kg) = 2.02E-02
Temperatu (°C) = 25
Electrical balance (eq) = 5.21E-02
Percent error, 100*(Cat-| = 6.58
Iterations = 13 (280 overall)
Total H = 1.11E+02
Total O = 5.57E+01

#NAME? couples--------------------------------

Redox couple pe Eh (volts)

S(6)	3.94E-02	3.94E-02
Zn	2.73E-06	2.73E-06

#NAME? of solution----------

pH	=	8.46		
pe	=	4		
Specific	Conductan	(µS/cm,	25°C)	= 37906
Density	(g/cm³)	=	1.01856	
Volume	(L)	=	1.0089	
Activity	of	water	=	0.986
Ionic	strength	(mol/kgw)	=	5.22E-01
Mass	of	water	(kg)	= 1.00E+00
Total	carbon	(mol/kg)	=	2.23E-02
Total	CO2	(mol/kg)	=	2.23E-02
Temperatu	(°C)	=	25	
Electrical	balance	(eq)	=	5.77E-02

Percent error, 100*(Cat-|= 6.6
Iterations = 14 (321 overall)
Total H = 1.11E+02
Total O = 5.57E+01

#NAME? couples----------

Redox couple pe Eh (volts)

N(-3)/N(5) 4.4362 0.2624

#NAME? of species----------

 #NAME? of solution---------------------------

        pH = 8.46
        pe = 4
        Specific Conductan (µS/cm, 25°C) = 1678
        Density (g/cm³) = 0.99776
        Volume (L) = 1.00314
        Activity of water = 1
        Ionic strength (mol/kgw) = 1.86E-02
        Mass of water (kg) = 1.00E+00
        Total carbon (mol/kg) = 8.03E-04
        Total CO2 (mol/kg) = 8.03E-04
        Temperatu (°C) = 25
        Electrical balance (eq) = 1.88E-03
        Percent error, 100*(Cat-|= 6.24
        Iterations = 7
        Total H = 1.11E+02
        Total O = 5.55E+01

 #NAME? couples--------------------------------

        Redox couple pe Eh (volts)

        N(-3)/N(5) 4.4048 0.2606
```

#NAME? of solution----------

pH = 8.46
pe = 4
Specific Conductan (µS/cm, 25°C) = 12689
Density (g/cm³) = 1.00335
Volume (L) = 1.00459
Activity of water = 0.996
Ionic strength (mol/kgw) = 1.56E-01
Mass of water (kg) = 1.00E+00
Total carbon (mol/kg) = 6.77E-03
Total CO2 (mol/kg) = 6.77E-03
Temperatu (°C) = 25
Electrical balance (eq) = 1.66E-02
Percent error, 100*(Cat-|= 6.43
Iterations = 10 (140 overall)
Total H = 1.11E+02
Total O = 5.56E+01

#NAME? of solution---------------------------

pH = 8.46
pe = 4
Specific Conductan (µS/cm, 25°C) = 20519
Density (g/cm³) = 1.00777
Volume (L) = 1.0058
Activity of water = 0.993
Ionic strength (mol/kgw) = 2.63E-01
Mass of water (kg) = 1.00E+00
Total carbon (mol/kg) = 1.13E-02
Total CO2 (mol/kg) = 1.13E-02
Temperatu (°C) = 25
Electrical balance (eq) = 2.84E-02
Percent error, 100*(Cat-| = 6.5
Iterations = 10 (268 overall)
Total H = 1.11E+02
Total O = 5.56E+01

#NAME? couples--------------------------------

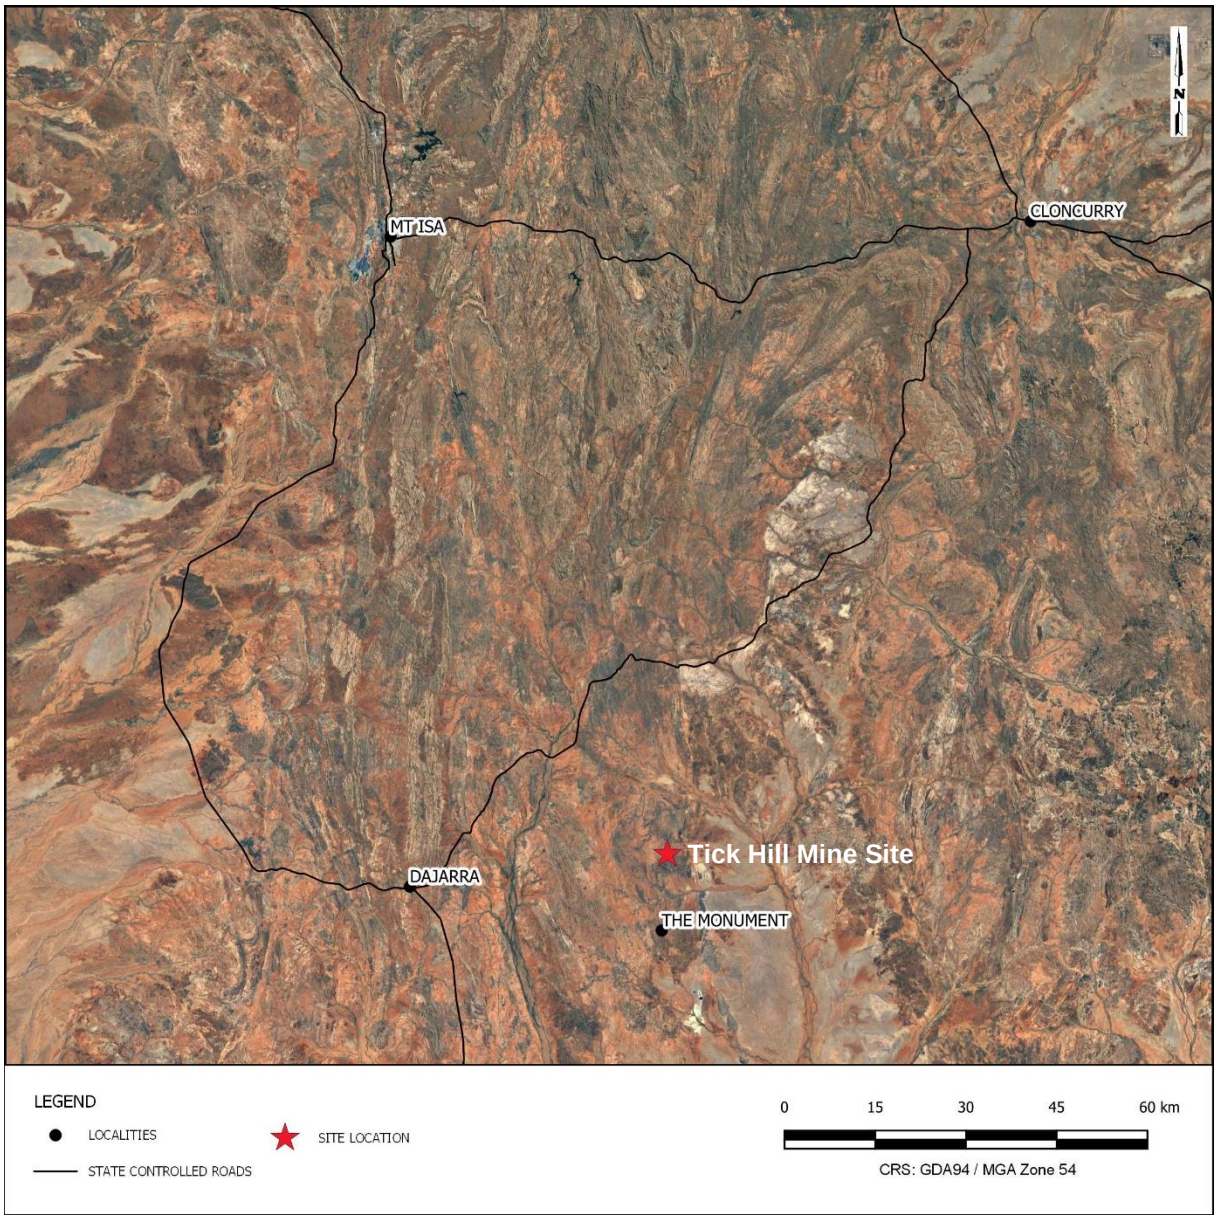
1 INTRODUCTION

1.1 Background and Scope

The Tick Hill Mine is owned by Carnaby Resources and operated by Blue Cap Mining Pty Ltd (Blue Cap). The site is located on mining leases (ML) ML 7094, ML 7096 and ML 7097, and is regulated under Environmental Authority (EA) EPML00820613, dated 1 April 2022 **[1]**.

The Tick Hill mine is in north-western Queensland, approximately 112 km southeast of Mt Isa and 43 km east of Dajarra. The location of the site is shown on **Map 1**.

MAP 1: TICK HILL MINE SITE LOCATION



TAILINGS.WATER.WASTE.

ATC Williams Pty Ltd (ATCW) has been commissioned by Blue Cap to undertake a consequence category assessment (CCA) for the existing tailings storage facility (TSF) forming part of the proposed tailings reclamation project (TRP). The CCA has been undertaken in accordance with the 'Manual for Assessing Consequence Categories and Hydraulic Performance of Structures' **[2]** (the Manual).

The purpose of the CCA is to characterise potential impacts on downstream receiving environments in the event of a failure for the TSF, and based on the assigned consequence category, to identify hydraulic design criteria from the Manual **[2]** relevant to TSF design and operational constraints.

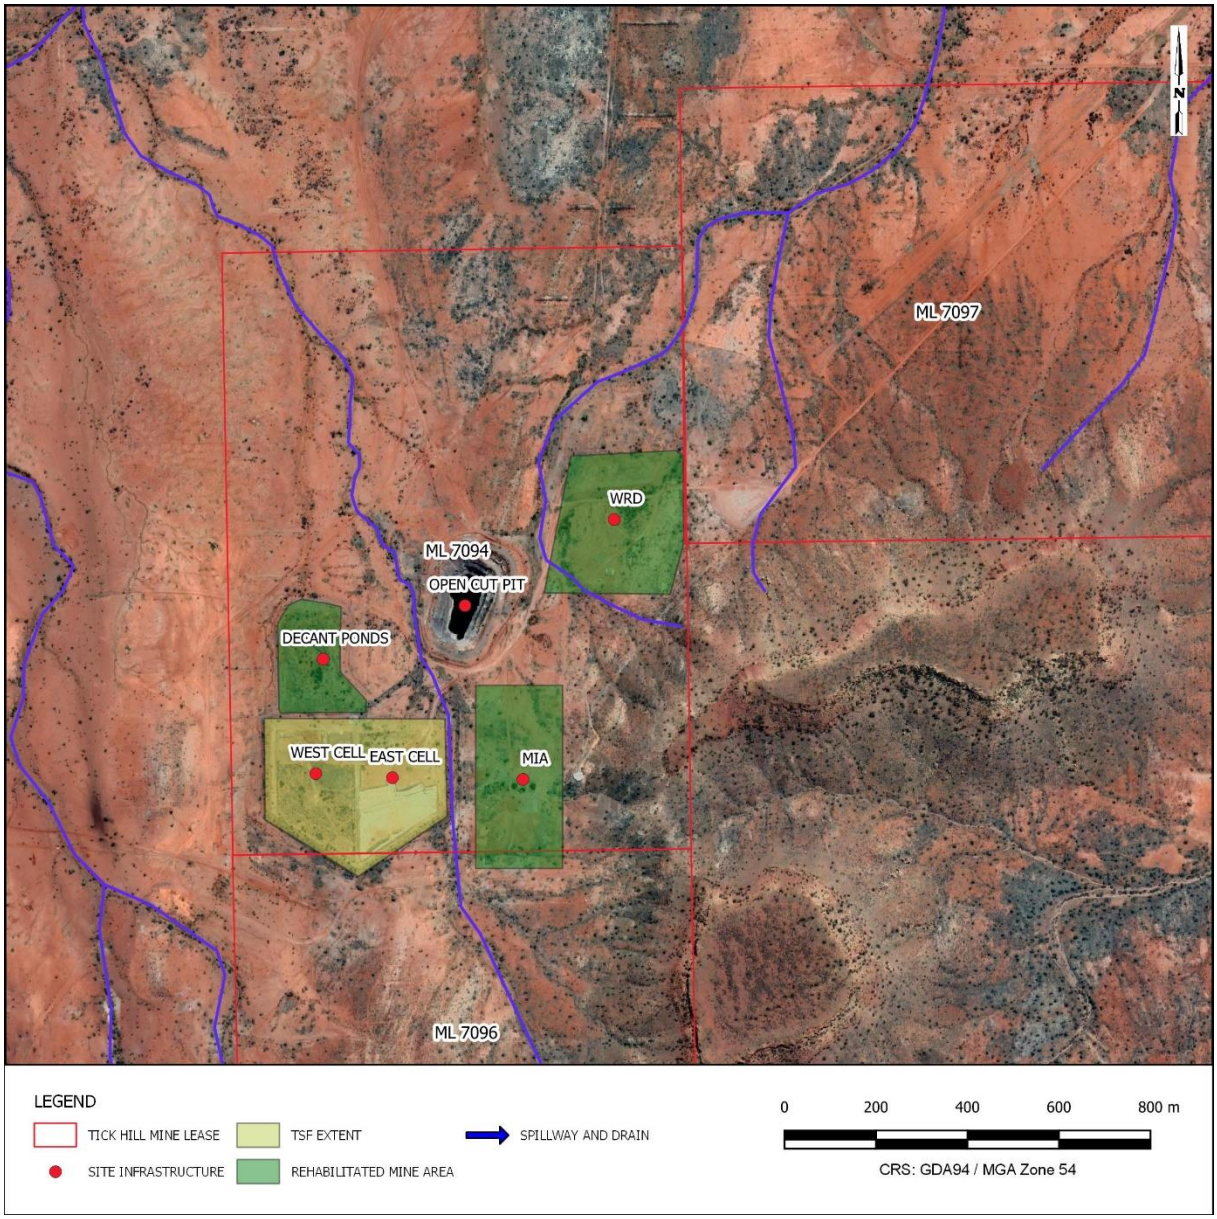
The CCA presented in this report is at a high level, based on desk top characterisation of the downstream receiving environments, but excluding a detailed dam break modelling. Given the setting of the site and near region, runout distances under a dam break and release scenario have been estimated empirically. It is noted that no consequence category has been specified for the existing TSF in the EA **[1]**. Furthermore, no engineering analyses have been undertaken to assess the stability or integrity of the TSF, being interpreted from available documentation; with no site inspection to ground truth existing site conditions included as part of the study scope.

1.2 Site Description

The Tick Hill Mine site is currently not in operation. Subsequent to previous mineral exploration and processing at the site, the TSF, waste rock dump, process areas and other mine impacted areas were rehabilitated. The existing site layout is depicted on **Map 2**. The Mine Infrastructure Area (MIA) includes the ROM Pad, Processing Plant, Workshop, Administration Office and Borrow Pit.

TAILINGS.WATER.WASTE.

MAP 2: MINE SITE LAYOUT



1.3 Existing TSF Configuration

The existing TSF is comprised of an East Cell and West Cell, separated by an internal bund. An emergency spillway is located on the northern face, which directs flows towards the open cut pit via a constructed drain. The historical decant water storage pond was formed immediately north of the West Cell, however this area has since been rehabilitated.

The TSF was formed as an elevated impoundment, and it inferred that perimeter embankments have been constructed in single stages using earthfill materials. As such the storage has no external catchment, with rainfall and runoff over the TSF surface area forming the only (post-closure) inputs.

It is understood that the floor of the storage is clay lined.

The existing configuration of the TSF is detailed in **Table 1**. This configuration represents conditions prior to reclamation works. Including capping materials, the existing TSF has a total in situ volume of approximately 600,000 m³.

TAILINGS.WATER.WASTE.

TABLE 1: TSF CONFIGURATION

Parameter	West Cell	East Cell
Maximum Landform Elevation (RL m)	351.5	352.0
Full Supply Level (RL m) (Internal Bund Spillway)	348.5	-
Full Supply Level (RL m) (Emergency Spillway Elevation)	-	346.7
Estimated Maximum Reclaimable Volume (ML)	245.9	203.3
Natural Ground Level (RL m)	341.0	341.5
Height to Natural Ground (m)	10.5	10.5
Surface Area (ha)	4.5	4.4

1.4 TRP Proposal

The Tick Hill development proposal, forming the basis of this CCA, is to recover tailings from the TSF for the purpose of reprocessing. It is understood that the tailings will be processed on site to form a concentrate that will be exported off site for further processing to recover the gold.

The reclamation procedure involves sorting and gravity separation and carbon filter to generate a gold concentrate. The process will separate the metalliferous fraction including gold and other heavy minerals, including cyanide compounds, leaving a low metalliferous lighter silicate minerals fraction. The silicate minerals fraction (naturally occurring silicate minerals) will represent approximately 90% of the tailings mass. The non- silicate fraction (0.4% of the tailings mass) will be transported offsite to a toll treat processing facility or smelter as a concentrate for process to extract the gold.

The process will commence by feeding tailings recovered from the TSF through a trommel at a rate of approximately 70tph, where water will be added to make a high-density pulp of 70% solids (wt/wt) and for dust mitigation. The pulp will then be continuously put through 3 gravity separators in two series of three units (around 1m^3 in size each).

The light fraction (silicates) making up about 99.6% of the total tailings stream will report back to the TSF, while the heavy (non-silicate) fraction of the stream (up to 0.4% of the feed), will be placed as a concentrated into containers for transport offsite for processing and gold recovery. The entire sorting process takes around 25 minutes for each load. The operation sorting plant will be serviced by loader or excavator. The entire operation will be undertaken within the confines of the TSF.

No process chemicals will be used in the process.

Process water will initially come from the Tick Hill pit. The Tick Hill pit water is low in metals as identified in the Tick Hill tailings geochemistry report provided as part of the supporting documentation. All water (small in quantity) that collects in the TSF as the light material returns to the TSF will be recycled continuously, passing through carbon filters, in order to significantly reduce (up to 99.6%) of the historic soluble stable CN complexes in the tailings. It should be noted that the TSF does not contain free cyanide, or WAD cyanide. The carbon used in filtration will be changed over regularly, with loaded carbon bagged and sent off-site for processing in a carbon processing elution circuit. Water addition from the pit will be limited to replenishment of water lost to evaporation.

The operation will be undertaken in a bunded and lined area of the TSF to minimise release of water used in the process.

The TRP will recover tailings in relation to the zones as shown in **Diagram 1**, comprising seven (7) zones in the eastern portion of the TSF (Zones E1 to E7) and three (3) zones in the western portion (Zones W1 to W3). The general arrangement will be to recover tailings from specific zones with non-reclaimed materials and tailings from on-site reprocessing placed in previously processed zones.

TAILINGS.WATER.WASTE.

It is proposed to reclaim tailings in the following stages **[3]** noting that Zone E1 and Zone E2 and part of Zone E3, E4 and E5 have already been reclaimed to an extent:

- Stage 1 – Remainder of Zone E3 and Zone E4 mined for onsite re-processing – non reclaimed materials placed in the Zone E1 and Zone E2 void.
- Stage 2 – Zone E5, Zone E6 and Zone E7 mined for onsite re-processing – non reclaimed materials placed in the Zone E3 and Zone E4 void.
- Stage 3- Zone W1 mined for onsite re-processing – non reclaimed materials placed in the Zone E5, Zone E6 and Zone E7 void.
- Stage 4- Zone W2 mined for onsite re-processing – non reclaimed materials placed in the Zone W1 void.
- Zone W3 is not to be re-processed.

Each of these zones are located on **DIAGRAM 1**.

It is proposed to retain the existing TSF spillway for operational purposes.

- 'Environmental Reports – Regional Ecosystems – Biodiversity Status', 18 March 2022, Department of Environment and Science **[15]**.

TAILINGS.WATER.WASTE.

2 SITE CONDITIONS

2.1 Climatic Conditions

The Köppen Climate classification of the region is a hot arid/desert climate (BWh). Highly variable rainfall occurs in the summer/wet season, which is typically hot and humid. The data obtained from the SILO Data Drill (The Long Paddock, 2022) **[11]** indicates that the mean annual rainfall for the region is 348 mm. The highest monthly rainfall occurs mostly in December through to March, as illustrated in **Chart 1**. The lowest monthly rainfall occurs in the winter months from April to October. **Chart 1** indicates that monthly potential evapo-transpiration (PET) evaporation rates exceed rainfall year-round at the Tick Hill Mine site.

CHART 1: AVERAGE ANNUAL RAINFALL AND PET ON A MONTHLY SCALE

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Rainfall	78.5	75.0	45.7	15.4	14.8	10.9	9.9	4.3	6.9	13.9	23.7	49.3
PET	218.0	185.8	188.8	158.9	125.7	100.6	111.3	142.1	175.9	215.5	224.7	232.4

2.2 Site Topography and Hydrology

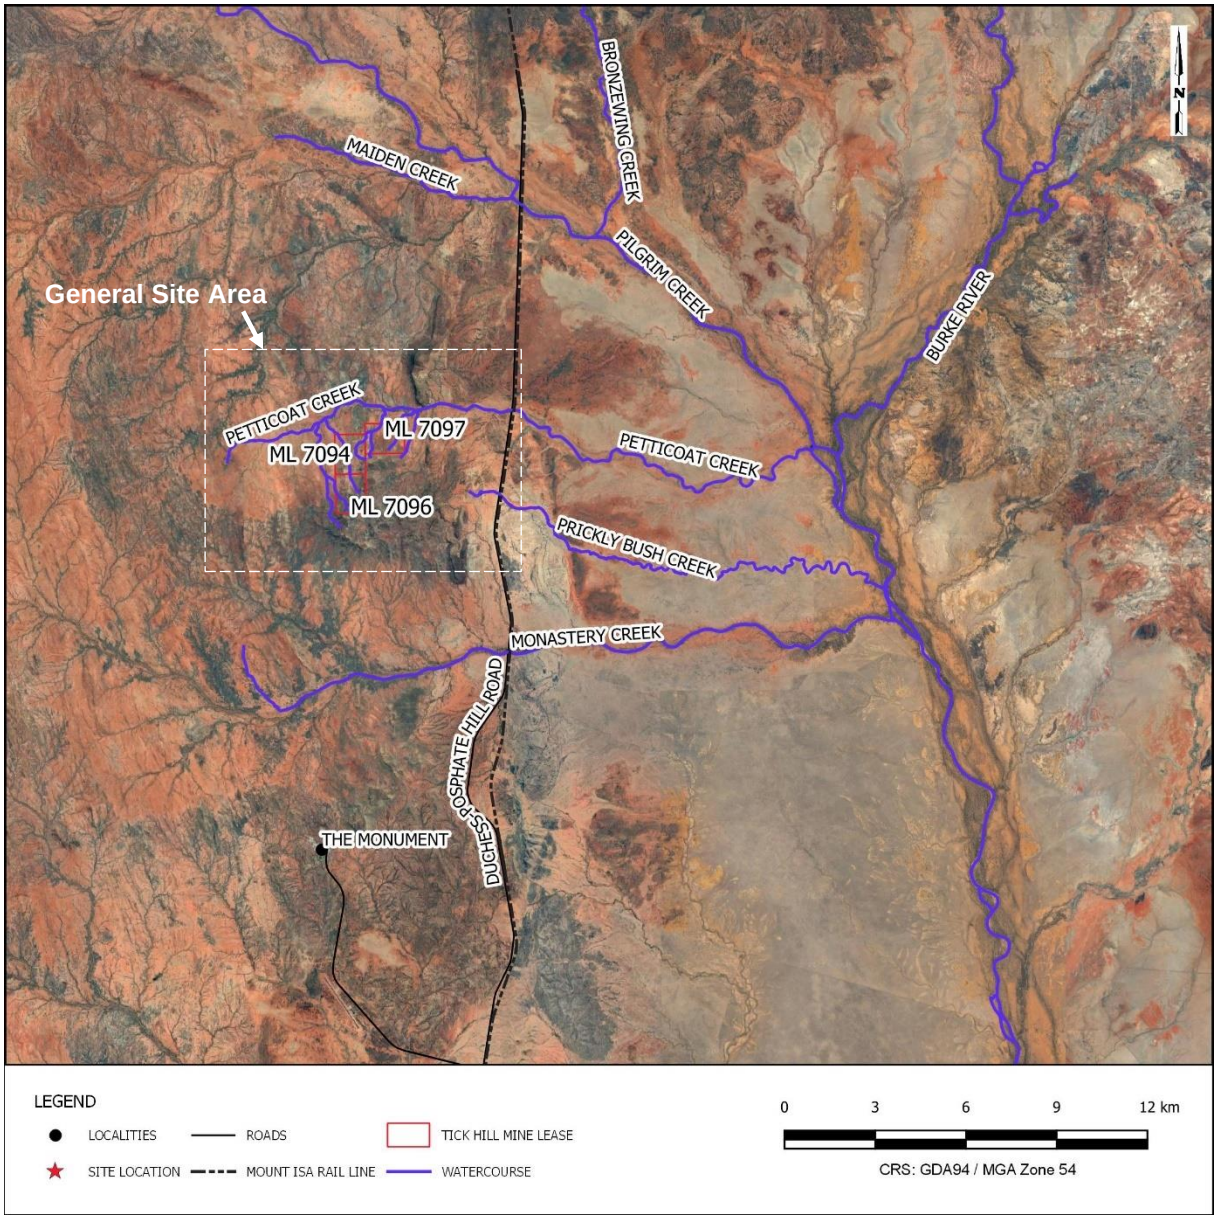
Regionally, the Tick Hill Mine is located across several unnamed tributaries of Petticoat Creek. The dominant unnamed tributary to the immediate east of the TSF travels approximately 1.8 km to the northwest where it outlets to Petticoat Creek. Approximately 5.6 km to the northeast of the site, Petticoat Creek crosses the Duchess-Phosphate Hill Road and the Mount Isa Rail Line.

More broadly, Petticoat Creek travels approximately 18 km to the east where it outlets to the Burke River. The Burke River flows in a southerly direction for approximately 193 km where it outlets to the Georgina River. The Georgina continues to flow south towards Lake Eyre.

The location of watercourses proximate to the Tick Hill Mine site, with drainage through Petticoat Creek and the Burke River are depicted on **Map 3**.

TAILINGS.WATER.WASTE.

MAP 3: DRAINAGE SYSTEM ADJACENT TO THE TICK HILL MINE SITE



2.3 General Surrounds

The Tick Hill mine site is remotely located, with no towns, villages or residences/homesteads located nearby (generally within 5 km). The only "sensitive receptor" from the mining operation's perspective is incidental motorists along the Duchess – Phosphate Hill Road located to the east (and topographically downstream) from the site.

Generally, the land use of the region is low density cattle grazing, with the inability to support any cropping or intense grazing. The presence of the general public or landowners near to the site is therefore remote/infrequent.

2.4 Subsurface Conditions (Geology and Hydrogeology)

Investigation of available surface geology data from 'Queensland Globe' **[10]** determined that the Tick Hill Mine site is located within the Corella Formation (PLkc), with mixed siliciclastic/carbonate rocks being typical.

TAILINGS.WATER.WASTE.

Due to the installed clay liner in the TSF, the potential for seepage from the storage is understood to be very low, with any seepage being directed to the open cut. This condition is supported by PSM **[4],** which determined:

- Rainfall over the structure will be available for evapotranspiration,
- The Open Cut Pit is linked to an upper unconfined valley aquifer beneath the Tick Hill site,
- The Open Cut Pit receives groundwater flows from the area to the north at a rate of approximately 0.35 L/s
- Any seepage from the TSF will drain in a north easterly direction, reporting to the Open Cut Pit.

2.5 Groundwater Setting and Quality

The TSF is located above an upper unconfined valley aquifer which is intercepted by the Pit. The Pit receives inflows from the upper unconfined valley aquifer and a deeper valley confined (regolith) aquifer **[5]** with average inflow rates of 0.36 L/s. Approximately 0.01 to 0.1 L/s of this inflow is from the TSF **[5]**. The Pit forms the local groundwater sink.

Water quality from the regolith aquifer is reported in BCM **[7] [8] [9]**, with sampling carried out from groundwater monitoring sites located as depicted on **Map 4**. THGW001, THGW003 and TWGW004 monitor mine affected aquifer areas, and THGW002, THGW005 and THGW006 monitor background or reference areas aquifer.

Groundwater sampling was last undertaken in June 2020, January 2021 and June 2021, with results summarised in **Table A1**, **Table A2** and **Table A3** in **Appendix A**. Where sampled analytes exceed the EA release limits, these values are highlighted in red.

TAILINGS.WATER.WASTE.

MAP 4: GROUNDWATER SAMPLING LOCATIONS

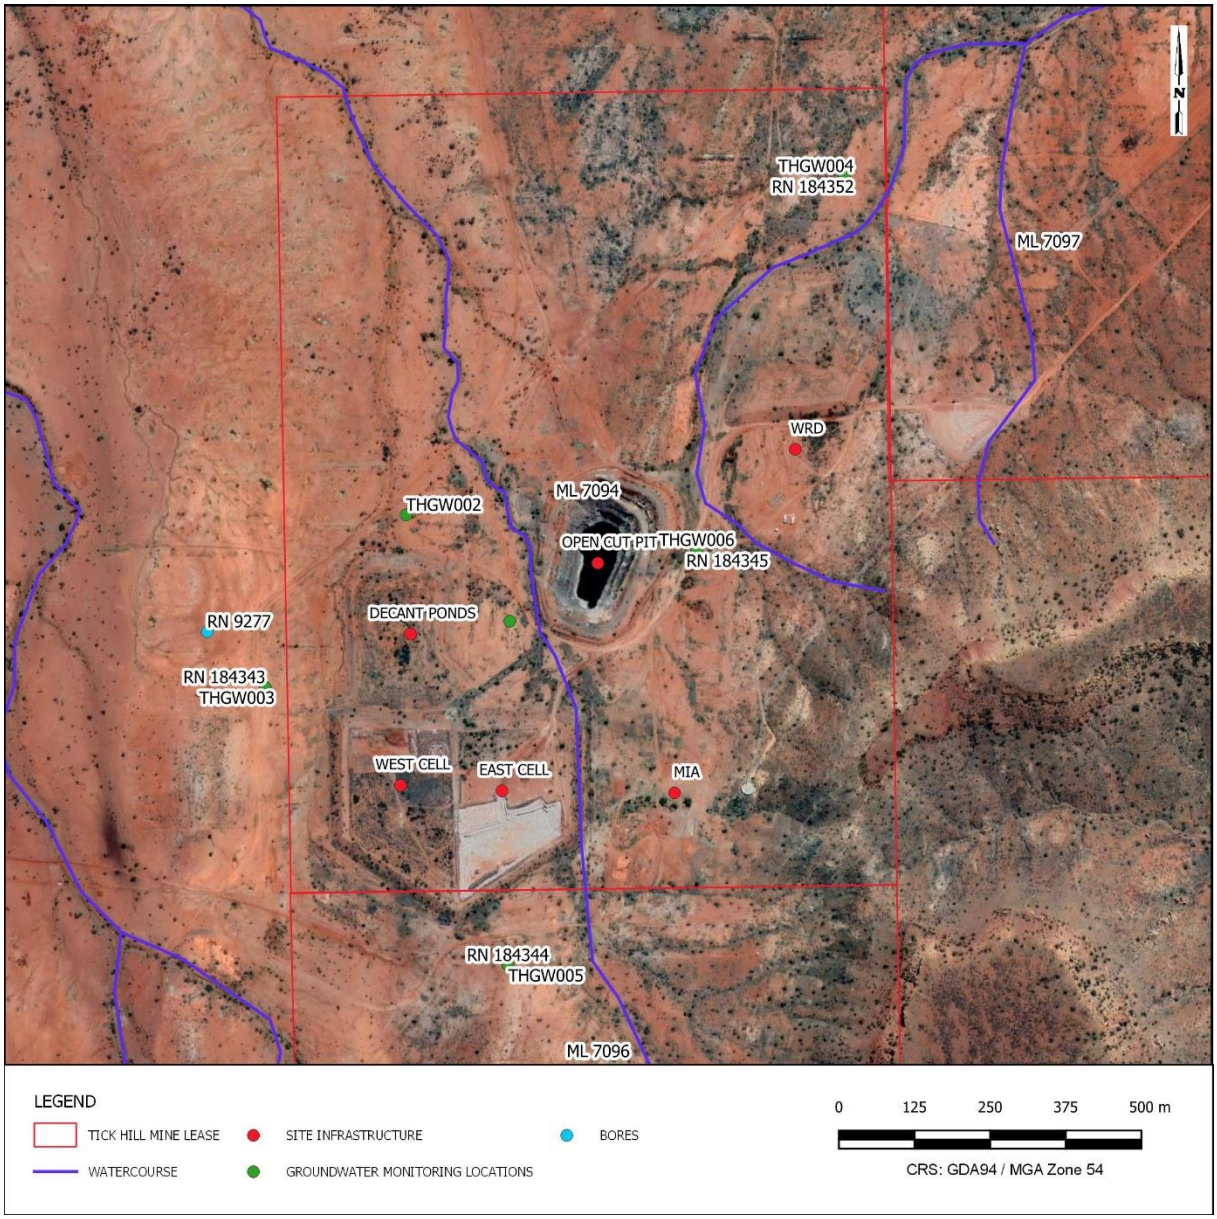


TABLE 2: REGISTERED LOCAL BOREHOLES ON ML7094, ML7096, ML 7097 AND SURROUNDS

EA Monitoring Point	Registered Bore Reference
THGW001	N/A
THGW002	N/A
THGW003	RN184343
THGW004	RN184352
THGW005	RN184344
THGW006	RN184345

TAILINGS.WATER.WASTE.

The results from recent groundwater sampling (refer **Appendix A**) indicate that groundwater from within the limits of the site and near surrounds can be characterised as being slightly alkaline (pH between 8.0 and 8.4) and slightly saline (EC between 1,200 µs/cm and 2,900 µs/cm) and against ANZECC water quality guidelines, would be generally suitable for use as stockwater. Access to groundwater for water resource purposes (stockwater or potable water for humans), beyond the boundary of the mine site, is unlikely to be feasible due to the considerable depth to groundwater and the limited yield/sustainability of the aquifer.

2.6 Groundwater Supply and Monitoring

Table 3 provides a summary of the local registered private boreholes within ML7094 (which extends 1.0 km to the north of the TSF) and Lot 13 on SP223510, which extends 55 km to the east of the TSF. The location of the borehole's relatives to the TSF are shown on **MAP 5**. The majority of bores identified are associated with monitoring at the Tick Hill mine site. There are two additional bores for which details were not publicly available. As such the impacts to those bores could not be assessed. Bore RN5179 is located almost 3.5 km to the west of the site and is outside the expected zone of impact in the event of a failure. RN9277 is located is close proximity to RN184343.

TABLE 3: REGISTERED LOCAL BOREHOLES ON ML7094, ML7096, ML 7097 AND 0137 AND LOT 13 ON SP223510

Local Bore Locations and Details					
Bore*	Coordinates (GDA94, Zone 54)		Location on Site	Date Drilled	Type/Role
	Easting	Northing

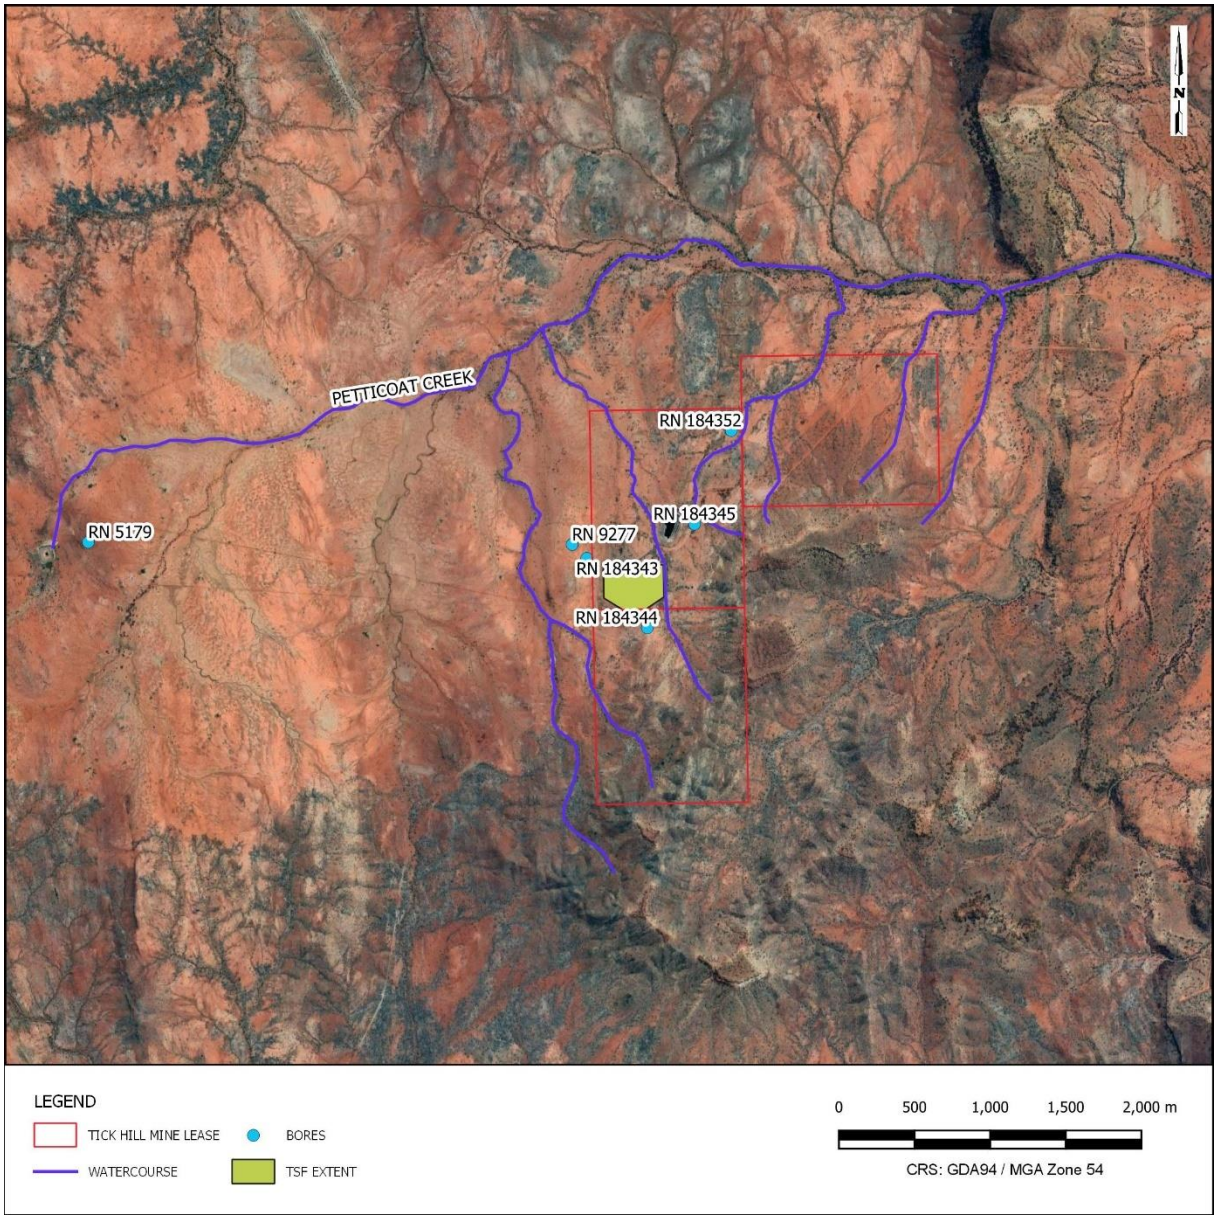
*Details provided by Queensland Globe **[10]** and Business Queensland **[16]**. Accessed 4 March 2022.

TAILINGS.WATER.WASTE.

MAP 5: BORES ADJACENT TO SITE LOCATION



Exposure to, and interaction with the upper level unconfined valley aquifer is limited by depth and permeability. There are no identified beneficial groundwater uses within the 5km of the site. Any seepage that does express from the TSF reports to the pit via the upper level unconfined valley aquifer. Degradation of groundwater quality is expected to be minimal , with any degraded groundwater reporting to the Pit where it forms a local groundwater sink.

TAILINGS.WATER.WASTE.

3 GENERAL ENVIRONMENTAL HARM ASSESSMENT

3.1 General

In assessing the consequence category for the TSF in accordance with the Manual **[2]**, the CCA is undertaken against the following 'potential harm' scenarios:

- harm to humans,
- general environment harm, and;
- general economic loss or property damage.

Context in relation to these aspects based on the setting of the site as described in **Section 2** is provided as follows. In summary, given this setting, the key impact of consideration is General Environmental Harm.

3.1.1 Harm to Humans

Potential harm to humans can occur through a failure to contain (e.g. spillway discharge, foundation or embankment seepage) or dam break scenario, whereby humans are within the zone of the discharge.

Subject to the Manual **[2]**, exposure to humans is to those people other than site personnel or people engaged in on-site work. Subject to a failure to contain event, exposure to humans would occur if present within the spillway discharge pathway or if accessing water (either surface water or groundwater) that is impacted by the release. Subject to a dam break,

In general terms, the risk of exposure to humans resulting from a failure to contain or dam break event would be low to very low given the setting of the site.

3.1.2 General Environmental Harm

When considering general environmental harm, the receiving environment for the failure of the TSF has been taken to include, but not limited to, ephemeral waterways, creeks and rivers within a 20 km flow path from the TSF. The receiving environment for the TSF to the north and east therefore includes:

- The unnamed tributary of Petticoat Creek traversed by the existing site development; and
- Petticoat Creek.

The Burke River is located outside this 20km limit.

In accordance with the Manual, general environment harm considers effects to areas with 'Significant Values' and 'Moderate Values' within the receiving environment. Such values are defined as follows.

- Significant Values
  - Matters of National Environmental Significance (MNES)
  - Matters of State Environmental Significance (MSES)
  - High Ecological Value (HEV) waters as per the Queensland Environmental Protection (Water) Policy 2009 (EPP Water).
- Moderate Values
  - Slightly or moderately disturbed waters as per the EPP Water
  - Wetland of general ecological significance (GES) as mapped on the Queensland Government referable wetland mapping
  - Riverine areas, springs or lakes and associated flora and fauna.

TAILINGS.WATER.WASTE.

The characteristics and exposure of these receiving environments, are identified in the environmental assessment reports in **Appendix B – EPBC Act Protected Matter Report** , **Appendix C – Environmental Reports - Matters of State Environmental Significance**, **Appendix D – Environmental Reports – Biodiversity and Conservation Values – Biodiversity Planning Assessments and Aquatic Conservation Assessments** and **Appendix E – Environmental Reports – Regional Ecosystems – Biodiversity Status**. Further assessment of potential environmental harm related to a failure to contain or dam break scenario is provided in **Section 4**.

3.1.3 General Economic Loss or Property Damage

Economic loss or property damage relates to the operation as well as any businesses, property or asset located beyond the site extent, which includes clean-up of any release.

Regardless of the site setting, clean-up of a large release is a major consideration subject to a TSF release. The impact on the business of the operation, through financial impact as part of clean up and restoration as well as on business reputation is also a critical aspect.

Within the expected failure path or impact area, there are no identified third party property or assets (including residential structures) that would require, repair, remediation or rehabilitation. Duchess Phosphate Hill Road is located approximately 5.6 km to the east of the site but is not expected to be impacted by a failure to contain (seepage or overtopping) or failure to contain (dam break) (**Section 4.3**) scenarios.

3.2 Potential Environment Impacts

The relevant characteristics of the unnamed tributary of Petticoat Creek and Petticoat Creek in the context of environmental values, were assessed from the following sources:

- Matters of National Environmental Significance
- Matters of State Environmental Significance
- High Ecological Value Wetlands and Waterways
- Aquatic Conservation Significance
- Registered Private Bores

The relevant information from each of these data sources are discussed in the following sub-sections, with reference to data provided in **Appendices B** to **E**. The unnamed tributary of Petticoat Creek and Petticoat Creek are ephemeral watercourses, and as such only flow during and after periods of significant rainfall.

3.2.1 Matters of National Environmental Significance

The Protected Matter Report (PMR) **[10]** for the Tick Hill Mine site, is provided in **Appendix B.** This report lists the MNES that may occur within a 5 km buffer of ML7094, ML7096 and ML7097. It includes locations upstream and downstream of the project area, as well as locations in adjacent catchments.

There are no World Heritage Properties, National Heritage Places, Wetlands of International Importance, Great Barrier Reef Marine Park, Commonwealth Marine Area or Listed Threatened Ecological Communities listed for the receiving environment in the PMR **[10]**.

The PMR **[10]** contains 9 Listed Threatened Species and 10 Migratory Species listed for the receiving environment. The critically endangered and endangered animals listed in the PMR **[10]** report is summarised in **Table 4**. The PMR lists the potential for species or species habitat to occur within the search areas. Detailed flora and fauna survey can be undertaken to quantify the actual occurrence of species and species habitat.

TAILINGS.WATER.WASTE.

TABLE 4: MNES LISTED CRITICALLY ENDANGERED AND ENDANGERED ANIMALS

Name	Scientific Name	Status	Comments
Curlew Sandpiper	Calidris Ferruginea	Critically Endangered	Species or species habitat may occur within area (Bird)
Night Parrot	Pezoporus occidentalis	Endangered	Species or species habitat likely to occur within area (Bird)
Australian Painted Snipe	Rostratula australis	Endangered	Species or species habitat may occur within area (Bird)

3.2.2 Matters of State Environmental Significance

There are several areas of Matters of State Environmental Significance (MSES) **[13]** within ML7094 (which extends 1.0 km to the north of the TSF) and Lot 13 on SP223510, which extends 55 km to the east of the TSF pertaining to:

- Wildlife habitat (special least concern)
- Wildlife habitat (endangered or vulnerable)
- Regulated vegetation (intersecting a watercourse) along the unnamed tributary of Petticoat Creek; and,
- Regulated vegetation (essential habitat) to the east and upstream of the TSF extents .

These areas are shown in the MSES documentation in **Appendix C – Map 3a** and **Map 4**.

3.2.3 High Ecological Value Wetlands and Waterways

Assessment of the available data MSES data **[13]** (**Appendix D**) shows that no High Ecological Value (HEV) wetlands or waterways have been identified in the receiving environment within ML7094 (which extends 1.0 km to the north of the TSF) and Lot 13 on SP223510, which extends 55 km to the east of the TSF.

3.2.4 Aquatic Conservation Significance

Petticoat Creek (and its unnamed tributary) is located in the Mitchell Grass Downs and Northwest Highlands bioregions, the Southwestern Downs and Mount Isa Inlier subregions, which are all within the Georgina River catchment. The unnamed tributary of Petticoat Creek and Petticoat Creek were assessed against the characteristics for riverine areas, lakes and springs, as per the Queensland Government Wetland Maps **[13].**

Review of the available wetland mapping, MNES **[10]**, MSES **[13]**, Biodiversity and Conservation Values **[14]** and Regional Ecosystems **[15]** did not identify any riverine waterbodies in the unnamed tributary of Petticoat Creek and Petticoat Creek.

The unnamed tributary of Petticoat Creek and Petticoat Creek were identified as areas of 'Low' riverine subcatchment significance as depicted in **Appendix E – Map 5**.

TAILINGS.WATER.WASTE.

4 SIMPLIFIED DAM BREAK ASSESSMENT

4.1 General

The initial operations at Tick Hill reclaimed in situ tailings and were transported off site for processing, therefore residual capacity has been formed within the TSF. The permitted tailings reclamation involves establishing the processing plant within the tailings precinct, reclaiming in situ tailings, processing the reclaimed tailings and backfilling the treated tailings in available void space within the TSF, followed in time by progressive placement of a low risk cap and topsoil consistent with the previously constructed capping profile.

Beyond that time, once on site processing facilities have been established, while tailings will continue, capacity will be used for placement of residual tailings. Either way, it has been assumed that in the event of a dam break failure, mine impacted waters will be potentially available for release, with no significant quantity of residual tailings solids being mobilised. This assumption is conservative to the extent that the inundation reach under a release of water will be further than of tailings solids.

The TSF was originally constructed in the early 1990's. There is no evidence of failure subsequent to its closure and remediation.

The reclamation of tailings involves the construction of a decant pond within the TSF of approximately 24.3 ML (at maximum volume) with an active operational volume of approximately 6 ML. the location of the decant within the TSF will move throughout the reclamation process.

4.2 Failure Scenario and Credibility

4.2.1 Hydrologic Scenarios

In undertaking an empirical dam break assessment, the following two (2) hydrologic scenarios were considered:

- Sunny Day Failure
- Flood Day Failure

The Sunny Day Failure (SDF) represents a scenario whereby a sudden failure occurs during normal operating conditions with no rainfall present, such as failure modes induced by static (load-induced) liquefaction, dynamic (earthquake-induced) liquefaction, slope instability (foundation failure, differential settlement), and internal erosion (piping) leading to an impoundment failure. Although such a failure mechanism is typically non-flood producing, failure to contain events may involve the release of contaminants, which could endanger environmental values or human life/wellbeing.

The Flood Day Failure (FDF) represents a scenario whereby the dam is subjected to a flood event equivalent to the capacity of the emergency spillway and routed through the storage at Full Supply Level (FSL). Dam break would then be triggered with a Probable Maximum Precipitation (PMP) event occurring concurrently and leading to overtopping and the partial or complete collapse of the structure. The PMP is defined as 'the greatest depth of precipitation for a given duration meteorologically possible for a given size storm area at a particular location at a particular time of year' (WMO, 2009) **[22]**.

Of these two possible hydrologic scenarios, only the SDF was considered for impacts due to the high level assessment of this CCA.

4.2.2 Storage Scenario

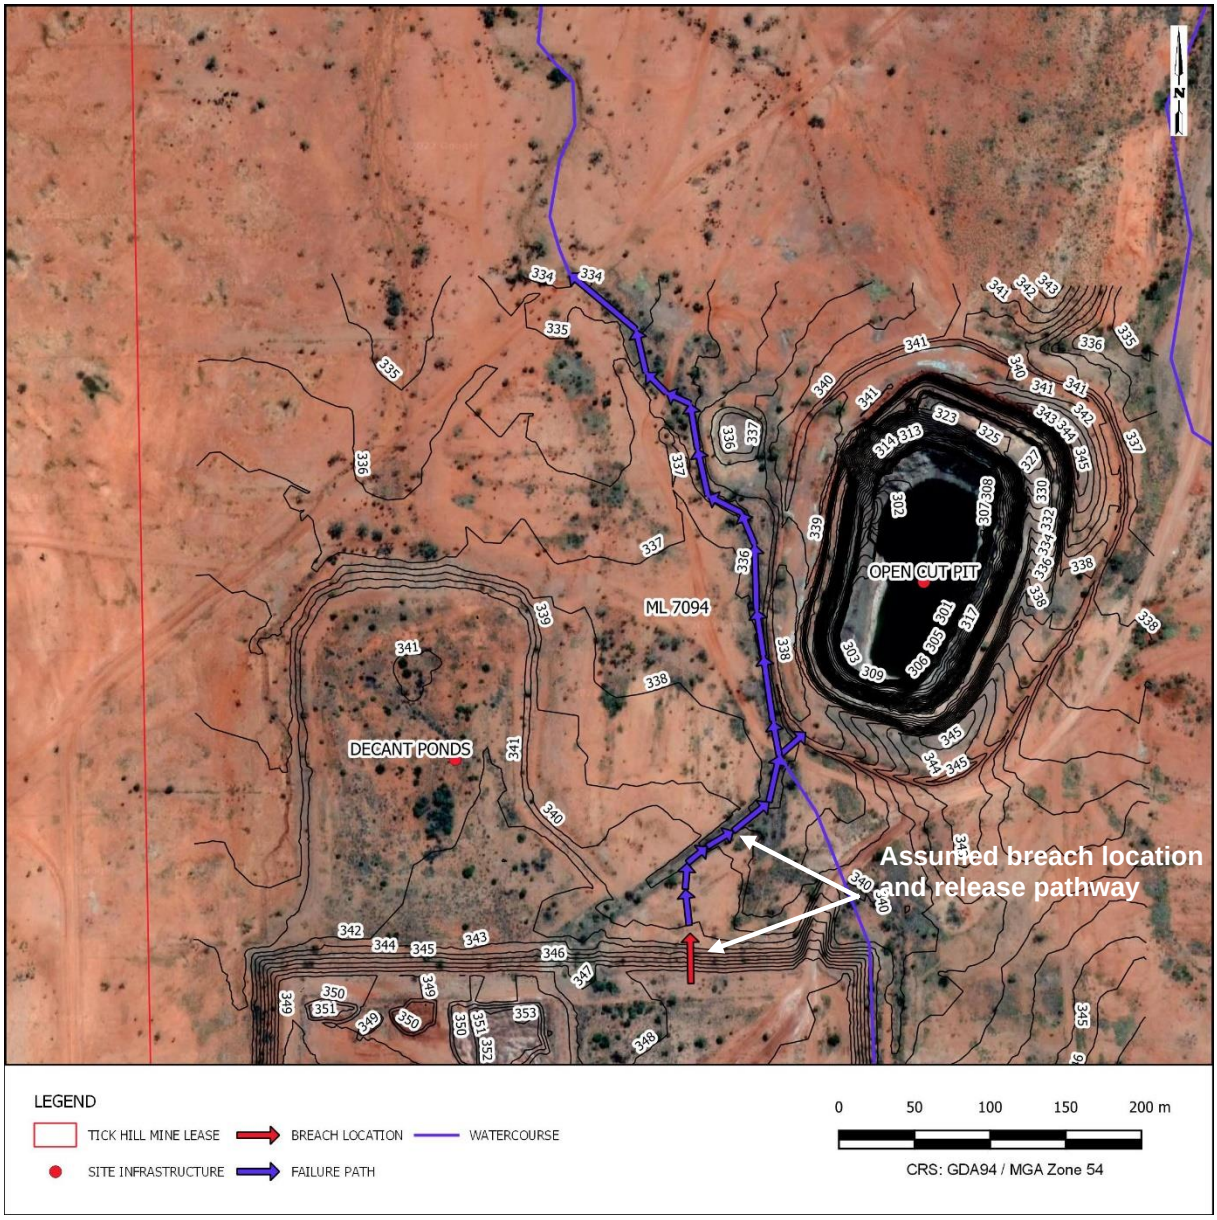
A dam break under the conditions as described in **Section 4.2.1** (for the SDF) is assumed to occur along the northern embankment, exposing the adjacent tributary of Petticoat Creek, and therefore anticipating the greatest impact. This is deemed to coincide with Stage 3 development, refer **Section 1.4,** at the time that a maximum storage volume will exist against the northern embankment. The maximum stored water at this time is expected to be 24.3 ML.

TAILINGS.WATER.WASTE.

It is noted that a failure from the West Cell was not considered, given that Zone W3 located against the northern embankment will not be mined, therefore a significant separation between the pond area and the northern embankment will exist.

The assessed breach location in Zone E6/Zone E7 and failure path is shown on **Map 6**. The primary failure path is expected to be towards the open cut pit, with some minor flows bypassing into the unnamed tributary of Petticoat Creek.

MAP 6: BREACH LOCATION



4.3 Runout Volume and Distance

The potential runout distance from the dam break scenario described in **Section 4.2.2** can be estimated based on

EQUATION 1 from Rico et al **[18]**, and is detailed in **Table 5**. .

TAILINGS.WATER.WASTE.

EQUATION 1: D_{MAX}

$$D_{MAX} = 1.61\ (H\ V_F)^{0.66}\ \text{km}$$

Where: V_F = Total volume of water and tailings released (GL)

H = Failure Height (m)

TABLE 5: SUMMARY OF SIMPLIFIED DAM BREAK SCENARIO

Parameter	SDF
Volume of Water – V_w (ML)	24.3
Volume of Failure – V_F (ML)	24.3
Failure Height – H (m)	10.5
Runout Distance (km)	0.65

As can be seen from **Table 5**, the estimated runout distance is 0.65 km. This represents a failure form the Eastern Cell. A failure of the Western Cell was not considered credible, as described in **Section 4.2.2**.

A comparison was made against the Department of Natural Resources, Mines and Energy's (DNRME) 'Guideline for failure impact assessment of water dams' **[23]** indicative failure impact zones for initial assessments. As dam break assessment assumed a full release of impounded waters from the East Cell, this comparison was considered suitable.

Table 5 of DNRME **[23]**, indicates that a failure volume of up to 200 ML has a total downstream failure impact of 5 km. As the failure volume of 24.3 ML has a runout distance of 0.65 km, this was considered to be an appropriate estimate for the high level nature of this assessment.

4.4 Population at Risk

Population at Risk (PAR) is a key indicator in characterising off property impacts associated with a dam break scenario. PAR is defined as people other than site personnel or people engaged in on-site work, therefore limited to the general public located in the failure impact zone at the time of failure. Based on this definition, the most likely locations of impact to non-site personnel are the general public travelling on Duchess-Phosphate Hill Road.

Traffic data for the Duchess-Phosphate Hill Road was not publicly available. As such, the nearest state controlled Road (Cloncurry-Dajarra Road) was utilised. Traffic data was available from the intersection with Duchess-Phosphate Hill Road, extracted from the 'Traffic census of the Queensland state-declared road network – 2019' **[21]**. The Annual Average Daily Traffic (AADT) was stated as 69 at this location. The PAR can be calculated based on AADT by **Equation 2 [23].** The parameters used to calculate the PAR on the Duchess-Phosphate Hill Road are detailed in **Table 6**.

EQUATION 2: POPULATION AT RISK FROM AADT

$$PAR = \frac{(AADT\ x\ Nv)}{24\ x\ (\frac{60}{Thaz})}$$

TAILINGS.WATER.WASTE.

TABLE 6: POPULATION AT RISK

Parameter	Value
AADT	69
Nv (Number of persons per vehicle)	1.5
Length of Road Impacted (m)	730*
Gazetted Speed Limit (km/hr)	100*
T_{haz} (Hazard Exposure Time) (minute)	0.63 (38 sec)
Population at Risk	0.03

*Based on assessment via Google Earth

As can be seen in **Table 6**, the estimated PAR is 0.03. This value has been rounded down to 0 as Duchess-Phosphate Hill Road is located approximately 7.4 km downstream of the site, which exceeds the estimated runout distance of 1.50 km. It can be concluded therefore that there is no PAR in the event of a dam break.

TAILINGS.WATER.WASTE.

5 CONSEQUENCE CATEGORY ASSESSMENT

5.1 Basis of the Consequence Category Assessment

The TSF was assessed against the requirements of the Manual **[2]** subject to operational site conditions. This involved a desktop review of site setting and details of receiving environments, and assessment of potential harm associated with failure-to-contain and dam break scenarios. Background to this assessment is summarised in **Sections 2, 3** and **4**.

5.2 Consequence Category Assessment Regulatory Requirements

The Manual sets out the requirements of the administering authority for a CCA and certification of the design of regulated structures, constructed as part of environmentally relevant activities under the Environmental Protection Act (1994) **[20]**.

The purpose of the Manual is to:

- *Guide the assessment of the Consequence Category of all structures constructed as part of activities that require an EA or development approval;*
- *Guide the determination of the structure(s) that require formal documentation; and*
- *Provide approved methods for specifying the design performance and monitoring requirements for those structures.*

Assessment criteria for CCA is based on the following failure event scenarios.

- Failure to Contain – Seepage

  Spills or release to ground/groundwater via seepage from the floor and/or sides of the structure. This is only relevant to a new structure and does not apply to structures approved prior to development of the current version of the Manual. As such, a seepage failure has not been completed.

- Failure to Contain – Overtopping

  Spills or releases from the structure that result from loss of containment due to overtopping of the structure.

- Failure to Contain – Dam Break

  Collapse of the structure due to any possible cause.

Under these scenarios, several modes of failure are possible as described below:

- A failure to contain scenario means a release from the structure that results from loss of containment due to overtopping of the structure and/or other deficiencies in water management aspects of the storage. Although such a failure mechanism is typically non-flood producing, failure to contain events may involve the release of contaminants, which could endanger environmental values or human life/wellbeing.
- A dam break scenario involves the partial or complete collapse of a structure due to any possible cause. For the purposes of CCA, a simplified empirical dam break assessment was undertaken for the proposed Zone E5, Zone E6 and Zone E7 north towards the open cut pit, assuming the following:
  - The void made by the TRP associated with the Stage 3 works of Zone E5, E6 and E7 was full to the embankment crest level; and,
  - Full failure of above ground embankment to natural ground level allowing the release of 24.3 ML

TAILINGS.WATER.WASTE.

The criteria adopted for the assessment of Consequence Category reproduced from the Manual is reproduced in **Table 7**. Assessments against the failure scenarios following the Manual for the TSF were undertaken. This assessment is contained in **Table 8**.

TAILINGS.WATER.WASTE.

TABLE 7: CONSEQUENCE CATEGORY ASSESSMENT CRITERIA (DES 2016) [2]

Environmental Harm	Consequence Category		
	High	**Significant**	**Low**
Harm to Humans	Location such that people are routinely present in the failure path and if present loss of life to greater than 10 people is expected[8]. Note: The requirement to consider the location of people in the failure path is only relevant to the 'dam break' scenario.	Location such that people are routinely present in the failure path and if present loss of life to 1 person or greater but less than 10 people is expected[7]. Note: The requirement to consider the location of people in the failure path is only relevant to the 'dam break' scenario.	Location such that people are not routinely present in the failure path and loss of life is not expected[7]. Note: The requirement to consider the location of people in the failure path is only relevant to the 'dam break' scenario.
	Location such that contamination of waters (surface and/or groundwater[9]) used for human consumption could result in the health of 20 or more people being affected[10].	Location such that contamination of waters (surface and/or groundwater[8]) used for human consumption could result in the health of 10 or more people but less than 20 people being affected[9].	Location such that contamination of waters (surface and/or groundwater[8]) used for human consumption could result in the health of less than 10 people being affected[9].
General environmental harm	Location such that: a) Contaminants may be released to areas of MNES, MSES or HEV waters that are not already authorised to be disturbed to at least the same extent under other conditions of this authority subject to any applicable offset commitment (Significant Values); and b) Adverse effects[11] on Significant Values are likely; and c) The adverse effects[10] are likely to cause at least one of the following: i) loss or damage or remedial costs greater than $50,000,000; or ii) remediation of damage is likely to take 3 years or more; or iii) permanent alteration to existing ecosystems; or iv) the area of damage (including downstream effects) is likely to be at least 5 km².	Location such that contaminants may be released so that adverse effects[10] (that are not already authorised to be disturbed to at least the same extent under other conditions of the authority subject to any applicable offset commitment) either: a) Would be likely to be caused to Significant Values but those adverse effects[10] would not be likely to meet the thresholds for the High Consequence Category and instead would be likely to cause at least one of the following: i) loss or damage or remedial costs greater than $10,000,000 but less than $50,000,000; or ii) remediation of damage is likely to take more than 6 months but less than 3 years; or iii) significant alteration to existing ecosystems; or iv) the area of damage (including downstream effects) is likely to be at least 1km2 but less than 5 km². or b) Would be likely to be caused to environmental values classed as slightly or moderately disturbed waters[12], wetland of general ecological significance[13], riverine areas, springs or lakes and associated flora and fauna (Moderate Values), and the adverse effects[10] are likely to cause at least one of the following: i) loss or damage or remedial costs greater than $20,000,000; or ii) remediation of damage is likely to take more than 1 year; or iii) significant alteration to existing ecosystems; or the area of damage (including downstream effects) is likely to be at least 2 km².	Location such that either: a) Contaminants are unlikely to be released to areas of Significant Values or Moderate Values; or b) Contaminants are likely to be released to those areas, but would be unlikely to meet any of the minimum thresholds specified for the Significant Consequence Category for adverse effects[10]
General economic loss or property damage	Location such that harm (other than a different category of harm as specified above) to third party assets in the failure path would be expected to require $10 million or greater in rehabilitation, compensation, repair or rectification costs[14].	Location such that harm (other than a different category of harm as specified above) to third party assets in the failure path would be expected to require $1 million and greater but less than $10 million in rehabilitation, compensation, repair or rectification costs[13].	Location such that harm (other than a different category of harm as specified above) to third party assets in the failure path would be expected to require less than $1 million in rehabilitation, compensation, repair or rectification costs[13] .

7 To be used for all failure event scenarios

8.'People routinely present in the failure path' could be considered to be people who occupy buildings or other places of occupation that lie within the failure impact zone. For the purposes of this Manual, this should refer to people other than site personnel engaged by the resource operation and located on the tenements and tenure associated with the resource operation; for other ERAs, it would be the 'premises referred to in the authority'. It should be noted that while this is appropriate for the assessment of consequence categories in accordance with this Manual, adherence to the requirements of this Manual does not limit, amend or change in any way, any other requirements to be complied with under relevant health and safety acts or legislation that requires the safety of site personnel to be considered.

9 When considering potential impacts on groundwater, it is not envisaged that a full hydrogeological assessment will be required in all cases. Any consideration of potential impacts on groundwater systems should consider the water quality of the potential receiving aquifer as well as the quality of fluid stored in the regulated dam. Existing groundwater drawdown in areas surrounding resource operations (e.g. drawdown as a result of mine pit or underground mine dewatering) can also be considered when assessing the consequence of dam seepage on groundwater systems.

10 'An adverse effect on human health means a physiological effect on human health and does not include an impact on the quality of downstream water that merely negatively affects taste and which is unlikely to cause persons to become physically ill.

11 Adverse effects includes chronic and acute effects where an acute effect is on living organism/s which results in severe symptoms that develop rapidly, and a chronic effect is an adverse effect on a living organism/s which develops slowly. In some instances, it may be necessary to carry out or reference existing ecological/toxicological studies to assess the impacts of contaminants on living organisms.

12 See Water EPP for definitions

13 Wetland of general ecological significance' means a wetland shown on a map of referable wetland as a 'general ecologically significant wetland' or 'wetland of other environmental value'.

14 This does not include the holder's own mine or gas production, on-site industrial or commercial assets, the holder's workers' accommodation, agricultural facilities on the holder's land such as a farm shed or farm dam or infrastructure solely for servicing the holder.

TAILINGS.WATER.WASTE.

TABLE 8: CONSEQUENCE CATEGORY ASSESSMENT

Environmental Harm	Consequence Category		
	Failure to Contain – Seepage	**Failure to Contain – Overtopping**	**Failure to Contain – Dam Break**
Harm to Humans	Under Section 2.1.2.1.a of the Manual **[2],** the assessment against the 'Failure to contain – seepage' scenario is applicable for new structures and does not apply to structures approved prior to development of Version 5.02 of the Manual. As the TSF is an existing structure, an assessment of 'Failure to contain – seepage' has not been undertaken.	In the event of an overtopping event, release of mine impacted water will occur through the TSF spillway and flow north along the unnamed tributary of Petticoat Creek. Overtopping flows may report to the Pit. An overtopping failure would typically result from the following: • Mismanagement of impounded surface waters • Prolonged extended rainfall exceeding containment criteria Overtopping flows is not expected to impact public roads, with no other areas where non-site personnel would be expected to be routinely present. There are no potable water sources (either surface water or groundwater) used for human consumption in the potential impact area. **Consequence Category is assessed as Low.**	In the event of a dam break failure of the TSF, it has been assumed that the release of mine impacted water resulting from impoundment failure will flow north along the unnamed tributary of Petticoat Creek. Flows may report to the Pit. The Duchess-Phosphate Hill Road is located approximately 7.3 km downstream of the TSF and will likely be affected by a dam break event. However, for this scenario, the Population at Risk (PAR) was assessed to be < 1. **Consequence Category is assessed as Low**
General environmental harm		In the event of an overtopping failure, release of mine impacted water will flow north along the unnamed tributary of Petticoat Creek. Overtopping flows may report to the Pit. Overtopping flows may impact the following areas of MNES and MSES: • Wildlife habitat (special least concern), • Wildlife habitat (endangered or vulnerable), • Regulated vegetation (intersecting a watercourse), and; • Regulated vegetation – essential habitat). Impact is expected to downstream areas of significant environmental value, but not meet the thresholds for a 'High' consequence. Impacts and likely consequences would likely include: 6) remediation of damage is likely to take more than 6 months but less than 3 years; or ii) the area of damage (including downstream effects) is likely to be at least 1 km^2 but less than 5 km^2. **Consequence Category is assessed as Significant.**	In the event of a dam break failure of the TSF, the release of mine impacted water will flow north along the unnamed tributary of Petticoat Creek. Flows may report to the Pit. Flows from a Dam Break event may impact the following areas of MNES and MSES: • Wildlife habitat (special least concern), • Wildlife habitat (endangered or vulnerable), • Regulated vegetation (intersecting a watercourse), and; • Regulated vegetation – essential habitat). Impact is expected to downstream areas of significant environmental value, but not meet the thresholds for a 'High' consequence. Impacts and likely consequences would likely include: 6) remediation of damage is likely to take more than 6 months but less than 3 years; or ii) the area of damage (including downstream effects) is likely to be at least 1 km^2 but less than 5 km^2. **Consequence Category is assessed as Significant.**
General economic loss or property damage	**Consequence Category is assessed as N/A.**	In the event of an overtopping failure, release of mine impacted water will flow north along the unnamed tributary of Petticoat Creek. Overtopping flows may report to the Pit. There are no third party assets in the potential failure area. However, a clean up liability along the length of impacted creek line would be required. Rehabilitation, repair or compensation would be expected to be less than $1 million. **Consequence Category assessed as Low.**	In the event of a dam break failure of the TSF, the release of mine impacted water will flow north along the unnamed tributary of Petticoat Creek. Flows may report to the Pit. There are no third party assets in the potential failure area. However, a clean up liability along the length of impacted creek line would be required, which would be reasonable extensive given the predicted impact area from the dam break assessment. Rehabilitation, repair or compensation would be expected to be more than $1 million, however less than $10 million. **Consequence Category is assessed as Significant.**
Overall Consequence Category	**N/A**	**SIGNIFICANT**	**SIGNIFICANT**

TAILINGS.WATER.WASTE.

6 SUMMARY AND DESIGN

A CCA has been undertaken in relation to the existing Tick Hill TSF, associated with a tailings reprocessing proposal (TRP). The CCA was completed in accordance with DES **[2]** with results summarised in **Table 9**.

TABLE 9: DES CONSEQUENCE CATEGORY ASSESSMENT SUMMARY

Failure Scenario	TSF
Failure to Contain – Seepage	N/A.
Failure to Contain – Overtopping	Significant
Failure to Contain – Dam Break	Significant
Overall	Significant
Regulated Structure, as defined in the Manual (Y/N)	Y

As shown in **Table 9**, the TSF has an overall consequence category of "**Significant**" and is therefore considered to be regulated structure.

Based on the above assessment, the preliminary hydraulic performance criteria to be applied to design and operation of the TSF are as detailed in **Table 10**.

TABLE 10: HYDRAULIC PERFORMANCE CRITERIA (DES 2016) [2]

Consequence Category	Spillway Capacity Criteria	Design Storage Allowance (DSA)	Extreme Storm Storage (ESS)
Significant	1:100 AEP to 1:1,000 AEP + wave runup for 1:10 AEP wind	1:20 AEP 3-month wet season	1:10 AEP 72 hr duration

A preliminary analysis to quantify DSA and ESS based on the criteria listed in **Table 10** has been undertaken in accordance with the Manual [2] and are detailed in **Table 11** and **Table 12** respectively.

TABLE 11: DESIGN STORAGE ALLOWANCE (DSA)

Parameter	West Cell	East Cell
Hazard Category	Significant	Significant
Design Risk	1:20 AEP, 3 month wet season	1:20 AEP, 3 month wet season
Rainfall Total	510 mm*	510 mm*
Catchment area (includes storage extents)	4.6 ha	4.6 ha
Runoff Coefficient	1.0	1.0
Calculated Runoff Volume	23.5 ML	23.5 ML
Process Inputs	6.0 ML	6.0. ML
DSA Volume	**29.5 ML**	**29.5 ML**

TAILINGS.WATER.WASTE.

*The Longpaddock SILO data drill for location -21.65S and 139.90E **[11]**.

It is noted that the DSA volume of 29.5 ML is greater than the volume of the decant pond of 24.3 ML. Ordinarily, this would result in a loss of containment, however, there is additional volume above the decant pond provided by the area of reprocessing. As such, sufficient storage will be available to contain the DSA.

TABLE 12: MANDATORY REPORTING LEVEL ASSESSMENT

Parameter	West Cell	East Cell
Hazard Category	Low	Significant
Design Risk	-	1:10 AEP, 72 hr duration
Rainfall Total	-	181 mm
Catchment area (includes storage extents)	-	4.6 ha
Runoff Coefficient	-	1.0
Extreme Storm Storage (ESS)	**-**	**8.3 ML**
Depth below Spillway Level to achieve Volume	-	Varies based upon staging
MRL	**-**	**TBD prior to 1 November based upon staging**

As noted in **Table 12**, the MRL in the East Cell will vary based upon the staging of works current as at 1 November. As such, the MRL will vary during the duration of the project. The MRL is to be re-applied to the decant pond at each stage of reclamation as the decant pond moves. An MRL for the Western Cell is not required.

Upon closure, it is understood a residual 60 ML void will remain within the Western Cell of the TSF.

These design and operating aspects should be confirmed based on criteria listed in **Table 10** as part of final development planning.

APPENDIX B – EPBC ACT PROTECTED MATTER REPORT

Australian Government
Department of Agriculture, Water and the Environment

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 18-Mar-2022

- Summary
- Details
  - Matters of NES
  - Other Matters Protected by the EPBC Act
  - Extra Information
- Caveat
- Acknowledgements

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	9
Listed Migratory Species:	10

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	15
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	2
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Listed Threatened Species			[Resource Information]
Status of Conservation Dependent and Extinct are not MNES under the EPBC Act. Number is the current name ID.			
Scientific Name	Threatened Category	Presence Text	Buffer Status
BIRD			
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area	In feature area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Grantiella picta Painted Honeyeater [470]	Vulnerable	Species or species habitat may occur within area	In feature area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat likely to occur within area	In feature area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area	In feature area
MAMMAL			
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area	In feature area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
REPTILE			
Acanthophis hawkei			
Plains Death Adder [83821]	Vulnerable	Species or species habitat likely to occur within area	In feature area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Migratory Terrestrial Species			
Motacilla cinerea			
Grey Wagtail [642]		Species or species habitat may occur within area	In feature area
Motacilla flava			
Yellow Wagtail [644]		Species or species habitat may occur within area	In feature area
Migratory Wetlands Species			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area	In feature area
Calidris melanotos			
Pectoral Sandpiper [858]		Species or species habitat may occur within area	In feature area
Charadrius veredus			
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area	In feature area
Gallinago hardwickii			
Latham's Snipe, Japanese Snipe [863]		Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Glareola maldivarum			
Oriental Pratincole [840]		Species or species habitat may occur within area	In feature area

Other Matters Protected by the EPBC Act

Listed Marine Species			[Resource Information]
Scientific Name	Threatened Category	Presence Text	Buffer Status
Bird			
Actitis hypoleucos			
Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
Apus pacificus			
Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area	In feature area
Bubulcus ibis as Ardea ibis			
Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area	In feature area
Calidris acuminata			
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area	In feature area
Calidris ferruginea			
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area	In feature area
Calidris melanotos			
Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Chalcites osculans as Chrysococcyx osculans			
Black-eared Cuckoo [83425]		Species or species habitat may occur within area overfly marine area	In feature area
Charadrius veredus			
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area	In feature area
Gallinago hardwickii			
Latham's Snipe, Japanese Snipe [863]		Species or species habitat may occur within area overfly marine area	In feature area
Glareola maldivarum			
Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area	In feature area
Haliaeetus leucogaster			
White-bellied Sea-Eagle [943]		Species or species habitat may occur within area	In feature area
Merops ornatus			
Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area	In feature area
Motacilla cinerea			
Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area	In feature area
Motacilla flava			
Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area	In feature area
Rostratula australis as Rostratula benghalensis (sensu lato)			
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area	In feature area

Extra Information

EPBC Act Referrals				[Resource Information]
Title of referral	Reference	Referral Outcome	Assessment Status	Buffer Status
Controlled action				
CopperString Project	2010/5581	Controlled Action	Completed	In feature area
Not controlled action				
Improving rabbit biocontrol: releasing another strain of RHDV, sthrn two thirds of Australia	2015/7522	Not Controlled Action	Completed	In feature area

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

APPENDIX C – ENVIRONMENTAL REPORTS – MATTERS OF STATE ENVIRONMENTAL SIGNIFICANCE

Queensland Government

Department of Environment and Science

Environmental Reports

Matters of State Environmental Significance

For the selected area of interest
ml: 7094

Environmental Reports - General Information

The Environmental Reports portal provides for the assessment of selected matters of interest relevant to a user specified location, or area of interest (AOI). All area and derivative figures are relevant to the extent of matters of interest contained within the AOI unless otherwise stated. Please note, if a user selects an AOI via the "central coordinates" option, the resulting assessment area encompasses an area extending for a 2km radius from the point of interest.

All area and area derived figures included in this report have been calculated via reprojecting relevant spatial features to Albers equal-area conic projection (central meridian = 146, datum Geocentric Datum of Australia 1994). As a result, area figures may differ slightly if calculated for the same features using a different co-ordinate system.

Figures in tables may be affected by rounding.

The matters of interest reported on in this document are based upon available state mapped datasets. Where the report indicates that a matter of interest is not present within the AOI (e.g. where area related calculations are equal to zero, or no values are listed), this may be due either to the fact that state mapping has not been undertaken for the AOI, that state mapping is incomplete for the AOI, or that no values have been identified within the site.

The information presented in this report should be considered as a guide only and field survey may be required to validate values on the ground.

Please direct queries about these reports to: Planning.Support@des.qld.gov.au

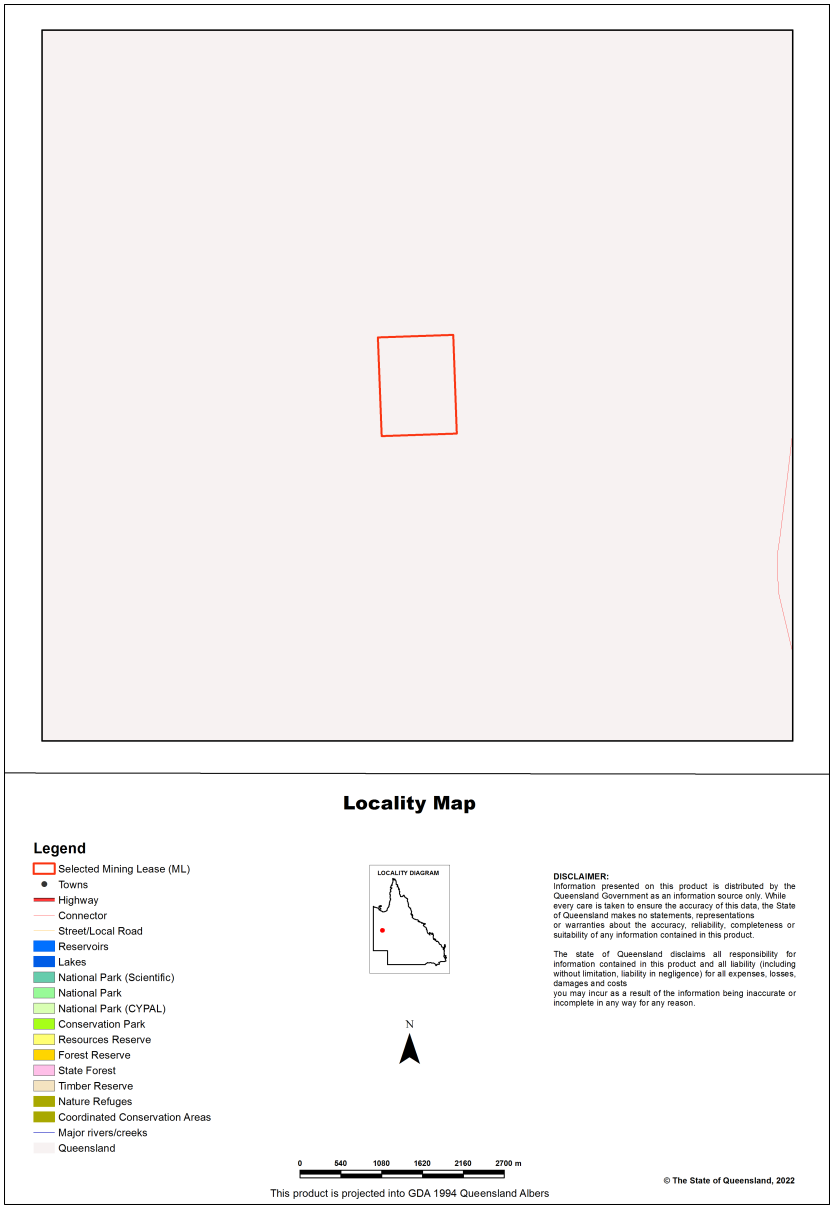
Assessment Area Details

The following table provides an overview of the area of interest (AOI) with respect to selected topographic and environmental values.

Table 1: Summary table, details for AOI ml: 7094

Size (ha)	129.99
Local Government(s)	Cloncurry Shire
Bioregion(s)	Mitchell Grass Downs, Northwest Highlands
Subregion(s)	Southwestern Downs, Mount Isa Inlier
Catchment(s)	Georgina



Matters of State Environmental Significance (MSES)

MSES Categories

Queensland's State Planning Policy (SPP) includes a biodiversity State interest that states:

'The sustainable, long-term conservation of biodiversity is supported. Significant impacts on matters of national or state environmental significance are avoided, or where this cannot be reasonably achieved; impacts are minimised and residual impacts offset.'

The MSES mapping product is a guide to assist planning and development assessment decision-making. Its primary purpose is to support implementation of the SPP biodiversity policy. While it supports the SPP, the mapping does not replace the regulatory mapping or environmental values specifically called up under other laws or regulations. Similarly, the SPP biodiversity policy does not override or replace specific requirements of other Acts or regulations.

The SPP defines matters of state environmental significance as:

- Protected areas (including all classes of protected area except coordinated conservation areas) under the *Nature Conservation Act 1992* ;

- Marine parks and land within a 'marine national park', 'conservation park', 'scientific research', 'preservation' or 'buffer' zone under the *Marine Parks Act 2004* ;

- Areas within declared fish habitat areas that are management A areas or management B areas under the Fisheries Regulation 2008;

- Threatened wildlife under the *Nature Conservation Act 1992* and special least concern animals under the Nature Conservation (Wildlife) Regulation 2006;

- Regulated vegetation under the *Vegetation Management Act 1999* that is:

  • Category B areas on the regulated vegetation management map, that are 'endangered' or 'of concern' regional ecosystems;

  • Category C areas on the regulated vegetation management map that are 'endangered' or 'of concern' regional ecosystems;

  • Category R areas on the regulated vegetation management map;

  • Regional ecosystems that intersect with watercourses identified on the vegetation management watercourse and drainage feature map;

  • Regional ecosystems that intersect with wetlands identified on the vegetation management wetlands map;

- Strategic Environmental Areas under the *Regional Planning Interests Act 2014* ;

- Wetlands in a wetland protection area of wetlands of high ecological significance shown on the Map of Queensland Wetland Environmental Values under the Environment Protection Regulation 2019;

- Wetlands and watercourses in high ecological value waters defined in the Environmental Protection (Water) Policy 2009, schedule 2;

- Legally secured offset areas.

MSES Values Present

The MSES values that are present in the area of interest are summarised in the table below:

Table 2: Summary of MSES present within the AOI

1a Protected Areas- estates	0.0 ha	0.0 %
1b Protected Areas- nature refuges	0.0 ha	0.0 %
1c Protected Areas- special wildlife reserves	0.0 ha	0.0 %
2 State Marine Parks- highly protected zones	0.0 ha	0.0 %
3 Fish habitat areas (A and B areas)	0.0 ha	0.0 %
4 Strategic Environmental Areas (SEA)	0.0 ha	0.0 %
5 High Ecological Significance wetlands on the map of Referable Wetlands	0.0 ha	0.0 %
6a High Ecological Value (HEV) wetlands	0.0 ha	0.0 %
6b High Ecological Value (HEV) waterways **	0.0 km	Not applicable
7a Threatened (endangered or vulnerable) wildlife	79.53 ha	61.2%
7b Special least concern animals	129.99 ha	100.0%
7c i Koala habitat area - core (SEQ)	0.0 ha	0.0 %
7c ii Koala habitat area - locally refined (SEQ)	0.0 ha	0.0 %
8a Regulated Vegetation - Endangered/Of concern in Category B (remnant)	0.0 ha	0.0 %
8b Regulated Vegetation - Endangered/Of concern in Category C (regrowth)	0.0 ha	0.0 %
8c Regulated Vegetation - Category R (GBR riverine regrowth)	0.0 ha	0.0 %
8d Regulated Vegetation - Essential habitat	26.36 ha	20.3%
8e Regulated Vegetation - intersecting a watercourse **	3.8 km	Not applicable
8f Regulated Vegetation - within 100m of a Vegetation Management Wetland	0.0 ha	0.0 %
9a Legally secured offset areas- offset register areas	0.0 ha	0.0 %
9b Legally secured offset areas- vegetation offsets through a Property Map of Assessable Vegetation	0.0 ha	0.0 %

Additional Information with Respect to MSES Values Present

MSES - State Conservation Areas

1a. Protected Areas - estates

(no results)

1b. Protected Areas - nature refuges

(no results)

1c. Protected Areas - special wildlife reserves

(no results)

2. State Marine Parks - highly protected zones

(no results)

3. Fish habitat areas (A and B areas)

(no results)

Refer to **Map 1 - MSES - State Conservation Areas** for an overview of the relevant MSES.

MSES - Wetlands and Waterways

4. Strategic Environmental Areas (SEA)

(no results)

5. High Ecological Significance wetlands on the Map of Queensland Wetland Environmental Values

(no results)

6a. Wetlands in High Ecological Value (HEV) waters

(no results)

6b. Waterways in High Ecological Value (HEV) waters

(no results)

Refer to **Map 2 - MSES - Wetlands and Waterways** for an overview of the relevant MSES.

MSES - Species

7a. Threatened (endangered or vulnerable) wildlife

Values are present

7b. Special least concern animals

Values are present

7c i. Koala habitat area - core (SEQ)

Not applicable

7c ii. Koala habitat area - locally refined (SEQ)

Not applicable

Threatened (endangered or vulnerable) wildlife habitat suitability models

Species	Common name	NCA status	Presence
Boronia keysii		V	None
Calyptorhynchus lathami	Glossy black cockatoo	V	None
Casuarius casuarius johnsonii	Sthn population cassowary	E	None
Crinia tinnula	Wallum froglet	V	None
Denisonia maculata	Ornamental snake	V	None
Litoria freycineti	Wallum rocketfrog	V	None
Litoria olongburensis	Wallum sedgefrog	V	None
Melaleuca irbyana		E	None
Petaurus gracilis	Mahogany Glider	E	None
Petrogale persephone	Proserpine rock-wallaby	E	None
Phascolarctos cinereus	Koala - outside SEQ*	V	None
Pezoporus wallicus wallicus	Eastern ground parrot	V	None
Taudactylus pleione	Kroombit tinkerfrog	E	None
Xeromys myoides	Water Mouse	V	None

**For koala model, this includes areas outside SEQ. Check 7c SEQ koala habitat for presence/absence.*

Threatened (endangered or vulnerable) wildlife species records

Scientific name	Common name	NCA status	EPBC status	Migratory status
Petrogale purpureicollis	purple-necked rock-wallaby	V		
Acanthophis hawkei	plains death adder	V	V	

Special least concern animal species records

Scientific name	Common name	Migratory status
Tachyglossus aculeatus	short-beaked echidna	

**Nature Conservation Act 1992 (NCA) Status- Endangered (E), Vulnerable (V) or Special Least Concern Animal (SL). Environment Protection and Biodiversity Conservation Act 1999 (EPBC) status: Critically Endangered (CE) Endangered (E), Vulnerable (V)*

Migratory status (M) - China and Australia Migratory Bird Agreement (C), Japan and Australia Migratory Bird Agreement (J), Republic of Korea and Australia Migratory Bird Agreement (R), Bonn Migratory Convention (B), Eastern Flyway (E)

To request a species list for an area, or search for a species profile, access Wildlife Online at:
https://www.qld.gov.au/environment/plants-animals/species-list/

Refer to **Map 3a - MSES - Species - Threatened (endangered or vulnerable) wildlife and special least concern animals** and **Map 3b - MSES - Species - Koala habitat area (SEQ)** for an overview of the relevant MSES.

MSES - Regulated Vegetation

For further information relating to regional ecosystems in general, go to:
https://www.qld.gov.au/environment/plants-animals/plants/ecosystems/
For a more detailed description of a particular regional ecosystem, access the regional ecosystem search page at:
https://environment.ehp.qld.gov.au/regional-ecosystems/

8a. Regulated Vegetation - Endangered/Of concern in Category B (remnant)

Not applicable

8b. Regulated Vegetation - Endangered/Of concern in Category C (regrowth)

Not applicable

8c. Regulated Vegetation - Category R (GBR riverine regrowth)

Not applicable

8d. Regulated Vegetation - Essential habitat

Values are present

8e. Regulated Vegetation - intersecting a watercourse**

A vegetation management watercourse is mapped as present

8f. Regulated Vegetation - within 100m of a Vegetation Management wetland

Not applicable

Refer to **Map 4 - MSES - Regulated Vegetation** for an overview of the relevant MSES.

MSES - Offsets

9a. Legally secured offset areas - offset register areas

(no results)

9b. Legally secured offset areas - vegetation offsets through a Property Map of Assessable Vegetation

(no results)

Refer to **Map 5 - MSES - Offset Areas** for an overview of the relevant MSES.

While every care is taken to ensure the accuracy of this product, the Department of Environment and Science acting on behalf of the State of Queensland makes no representations or warranties about its accuracy, reliability, completeness or suitability for any particular purpose and disclaims all responsibility and all liability (including without limitation, liability in negligence) for all expenses, losses, damages (including indirect or consequential damage) and costs which you might incur as a result of the data being inaccurate or incomplete in any way and for any reason. Due to varying sources of data, spatial locations may not coincide when overlaid.

The represented layers for SEQ 'koala habitat area-core' and 'koala habitat area- locally refined' in MSES are sourced directly from the regulatory mapping under the Nature Conservation (Koala) Conservation Plan 2017. Whilst every effort is made to ensure the information remains current, there may be delays between updating versions. Please refer to the original mapping for the most recent version. See https://environment.des.qld.gov.au/wildlife/animals/living-with/koalas/mapping

The koala habitat mapping within South East Queensland uses regional ecosystem linework compiled at a scale varying from 1:25,000 to 1:100,000. Linework should be used as a guide only. The positional accuracy of regional ecosystem data mapped at a scale of 1:100,000 is +/- 100 metres.

Appendices

Appendix 1 - Matters of State Environmental Significance (MSES) methodology

MSES mapping is a regional-scale representation of the definition for MSES under the State Planning Policy (SPP). The compiled MSES mapping product is a guide to assist planning and development assessment decision-making. Its primary purpose is to support implementation of the SPP biodiversity policy. While it supports the SPP, the mapping does not replace the regulatory mapping or environmental values specifically called up under other laws or regulations. Similarly, the SPP biodiversity policy does not override or replace specific requirements of other Acts or regulations.

The Queensland Government's "Method for mapping - matters of state environmental significance for use in land use planning and development assessment" can be downloaded from:

http://www.ehp.qld.gov.au/land/natural-resource/method-mapping-mses.html .

Appendix 2 - Source Data

The datasets listed below are available on request from:

http://qldspatial.information.qld.gov.au/catalogue/custom/index.page

- Matters of State environmental significance

Note: MSES mapping is not based on new or unique data. The primary mapping product draws data from a number of underlying environment databases and geo-referenced information sources. MSES mapping is a versioned product that is updated generally on a twice-yearly basis to incorporate the changes to underlying data sources. Several components of MSES mapping made for the current version may differ from the current underlying data sources. To ensure accuracy, or proper representation of MSES values, it is strongly recommended that users refer to the underlying data sources and review the current definition of MSES in the State Planning Policy, before applying the MSES mapping.

Individual MSES layers can be attributed to the following source data available at QSpatial:

MSES layers	**current QSpatial data (http://qspatial.information.qld.gov.au)**
Protected Areas-Estates, Nature Refuges, Special Wildlife Reserves	- Protected areas of Queensland - Nature Refuges - Queensland - Special Wildlife Reserves- Queensland
Marine Park-Highly Protected Zones	Moreton Bay marine park zoning 2008
Fish Habitat Areas	Queensland fish habitat areas
Strategic Environmental Areas-designated	Regional Planning Interests Act - Strategic Environmental Areas
HES wetlands	Map of Queensland Wetland Environmental Values
Wetlands in HEV waters	HEV waters: - EPP Water intent for waters Source Wetlands: - Queensland Wetland Mapping (Current version 5) Source Watercourses: - Vegetation management watercourse and drainage feature map (1:100000 and 1:250000)
Wildlife habitat (threatened and special least concern)	-WildNet database species records - habitat suitability models (various) - SEQ koala habitat areas under the Koala Conservation Plan 2019
VMA regulated regional ecosystems	Vegetation management regional ecosystem and remnant map
VMA Essential Habitat	Vegetation management - essential habitat map
VMA Wetlands	Vegetation management wetlands map
Legally secured offsets	Vegetation Management Act property maps of assessable vegetation. For offset register data-contact DES
Regulated Vegetation Map	Vegetation management - regulated vegetation management map

Environmental Reports - General Information

The Environmental Reports portal provides for the assessment of selected matters of interest relevant to a user specified location, or Area of Interest (AOI). All area and derivative figures are relevant to the extent of matters of interest contained within the AOI unless otherwise stated. Please note, if a user selects an AOI via the "Central co-ordinates" option, the resulting assessment area encompasses an area extending from 2km radius from the point of interest.

All area and area derived figures included in this report have been calculated via reprojecting relevant spatial features to Albers equal-area conic projection (central meridian = 146, datum Geocentric Datum of Australia 1994). As a result, area figures may differ slightly if calculated for the same features using a different co-ordinate system.

Figures in tables may be affected by rounding.

The matters of interest reported on in this document are based upon available state mapped datasets. Where the report indicates that a matter of interest is not present within the AOI (e.g. where area related calculations are equal to zero, or no values are listed), this may be due either to the fact that state mapping has not been undertaken for the AOI, that state mapping is incomplete for the AOI, or that no values have been identified within the site.

The information presented in this report should be considered as a guide only and field survey may be required to validate values on the ground.

Please direct queries about these reports to: biodiversity.planning@des.qld.gov.au

Disclaimer

Whilst every care is taken to ensure the accuracy of the information provided in this report, the Queensland Government makes no representations or warranties about its accuracy, reliability, completeness, or suitability, for any particular purpose and disclaims all responsibility and all liability (including without limitation, liability in negligence) for all expenses, losses, damages (including indirect or consequential damage) and costs which the user may incur as a consequence of the information being inaccurate or incomplete in any way and for any reason.

Summary Information

Tables 1 to 8 provide an overview of the AOI with respect to selected topographic and environmental values.

Table 1: Area of interest details: ml: 7094

Size (ha)	129.99
Local Government(s)	Cloncurry Shire
Bioregion(s)	Mitchell Grass Downs, Northwest Highlands
Subregion(s)	Southwestern Downs, Mount Isa Inlier
Catchment(s)	Georgina

The following table identifies available Biodiversity Planning Assessments (BPAs) and Aquatic Conservation Assessments (ACAs) with respect to the AOI.

Table 2: Available Biodiversity Planning and Aquatic Conservation Assessments

Assessment Type	Assessment Area and Version
Biodiversity Planning Assessment(s)	Mitchell Grass Downs v1.1, Northwest Highlands v1.1
Aquatic Conservation Assessment(s) (riverine)	Lake Eyre and Bulloo Basins v1.1
Aquatic Conservation Assessment(s) (non-riverine)	Lake Eyre and Bulloo Basins v1.1

Table 3: Remnant regional ecosystems within the AOI as per the Qld Herbarium's 'biodiversity status'

Biodiversity Status	Area (Ha)	% of AOI
Endangered	0.0	0.0
Of concern	0.0	0.0
No concern at present	129.99	100.0

The following table identifies the extent and proportion of the user specified area of interest (AOI) which is mapped as being of "State", "Regional" or "Local" significance via application of the Queensland Department of Environment and Science's *Biodiversity Assessment and Mapping Methodology* (BAMM).

Table 4: Summary table, biodiversity significance

Biodiversity significance	Area (Ha)	% of AOI
State Habitat for EVNT taxa	0.0	0.0
State	0.0	0.0
Regional	129.99	100.0
Local or Other Values	0.0	0.0

Table 5: Non-riverine wetlands intersecting the AOI

Non-riverine wetland types intersecting the area of interest	#
(No Records)	

NB. The figures presented in the table above are derived from the relevant non-riverine Aquatic Conservation Assessment(s). Later releases of wetland mapping produced via the Queensland Wetland Mapping Program may provide more recent

information in regards to wetland extent.

Table 6: Named waterways intersecting the AOI

(no results)

Refer to **Map 1** for general locality information.

The following two tables identify the extent and proportion of the user specified AOI which is mapped as being of "Very High", "High", "Medium", "Low", or "Very Low" aquatic conservation value for riverine and non-riverine wetlands via application of the Queensland Department of Environment and Science's *Aquatic Biodiversity Assessment and Mapping Method* (AquaBAMM).

Table 7: Summary table, aquatic conservation significance (riverine)

Aquatic conservation significance (riverine wetlands)	Area (Ha)	% of AOI
Very High	0.0	0.0
High	0.0	0.0
Medium	0.0	0.0
Low	129.99	100.0
Very Low	0.0	0.0

Table 8: Summary table, aquatic conservation significance (non-riverine)

Aquatic conservation significance (non-riverine wetlands)	Area (Ha)	% of AOI
(No Records)		

Biodiversity Planning Assessments

Introduction

The Department of Environment and Science (DES) attributes biodiversity significance on a bioregional scale through a Biodiversity Planning Assessment (BPA). A BPA involves the integration of ecological criteria using the *Biodiversity assessment and Mapping Methodology* (BAMM) and is developed in two stages: 1) **diagnostic criteria**, and 2) **expert panel criteria**. The diagnostic criteria are based on existing data which is reliable and uniformly available across a bioregion, while the expert panel criteria allows for the refinement of the mapped information from the diagnostic output by incorporating local knowledge and expert opinion.

The BAMM methodology has application for identifying areas with various levels of significance solely for biodiversity reasons. These include threatened ecosystems or taxa, large tracts of habitat in good condition, ecosystem diversity, landscape context and connection, and buffers to wetlands or other types of habitat important for the maintenance of biodiversity or ecological processes. While natural resource values such as dryland salinity, soil erosion potential or land capability are not dealt with explicitly, they are included to some extent within the biodiversity status of regional ecosystems recognised by the DES.

Biodiversity Planning Assessments (BPAs) assign three levels of overall biodiversity significance.

- **State significance** - areas assessed as being significant for biodiversity at the bioregional or state scales. They also include areas assessed by other studies/processes as being significant at national or international scales. In addition, areas flagged as being of State significance due to the presence of endangered, vulnerable and/or near threatened taxa, are identified as "State Habitat for EVNT taxa".
- **Regional significance** - areas assessed as being significant for biodiversity at the subregional scale. These areas have lower significance for biodiversity than areas assessed as being of State significance.
- **Local significance and/or other values** - areas assessed as not being significant for biodiversity at state or regional scales. Local values are of significance at the local government scale.

For further information on released BPAs and a copy of the underlying methodology, go to:

http://www.qld.gov.au/environment/plants-animals/biodiversity/planning/

The GIS results can be downloaded from the Queensland Spatial Catalogue at:

http://qspatial.information.qld.gov.au/geoportal/

The following table identifies the extent and proportion of the user specified AOI which is mapped as being of "State", "Regional" or "Local" significance via application of the BAMM.

Table 9: Summary table, biodiversity significance

Biodiversity significance	Area (Ha)	% of AOI
State Habitat for EVNT taxa	0.0	0.0
State	0.0	0.0
Regional	129.99	100.0
Local or Other Values	0.0	0.0

Refer to **Map 2** for further information.

Diagnostic Criteria

Diagnostic criteria are based on existing data which is reliable and uniformly available across a bioregion. These criteria are diagnostic in that they are used to filter the available data and provide a "first-cut" or initial determination of biodiversity significance. This initial assessment is then combined through a second group of other essential criteria.

A description of the individual diagnostic criteria is provided in the following sections.

Criteria A. Habitat for EVNT taxa: Classifies areas according to their significance based on the presence of endangered, vulnerable and/or rare (EVNT) taxa. EVNT taxa are those scheduled under the *Nature Conservation Act 1992* and/or the

Environment Protection and Biodiversity Conservation Act 1999. It excludes highly mobile fauna taxa which are instead considered in Criterion H and brings together information on EVNT taxa using buffering of recorded sites or habitat suitability models (HSM) where available.

Criteria B. Ecosystem value: Classifies on the basis of biodiversity status of regional ecosystems, their extent in protected areas (presence of poorly conserved regional ecosystems), the presence of significant wetlands; and areas of national importance such as the presence of Threatened Ecological Communities, World Heritage areas and Ramsar sites. Ecosystem value is applied at a bioregional (**B1**) and regional (**B2**) scale.

Criteria C. Tract size: Measures the relative size of tracts of vegetation in the landscape. The size of any tract is a major indicator of ecological significance, and is also strongly correlated with the long-term viability of biodiversity values. Larger tracts are less susceptible to ecological edge effects and are more likely to sustain viable populations of native flora and fauna than smaller tracts.

Criteria D. Relative size of regional ecosystems: Classifies the relative size of each regional ecosystem unit within its bioregion (**D1**) and its subregion (**D2**). Remnant units are compared with all other occurrences with the same regional ecosystem. Large examples of a regional ecosystem are more significant than smaller examples of the same regional ecosystem because they are more representative of the biodiversity values particular to the regional ecosystem, are more resilient to the effects of disturbance, and constitute a significant proportion of the total area of the regional ecosystem.

Criteria F. Ecosystem diversity: Is an indicator of the number of regional ecosystems occurring within an area. An area with high ecosystem diversity will have many regional ecosystems and ecotones relative to other areas within the bioregion.

Criteria G. Context and connection: Represents the extent to which a remnant unit incorporates, borders or buffers areas such as significant wetlands, endangered ecosystems; and the degree to which it is connected to other vegetation.

A summary of the biodiversity status based upon the diagnostic criteria is provided in the following table.

Table 10: Summary of biodiversity significance based upon diagnostic criteria with respect to the AOI

Biodiversity significance	Description	Area (Ha)	% of AOI
Regional	Remnant contains at least 1 RE with <10 pc extent remaining or rare in subregion (B2)	7.6	5.85
Regional	Remnant contains at least 1 Vulnerable or Near Threatened species (A)	20.34	15.65
Local or Other Values	Refer to diagnostic data for additional information	102.05	78.51

Assessment of diagnostic criteria with respect to the AOI

The following table reflects an assessment of the individual diagnostic criteria noted above in regards to the AOI.

Table 11: Assessment of individual diagnostic criteria with respect to the AOI

Diagnostic Criteria	Very High Rating - Area (Ha)	Very High Rating - % of AOI	High Rating - Area (Ha)	High Rating - % of AOI	Medium Rating - Area (Ha)	Medium Rating - % of AOI	Low Rating - Area (Ha)	Low Rating - % of AOI
A: Habitat for EVNT Taxa			20.34	15.6	109.64	84.3		
B1: Ecosystem Value (Bioregion)					129.98	100.0		
B2: Ecosystem Value (Subregion)	7.6	5.8			122.38	94.1		
C: Tract Size			129.98	100.0				
D1: Relative RE Size (Bioregion)					22.78	17.5	107.2	82.5
D2: Relative RE Size (Subregion)					22.78	17.5	107.2	82.5
F: Ecosystem Diversity	129.98	100.0						
G: Context and Connection	129.98	100.0						

Other Essential Criteria

Other essential criteria (also known as expert panel criteria) are based on non-uniform information sources and which may rely more upon expert opinion than on quantitative data. These criteria are used to provide a "second-cut" determination of biodiversity significance, which is then combined with the diagnostic criteria for an overall assessment of relative biodiversity significance. A summary of the biodiversity status based upon the other essential criteria is provided in the following table.

Table 12: Summary of biodiversity significance based upon other essential criteria with respect to the AOI

Biodiversity significance	Description	Area (Ha)	% of AOI
Regional	Remnant contains Core Habitat for Priority Taxa (H)	129.99	100.0

A description of each of the other essential criteria and associated assessment in regards to the AOI is provided in the following sections.

Criteria H. Essential and general habitat for priority taxa: Priority taxa are those which are at risk or of management concern, taxa of scientific interest as relictual (ancient or primitive), endemic taxa or locally significant populations (such as a flying fox camp or heronry), highly specialised taxa whose habitat requirements are complex and distributions are not well correlated with any particular regional ecosystem, taxa important for maintaining genetic diversity (such as complex spatial patterns of genetic variation, geographic range limits, highly disjunct populations), taxa critical for management or monitoring of biodiversity (functionally important or ecological indicators), or economic and culturally important taxa.

Criteria I. Special biodiversity values: areas with special biodiversity values are important because they contain multiple taxa in a unique ecological and often highly biodiverse environment. Areas with special biodiversity values can include the following:

- Ia - centres of endemism - areas where concentrations of taxa are endemic to a bioregion or subregion are found.
- Ib - wildlife refugia (Morton *et al*. 1995), for example, islands, mound springs, caves, wetlands, gorges, mountain ranges and topographic isolates, ecological refuges, refuges from exotic animals, and refuges from clearing. The latter may include large areas that are not suitable for clearing because of land suitability/capability.
- Ic - areas with concentrations of disjunct populations.
- Id - areas with concentrations of taxa at the limits of their geographic ranges.
- Ie - areas with high species richness.
- If - areas with concentrations of relictual populations (ancient and primitive taxa).
- Ig - areas containing REs with distinct variation in species composition associated with geomorphology and other environmental variables.
- Ih - an artificial waterbody or managed/manipulated wetland considered by the panel/s to be of ecological significance.
- Ii - areas with a high density of hollow-bearing trees that provide habitat for animals.
- Ij - breeding or roosting sites used by a significant number of individuals.
- Ik - climate change refuge.

The following table identifies the value and extent area of the Other Essential Criteria H and I within the AOI.

Table 13: Relative importance of expert panel criteria (H and I) used to access overall biodiversity significance with respect to the AOI

Expert Panel	Very High Rating - Area (Ha)	Very High Rating - % of AOI	High Rating - Area (Ha)	High Rating - % of AOI	Medium Rating - Area (Ha)	Medium Rating - % of AOI	Low Rating - Area (Ha)	Low Rating - % of AOI
H: Core Habitat Priority Taxa			129.98	100.0				
Ia: Centres of Endemism								
Ib: Wildlife Refugia								
Ic: Disjunct Populations								
Id: Limits of Geographic Ranges								
Ie: High Species Richness								
If: Relictual Populations								

Expert Panel	Very High Rating - Area (Ha)	Very High Rating - % of AOI	High Rating - Area (Ha)	High Rating - % of AOI	Medium Rating - Area (Ha)	Medium Rating - % of AOI	Low Rating - Area (Ha)	Low Rating - % of AOI
Ig: Variation in Species Composition								
Ih: Artificial Wetland								
Ii: Hollow Bearing Trees								
Ij: Breeding or Roosting Site								
Ik: Climate Refugia								

NB. Whilst biodiversity values associated with Criteria I may be present within the site (refer to tables 12 and 15), for the New England Tableland and Central Queensland Coast BPAs, area and % area figures associated with Criteria Ia through to Ij cannot be listed in the table above (due to slight variations in data formats between BPAs).

Criteria J. Corridors: areas identified under this criterion qualify either because they are existing vegetated corridors important for contiguity, or cleared areas that could serve this purpose if revegetated. Some examples of corridors include riparian habitats, transport corridors and "stepping stones".

Bioregional and subregional conservation corridors have been identified in the more developed bioregions of Queensland through the BPAs, using an intensive process involving expert panels. Map 3 displays the location of corridors as identified under the Statewide Corridor network. The Statewide Corridor network incorporates BPA derived corridors and for bioregions where no BPA has been assessed yet, corridors derived under other planning processes. *Note: as a result of updating and developing a statewide network, the alignment of corridors may differ slightly in some instances when compared to those used in individual BPAs.*

The functions of these corridors are:

- **Terrestrial** Bioregional corridors, in conjunction with large tracts of remnant vegetation, maintain ecological and evolutionary processes at a landscape scale, by:

  • Maintaining long term evolutionary/genetic processes that allow the natural change in distributions of species and connectivity between populations of species over long periods of time;

  • Maintaining landscape/ecosystems processes associated with geological, altitudinal and climatic gradients, to allow for ecological responses to climate change;

  • Maintaining large scale seasonal/migratory species processes and movement of fauna;

  • Maximising connectivity between large tracts/patches of remnant vegetation;

  • Identifying key areas for rehabilitation and offsets; and

- **Riparian** Bioregional Corridors also maintain and encourage connectivity of riparian and associated ecosystems.

The location of the corridors is determined by the following principles:

- Terrestrial

  • Complement riparian landscape corridors (i.e. minimise overlap and maximise connectivity);

  • Follow major watershed/catchment and/or coastal boundaries;

  • Incorporate major altitudinal/geological/climatic gradients;

  • Include and maximise connectivity between large tracts/patches of remnant vegetation;

  • Include and maximise connectivity between remnant vegetation in good condition; and

- Riparian

  • Located on the major river or creek systems within the bioregion in question.

The total extent of remnant vegetation triggered as being of "State", "Regional" or "Local" significance due to the presence of an overlying BPA derived terrestrial or riparian corridor within the AOI, is provided in the following table. For further information on how remnant vegetation is triggered due to the presence of an overlying BPA derived corridor, refer to the relevant landscape BPA expert panel report(s).

Table 14: Extent of triggered remnant vegetation due to the presence of BPA derived corridors with respect to the AOI

Biodiversity Significance	Area (Ha)	% of AOI
State	0.0	0.0
Regional	0.0	0.0
Local	0.0	0.0

NB: area figures associated with the extent of corridor triggered remnant vegetation are only available for those bioregions where a BPA has been undertaken.

Refer to **Map 3** for further information.

Threatening process/condition (Criteria K) - areas identified by experts under this criterion may be used to amend (upgrade or downgrade) biodiversity significance arising from the "first-cut" analysis. The condition of remnant vegetation is affected by threatening processes such as weeds, ferals, grazing and burning regime, selective timber harvesting/removal, salinity, soil erosion, and climate change.

Assessment of Criteria K with respect to the AOI is not currently included in the "Biodiversity and Conservation Values" report, as it has not been applied to the majority of Queensland due to data/information limitations and availability.

Special Area Decisions

Expert panel derived "Special Area Decisions" are used to assign values to Other Essential Criteria. The specific decisions which relate to the AOI in question are listed in the table below.

Table 15: Expert panel decisions for assigning levels of biodiversity significance with respect to the AOI

(No Records)

Aquatic Conservation Assessments

Introduction

The Aquatic Biodiversity Assessment and Mapping Method or AquaBAMM (Clayton *et al.* 2006), was developed to assess conservation values of wetlands in queensland, and may also have application in broader geographical contexts. It is a comprehensive method that uses available data, including data resulting from expert opinion, to identify relative wetland conservation/ecological values within a specified study area (usually a catchment). The product of applying this method is an Aquatic Conservation Assessment (ACA) for the study area.

An ACA using AquaBAMM is non-social, non-economic and identifies the conservation/ecological values of wetlands at a user-defined scale. It provides a robust and objective conservation assessment using criteria, indicators and measures that are founded upon a large body of national and international literature. The criteria, each of which may have variable numbers of indicators and measures, are naturalness (aquatic), naturalness (catchment), diversity and richness, threatened species and ecosystems, priority species and ecosystems, special features, connectivity and representativeness. An ACA using AquaBAMM is a powerful decision support tool that is easily updated and simply interrogated through a geographic information system (GIS).

Where they have been conducted, ACAs can provide a source of baseline wetland conservation/ecological information to support natural resource management and planning processes. They are useful as an independent product or as an important foundation upon which a variety of additional environmental and socio-economic elements can be added and considered (i.e. an early input to broader 'triple-bottom-line' decision-making processes). An ACA can have application in:

- determining priorities for protection, regulation or rehabilitation of wetlands and other aquatic ecosystems
- on-ground investment in wetlands and other aquatic ecosystems
- contributing to impact assessment of large-scale development (e.g. dams)
- water resource and strategic regional planning prcesses

For a detailed explanation of the methodology please refer to the summary and expert panel reports relevant to the ACA utilised in this assessment. These reports can be accessed at Wetland *Info*:

http://wetlandinfo.des.qld.gov.au/wetlands/assessment/assessment-methods/aca

The GIS results can be downloaded from the Queensland Spatial Catalogue at:

http://qspatial.information.qld.gov.au/geoportal/

Explanation of Criteria

Under the AquaBAMM, eight criteria are assessed to derive an overall conservation value. Similar to the Biodiversity Assessment and Mapping Methodology, the criteria may be primarily diagnostic (quantitative) or primarily expert opinion (qualitative) in nature. The following sections provide a brief description of each of the 8 criteria.

Criteria 1. Naturalness - Aquatic: This attribute reflects the extent to which a wetland's (riverine, non-riverine, estuarine) aquatic state of naturalness is affected through relevant influencing indicators which include: presence of exotic flora and fauna; presence of aquatic communities; degree of habitat modification and degree of hydrological modification.

Criteria 2. Naturalness - Catchment: The naturalness of the terrestrial systems of a catchment can have an influence on many wetland characteristics including: natural ecological processes e.g. nutrient cycling, riparian vegetation, water chemistry, and flow. The indicators utilised to assess this criterion include: presence of exotic flora and/or fauna; riparian, catchment and flow modification.

Criteria 3. Naturalness - Diversity and Richness: This criterion is common to many ecological assessment methods and can include both physical and biological features. It includes such indicators as species richness, riparian ecosystem richness and geomorphological diversity.

Criteria 4. Threatened Species and Ecosystems: This criterion evaluates ecological rarity characteristics of a wetland. This includes both species rarity and rarity of communities / assemblages. The communities and assemblages are best represented by regional ecosystems. Species rarity is determined by NCA and EPBC status with Endangered, Vulnerable or Near-threatened species being included in the evaluation. Ecosystem rarity is determined by regional ecosystem biodiversity status i.e. Endangered, Of Concern, or Not of Concern.

Criteria 5. Priority Species and Ecosystems: Priority flora and fauna species lists are expert panel derived. These are aquatic, semi-aquatic and riparian species which exhibit at least 1 particular trait in order to be eligible for consideration. For

flora species the traits included:

- It forms significant macrophyte beds (in shallow or deep water).
- It is an important food source.
- It is important/critical habitat.
- It is implicated in spawning or reproduction for other fauna and/or flora species.
- It is at its distributional limit or is a disjunct population.
- It provides stream bank or bed stabilisation or has soil binding properties.
- It is a small population and subject to threatening processes.

Fauna species are included if they meet at least one of the following traits:

- It is endemic to the study area (>75 per cent of its distribution is in the study area/catchment).
- It has experienced, or is suspected of experiencing, a serious population decline.
- It has experienced a significant reduction in its distribution and has a naturally restricted distribution in the study area/catchment.
- It is currently a small population and threatened by loss of habitat.
- It is a significant disjunct population.
- It is a migratory species (other than birds).
- A significant proportion of the breeding population (>one per cent for waterbirds, >75 per cent other species) occurs in the waterbody (see Ramsar criterion 6 for waterbirds).
- Limit of species range.

See the individual expert panel reports for the priority species traits specific to an ACA.

Criteria 6. Special Features: Special features are areas identified by flora, fauna and ecology expert panels which exhibit characteristics beyond those identified in other criteria and which the expert panels consider to be of the highest ecological importance. Special feature traits can relate to, but are not solely restricted to geomorphic features, unique ecological processes, presence of unique or distinct habitat, presence of unique or special hydrological regimes e.g. spring-fed streams. Special features are rated on a 1 - 4 scale (4 being the highest).

Criteria 7. Connectivity: This criterion is based on the concept that appropriately connected aquatic ecosystems are healthy and resilient, with maximum potential biodiversity and delivery of ecosystem services.

Criteria 8. Representativeness: This criterion applies primarily to non-riverine assessments, evaluates the rarity and uniqueness of a wetland type in relation to specific geographic areas. Rarity is determined by the degree of wetland protection within "protected Areas" estate or within an area subject to the *Fisheries Act 1994*, *Coastal Protection and Management Act 1995*, or *Marine Parks Act 2004*. Wetland uniqueness evaluates the relative abundance and size of a wetland or wetland management group within geographic areas such as catchment and subcatchment.

Riverine Wetlands

Riverine wetlands are all wetlands and deepwater habitats within a channel. The channels are naturally or artificially created, periodically or continuously contain moving water, or connecting two bodies of standing water. AquaBAMM, when applied to riverine wetlands uses a discrete spatial unit termed subsections. A subsection can be considered as an area which encompasses discrete homogeneous stream sections in terms of their natural attributes (i.e. physical, chemical, biological and utilitarian values) and natural resources. Thus in an ACA, an aquatic conservation significance score is calculated for each subsection and applies to all streams within a subsection, rather than individual streams as such.

Please note, the area figures provided in Tables 16 and 17, are derived using the extent of riverine subsections within the AOI. Refer to **Map 5** for further information. A summary of the conservation significance of riverine wetlands within the AOI is provided in the following table.

Table 16: Overall level/s of riverine aquatic conservation significance

Aquatic conservation significance (riverine wetlands)	Area (Ha)	% of AOI
Very High	0.0	0.0

Aquatic conservation significance (riverine wetlands)	Area (Ha)	% of AOI
High	0.0	0.0
Medium	0.0	0.0
Low	129.99	100.0
Very Low	0.0	0.0

The individual aquatic conservation criteria ratings for riverine wetlands within the AOI are listed below.

Table 17: Level/s of riverine aquatic conservation significance based on selected criteria

Criteria	Very High Rating - Area (Ha)	Very High Rating - % of AOI	High Rating - Area (Ha)	High Rating - % of AOI	Medium Rating - Area (Ha)	Medium Rating - % of AOI	Low Rating - Area (Ha)	Low Rating - % of AOI
1. Naturalness aquatic			129.99	100.0				
2. Naturalness catchment	129.99	100.0						
3. Diversity and richness					129.99	100.0		
4. Threatened species and ecosystems					129.99	100.0		
5. Priority species and ecosystems								
6. Special features								
7. Connectivity							129.99	100.0
8. Representative-ness								

The table below lists and describes the relevant expert panel decisions used to assign conservation significance values to riverine wetlands within the AOI.

Table 18: Expert panel decisions for assigning overall levels of riverine aquatic conservation significance

Decision number	Special feature	Catchment	Criteria/Indicator/Measure	Conservation rating (1-4)
(No Records)				

4 is the highest rating/value

Expert panel decision descriptions:

(No Records)

Non-riverine Wetlands

Non-riverine wetlands include both lacustrine and palustrine wetlands, however, do not currently incorporate estuarine, marine or subterranean wetland types. A summary of the conservation significance of non-riverine wetlands within the AOI is provided in the following table. Refer to **Map 6** for further information.

Table 19: Overall level/s of non-riverine aquatic conservation significance

Aquatic conservation significance (non-riverine wetlands)	Area (Ha)	% of AOI

Threatened and Priority Species

Introduction

This chapter contains a list of threatened and priority flora and/or fauna species that have been recorded on, or within 4km of the Assessment Area.

The information presented in this chapter with respect to species presence is derived from compiled databases developed primarily for the purpose of BPAs and ACAs. Data is collated from a number of sources and is updated periodically.

It is important to note that the list of species provided in this report, may differ when compared to other reports generated from other sources such as the State government's WildNet, Herbrecs or the federal government's EPBC database for a number of reasons.

Records for threatened and priority species are filtered and checked based on a number of rules including:

- Taxonomic nomenclature - current scientific names and status,
- Location - cross-check co-ordinates with location description,
- Taxon by location - requires good knowledge of the taxon and history of the record,
- Duplicate records - identify and remove,
- Expert panels - check records and provide new records,
- Flora cultivated records excluded,
- Use precise records less than or equal to 2000m,
- Use recent records greater than or equal to 1975 animals, greater than or equal to 1950 plants.

Threatened Species

Threatened species are those species classified as "Endangered" or "Vulnerable" under the *Environment Protection and Biodiversity Conservation Act 1999* or "Endangered", "Vulnerable" or "Near threatened" under the *Nature Conservation Act 1992*.

The following threatened species have been recorded on, or within approximately 4km of the AOI.

Table 22: Threatened species recorded on, or within 4km of the AOI

Species	Common name	NCA status	EPBC status	Back on Track rank	Migratory species*	Wetland species**	Identified flora/fauna
Acanthophis hawkei	plains death adder	V	V	Data deficient			FA
Petrogale purpureicollis	purple-necked rock-wallaby	V		Low			FA

NB. Please note that the threatened species listed in this section are based upon the most recently compiled DES internal state-wide threatened species dataset. This dataset may contain additional records that were not originally available for inclusion in the relevant individual BPAs and ACAs.

**JAMBA - Japan-Australia Migratory Bird Agreement; CAMBA - China-Australia Migratory Bird Agreement; ROKAMBA - Republic of Korea-Australia Migratory Bird Agreement; CMS - Convention on the Conservation of Migratory Species*.

***I - wetland indicator species; D - wetland dependent species*.

BPA Priority Species

A list of BPA priority species that have been recorded on, or within approximately 4km of the AOI is contained in the following table.

Table 23: Priority species recorded on, or within 4km of the AOI

Species	Common name	Back on Track rank	Identified flora/fauna
Amytornis ballarae	Kalkadoon grasswren	H	FA

Species	Common name	Back on Track rank	Identified flora/fauna
Barnardius zonarius macgillivrayi	Cloncurry parrot	L	FA
Egernia hosmeri	Hosmer's skink	DD	FA
Gehyra robusta	robust dtella	L	FA
Oedura bella	Gulf marbled velvet gecko	None	FA
Planigale ingrami	long-tailed planigale	L	FA
Planigale tenuirostris	Narrow-nosed Planigale	L	FA
Planigale tenuirostris	narrow-nosed planigale	L	FA
Sminthopsis macroura	Stripe-faced Dunnart	L	FA

NB. Please note that the list of priority species is based on those species identified in the BPAs, however records for these species may be more recent than the originals used. furthermore, the BPA priority species databases are updated from time to time. At each update, the taxonomic details for all species are amended as necessary to reflect current taxonomic name and/or status changes.

ACA Priority Species

A list of ACA priority species used in riverine and non-riverine ACAs that have been recorded on, or within approximately 4km of the AOI are contained in the following tables.

Table 24: Priority species recorded on, or within 4 km of the AOI - riverine

(no results)

Table 25: Priority species recorded on, or within 4 km of the AOI - non-riverine

(no results)

NB. Please note that the priority species records used in the above two tables are comprised of those adopted for the released individual ACAs. The ACA riverine and non-riverine priority species databases are updated from time to time to reflect new release of ACAs. At each update, the taxonomic details for all ACAs records are amended as necessary to reflect current taxonomic name and/or status changes.

Environmental Reports - General Information

The Environmental Reports portal provides for the assessment of selected matters of interest relevant to a user specified location, or area of interest (AOI). All area and derivative figures are relevant to the extent of matters of interest contained within the AOI unless otherwise stated. Please note, if a user selects an AOI via the "central coordinates" option, the resulting assessment area encompasses an area extending for a 2km radius from the input coordinates.

All area and area derived figures included in this report have been calculated via reprojecting relevant spatial features to Albers equal-area conic projection (central meridian = 146, datum Geocentric Datum of Australia 1994). As a result, area figures may differ slightly if calculated for the same features using a different co-ordinate system.

Figures in tables may be affected by rounding.

The matters of interest reported on in this document are based upon available state mapped datasets. Where the report indicates that a matter of interest is not present within the AOI (e.g. where area related calculations are equal to zero, or no values are listed), this may be due either to the fact that state mapping has not been undertaken for the AOI, that state mapping is incomplete for the AOI, or that no matters of interest have been identified within the site.

The information presented in this report should be considered as a guide only and field survey may be required to validate values on the ground.

Important Note to User

Information presented in this report is based upon the Queensland Herbarium's Regional Ecosystem framework. The Biodiversity Status has been used to depict the extent of "Endangered", "Of Concern" and "No Concern at Present" regional ecosystems in all cases, rather than the classes used for the purposes of the *Vegetation Management Act 1999* (VMA). Mapping and figures presented in this document reflect the Queensland Herbarium's Remnant and Pre-clearing Regional Ecosystem Datasets, and not the certified mapping used for the purpose of the VMA.

For matters relevant to vegetation management under the VMA, please refer to the Department of Resources website

https://www.dnrme.qld.gov.au/

Please direct queries about these reports to: Queensland.Herbarium@qld.gov.au

Disclaimer

Whilst every care is taken to ensure the accuracy of the information provided in this report, the Queensland Government makes no representations or warranties about its accuracy, reliability, completeness, or suitability, for any particular purpose and disclaims all responsibility and all liability (including without limitation, liability in negligence) for all expenses, losses, damages (including indirect or consequential damage) and costs which the user may incur as a consequence of the information being inaccurate or incomplete in any way and for any reason.

Summary Information

The following table provides an overview of the AOI with respect to selected topographic and environmental themes. Refer to **Map 1** for locality information.

Table 1: Area of interest details: ml: 7094

Size (ha)	129.99
Local Government(s)	Cloncurry Shire
Bioregion(s)	Mitchell Grass Downs, Northwest Highlands
Subregion(s)	Southwestern Downs, Mount Isa Inlier
Catchment(s)	Georgina

The table below summarizes the extent of remnant vegetation classed as "Endangered", "Of concern" and "No concern at present" regional ecosystems classified by Biodiversity Status within the area of interest (AOI).

Table 2: Summary table, biodiversity status of regional ecosystems within the AOI

Biodiversity Status	Area (Ha)	% of AOI
Endangered	0.0	0.0
Of concern	0.0	0.0
No concern at present	129.99	100.0
Total remnant vegetation	129.99	100.0

Refer to **Map 2** for further information.

Regional Ecosystems

1. Introduction

Regional ecosystems are vegetation communities in a bioregion that are consistently associated with particular combinations of geology, landform and soil (Sattler and Williams 1999). Descriptions of Queensland's Regional ecosystems are available online from the Regional Ecosystem Description Database (REDD). Descriptions are compiled from a broad range of information sources including vegetation, land system and geology survey and mapping and detailed vegetation site data. The regional ecosystem classification and descriptions are reviewed as new information becomes available. A number of vegetation communities may form a single regional ecosystem and are usually distinguished by differences in dominant species, frequently in the shrub or ground layers and are denoted by a letter following the regional ecosystem code (e.g. a, b, c). Vegetation communities and regional ecosystems are amalgamated into a higher level classification of broad vegetation groups (BVGs).

A published methodology for survey and mapping of regional ecosystems across Queensland (Neldner et al 2020) provides further details on regional ecosystem concepts and terminology.

This report provides information on the type, status, and extent of vegetation communities, regional ecosystems and broad vegetation groups present within a user specified area of interest. Please note, for the purpose of this report, the Biodiversity Status is used. This report has not been developed for application of the *Vegetation Management Act 1999* (VMA). Additionally, information generated in this report has been derived from the Queensland Herbarium's Regional Ecosystem Mapping, and not the regulated mapping certified for the purposes of the VMA. If your interest/matter relates to regional ecosystems and the VMA, users should refer to the Department of Resources website.

https://www.dnrme.qld.gov.au/

With respect to the Queensland Biodiversity Status,

"Endangered" regional ecosystems are described as those where:

- remnant vegetation is less than 10 per cent of its pre-clearing extent across the bioregion; or 10-30% of its pre-clearing extent remains and the remnant vegetation is less than 10,000 hectares, or
- less than 10 per cent of its pre-clearing extent remains unaffected by severe degradation and/or biodiversity loss*, or
- 10-30 per cent of its pre-clearing extent remains unaffected by severe degradation and/or biodiversity loss and the remnant vegetation is less than 10,000 hectares; or
- it is a rare** regional ecosystem subject to a threatening process.***

"Of concern" regional ecosystems are described as those where:

- the degradation criteria listed above for 'Endangered' regional ecosystems are not met and,
- remnant vegetation is 10-30 per cent of its pre-clearing extent across the bioregion; or more than 20 per cent of its pre-clearing extent remains and the remnant extent is less than 10,000 hectares, or
- 10-30 percent of its pre-clearing extent remains unaffected by moderate degradation and/or biodiversity loss.****

and "No concern at present" regional ecosystems are described as those where:

- remnant vegetation is over 30 per cent of its pre-clearing extent across the bioregion, and the remnant area is greater than 10,000 hectares, and
- the degradation criteria listed above for 'Endangered' or 'Of concern' regional ecosystems are not met.

**Severe degradation and/or biodiversity loss is defined as: floristic and/or faunal diversity is greatly reduced but unlikely to recover within the next 50 years even with the removal of threatening processes; or soil surface is severely degraded, for example, by loss of A horizon, surface expression of salinity; surface compaction, loss of organic matter or sheet erosion.*

***Rare regional ecosystem: pre-clearing extent (1000 ha); or patch size (100 ha and of limited total extent across its range).*

****Threatening processes are those that are reducing or will reduce the biodiversity and ecological integrity of a regional ecosystem. For example, clearing, weed invasion, fragmentation, inappropriate fire regime or grazing pressure, or infrastructure development.*

*****Moderate degradation and/or biodiversity loss is defined as: floristic and/or faunal diversity is greatly reduced but unlikely to recover within the next 20 years even with the removal of threatening processes; or soil surface is moderately degraded.*

2. Remnant Regional Ecosystems

The following table identifies the remnant regional ecosystems and vegetation communities mapped within the AOI and provides their short descriptions, Biodiversity Status, and remnant extent within the selected AOI. Please note, where heterogeneous vegetated patches (mixed patches of remnant vegetation mapped as containing multiple regional ecosystems) occur within the AOI, they have been split and listed as individual regional ecosystems (or vegetation communities where present) for the purposes of the table below. In such instances, associated area figures have been generated based upon the estimated proportion of each regional ecosystem (or vegetation community) predicted to be present within the larger mixed patch.

Table 3: Remnant regional ecosystems, description and status within the AOI

Regional Ecosystem	Short Description	BD Status	Area (Ha)	% of AOI
1.11.10b	Mixed low open woodland on metamorphic plains	No concern at present	33.73	25.95
1.11.2a	Eucalyptus leucophloia low open woodland	No concern at present	5.28	4.06
1.12.3b	Eucalyptus leucophylla and/or Corymbia terminalis +/- C. aparrerinja low open woodland on igneous rocks	No concern at present	5.99	4.61
1.5.3	Eucalyptus leucophloia low open woodland to woodland on sandy and gravelly red soils	No concern at present	3.84	2.96
1.5.4d	Eucalyptus leucophylla and/or Corymbia terminalis low open woodland on red earths	No concern at present	34.47	26.52
1.5.6c	Atalaya hemiglauca, Ventilago viminalis, Grevillea striata low open woodland on red earth plains	No concern at present	33.92	26.1
1.7.1a	Eucalyptus leucophloia low open woodland on silcrete and lateritic surfaces	No concern at present	4.39	3.38
4.4.1d	Astrebla pectinata +/- Aristida latifolia +/- Eulalia aurea grassland on Tertiary clays overlying limestone	No concern at present	7.6	5.85
4.9.12x4a	Corymbia terminalis low open woodland with Astrebla pectinata +/- Eulalia aurea on plains of fine grained sediments	No concern at present	0.77	0.6

Refer to **Map 2** for further information. **Map 3** also provides a visual estimate of the distribution of regional ecosystems present before clearing.

Table 4 provides further information in regards to the remnant regional ecosystems present within the AOI. Specifically, the extent of remnant vegetation remaining within the bioregion, the 1:1,000,000 broad vegetation group (BVG) classification, whether the regional ecosystem is identified as a wetland, and extent of representation in Queensland's Protected Area Estate. For a description of the vegetation communities within the AOI and classified according to the 1:1,000,000 BVG, refer to **Table 6**.

Table 4: Remnant regional ecosystems within the AOI, additional information

Regional Ecosystem	Remnant Extent	BVG (1 Million)	Wetland	Representation in protected estate
1.11.10b	Pre-clearing 170000 ha; Remnant 2019 169000 ha	19b	Not a Wetland	No representation

Regional Ecosystem	Remnant Extent	BVG (1 Million)	Wetland	Representation in protected estate
1.11.2a	Pre-clearing 1245000 ha; Remnant 2019 1239000 ha	19a	Not a Wetland	Low
1.12.3b	Pre-clearing 307000 ha; Remnant 2019 307000 ha	19b	Not a Wetland	Low
1.5.3	Pre-clearing 290000 ha; Remnant 2019 289000 ha	19a	Not a Wetland	Low
1.5.4d	Pre-clearing 356000 ha; Remnant 2019 352000 ha	19b	Not a Wetland	Low
1.5.6c	Pre-clearing 313000 ha; Remnant 2019 313000 ha	27a	Not a Wetland	Low
1.7.1a	Pre-clearing 421000 ha; Remnant 2019 420000 ha	19a	Not a Wetland	High
4.4.1d	Pre-clearing 3338000 ha; Remnant 2019 3332000 ha	30b	Not a Wetland	Medium
4.9.12x4a	Pre-clearing 235000 ha; Remnant 2019 234000 ha	19b	Not a Wetland	Low

Representation in Protected Area Estate: High greater than 10% of pre-clearing extent is represented; Medium 4 - 10% is represented; Low less than 4% is represented, No representation.

The distribution of mapped wetland systems within the area of interest is displayed in **Map 6**.

The following table lists known special values associated with a regional ecosystem type.

Table 5: Remnant regional ecosystems within the AOI, special values

Regional Ecosystem	Special Values
1.11.10b	Potential habitat for NCA listed species: Eucalyptus nudicaulis
1.11.2a	Potential habitat for NCA listed species: Eucalyptus nudicaulis, Ipomoea antonschmidii, Solanum carduiforme, Trachymene glandulosa
1.12.3b	None
1.5.3	None
1.5.4d	Potential habitat for NCA listed species: Ipomoea antonschmidii
1.5.6c	None
1.7.1a	Potential habitat for NCA listed species: Solanum carduiforme, Trachymene glandulosa
4.4.1d	None
4.9.12x4a	None

3. Remnant Regional Ecosystems by Broad Vegetation Group

BVGs are a higher-level grouping of vegetation communities. Queensland encompasses a wide variety of landscapes across temperate, wet and dry tropics and semi-arid climatic zones. BVGs provide an overview of vegetation communities across the state or a bioregion and allow comparison with other states. There are three levels of BVGs which reflect the approximate scale at which they are designed to be used: the 1:5,000,000 (national), 1:2,000,000 (state) and 1:1,000,000 (regional) scales.

A comprehensive description of BVGs is available at:

https://publications.qld.gov.au/dataset/redd/resource/

The following table provides a description of the 1:1,000,000 BVGs present and their associated extent within the AOI.

Table 6: Broad vegetation groups (1 million) within the AOI

BVG (1 Million)	Description	Area (Ha)	% of AOI
19a	Low open woodlands dominated by Eucalyptus leucophloia (snappy gum) with Triodia spp. dominated ground layer, mainly on hills and ranges. (land zones 11, 7, 5, 12, 9, 10) (NWH, GUP, MGD)	13.51	10.39
19b	Low open woodlands dominated by Eucalyptus leucophylla (Cloncurry box) or less extensively Corymbia terminalis (long-fruited bloodwood) low open woodlands and related associations, mainly lower slopes and valleys. (land zones 5, 11, 9, 7, 12, 3) (NWH, MGD, GUP, CHC)	74.96	57.67
27a	Low open woodlands dominated by a variety of species including Acacia tephrina (boree), Atalaya hemiglauca (whitewood), Ventilago viminalis (supplejack) and Lysiphyllum spp. (land zones 9, 3, 4, [5]) (MGD, GUP, BRB, NWH, DEU, [CYP, EIU])	33.92	26.1
30b	Tussock grasslands dominated by Astrebla spp. (mitchell grass) or Dichanthium spp. (bluegrass) often with Iseilema spp. on undulating downs or clay plains. (land zones 9, 3, 4, 8, [5]) (MGD, CHC, GUP, BRB, [EIU, DEU, NWH])	7.6	5.85

Refer to **Map 4** for further information. **Map 5** also provides a representation of the distribution of vegetation communities as per the 1:5,000,000 BVG believed to be present prior to European settlement.

4. Technical and BioCondition Benchmark Descriptions

Technical descriptions provide a detailed description of the full range in structure and floristic composition of regional ecosystems (e.g. 11.3.1) and their component vegetation communities (e.g. 11.3.1a, 11.3.1b). See:

http://www.qld.gov.au/environment/plants-animals/plants/ecosystems/technical-descriptions/

The descriptions are compiled using site survey data from the Queensland Herbarium's CORVEG database. Distribution maps, representative images (if available) and the pre-clearing and remnant extent (hectares) of each vegetation community derived from the regional ecosystem mapping data are included. The technical descriptions should be used in conjunction with the fields from the regional ecosystem description database (REDD) for a full description of the regional ecosystem.

Technical descriptions include data on canopy height, canopy cover and native plant species composition of the predominant layer, which are attributes relevant to assessment of the remnant status of vegetation under the *Vegetation Management Act 1999*. However, as technical descriptions reflect the full range in structure and floristic composition across the climatic, natural disturbance and geographic range of the regional ecosystem, local reference sites should be used for remnant assessment where possible (Neldner et al. 2020 (PDF)* section 3.3 of:

https://publications.qld.gov.au/dataset/redd/resource/

The technical descriptions are subject to review and are updated as additional data becomes available.

When conducting a BioCondition assessment, these technical descriptions should be used in conjunction with BioCondition benchmarks for the specific regional ecosystem, or component vegetation community.

http://www.qld.gov.au/environment/plants-animals/biodiversity/benchmarks/

Benchmarks are based on a combination of quantitative and qualitative information and should be used as a guide only. Benchmarks are specific to one regional ecosystem vegetation community, however, the natural variability in structure and floristic composition under a range of climatic and natural disturbance regimes has been considered throughout the geographic extent of the regional ecosystem. Local reference sites should be used for this spatial and temporal (seasonal and annual) variability.

Table 7: List of remnant regional ecosystems within the AOI for which technical and biocondition benchmark descriptions are available

Regional ecosystems mapped as within the AOI	Technical Descriptions	Biocondition Benchmarks
1.11.10b	Available	Not currently available

Regional ecosystem mapping over the majority of Queensland is produced at a scale of 1:100,000. At this scale, the minimum remnant polygon area is 5 hectares or minimum remnant width of 75 metres. Regional ecosystem linework reproduced at a scale greater than 1:100,000, except in designated areas, should be used as a guide only. The precision of polygon boundaries or positional accuracy of linework is 100 metres.
Regional ecosystems are defined as vegetation communities in a bioregion that are consistently associated with a particular combination of geology, landform and soil.
The polygons are labelled by regional ecosystem (RE); where more than one RE occurs, the percentage of each is labelled. The label consists of 3 components: bioregion, land zone, and vegetation community – the dominant canopy species. e.g.: RE 12.3.3. Descriptions of REs are found online. Use the search term "Regional Ecosystem Framework".
Regional ecosystem mapping at 1:100,000 map scale is derived from the following sources: 1:80,000 B&W 1960's aerial photography, Landsat TM imagery, geology, soils, land systems data, field survey and historical records.
Remnant woody vegetation is defined as vegetation that has not been cleared or vegetation that has been cleared but where the dominant canopy has >70% of the height and >50% of the cover relative to the undisturbed height and cover of that stratum and is dominated by species characteristic of the vegetation's undisturbed canopy.
Non-remnant vegetation includes regrowth and disturbed native vegetation.

This product is projected into GDA 1994 Queensland Albers

Broad Vegetation Groups (BVG) of Queensland are applied by look up table to the regional ecosystem vegetation communities. Each polygon is coloured by the dominant BVG5M and the component regional ecosystems labelled. Where more than one regional ecosystem occurs, the percentage of each is labelled.
Regional ecosystem mapping over the majority of Queensland is produced at a scale of 1:100,000. At this scale, the minimum remnant polygon area is 5 hectares or minimum remnant width of 75 metres. Regional ecosystem linework reproduced at a scale greater than 1:100,000, except in designated areas, should be used as a guide only. The precision of polygon boundaries or positional accuracy of linework is 100 metres.
Regional ecosystems are defined as vegetation communities in a bioregion that are consistently associated with a particular combination of geology, landform and soil.
The label consists of 3 components: bioregion, land zone, and vegetation community – the dominant canopy species. e.g.: RE 12.3.3. Descriptions of REs are found online. Use the search term "Regional Ecosystem Framework".
Regional ecosystem mapping at 1:100,000 map scale is derived from the following sources: 1:80,000 B&W 1960's aerial photography, Landsat TM imagery, geology, soils, land systems data, field survey and historical records.

Accuracy information: The positional accuracy of wetland data mapped at a scale of 1:100,000 is +/-100m with a minimum polygon size of 5ha or 75m wide for linear features, except for areas along the east coa st which are mapped at the 1:50,000 scale with a positional accuracy of +/-50m, with a minimum polygon size of 1ha or 35m wide for linear features. Wetlands smaller than 1ha are not delineated on the wetland data. Consideration of the effects of mapped scale is necessary when interpret ing data at a larger scale, e.g. 1:25,000. For property assessment, digital linework should be used as a guide only. The extent of wetlands depicted on this map is based on rectified 2013 Landsat ETM+ imagery supplied by Statewide Landcover and Trees Study (SLATS), Department of Environment and Science. The extent of water bodies is based on the maximum extent of inundation derived from available Landsat imagery up to and including the 2013 imagery.

APPENDIX F – FORM OF CERTIFICATION

Form of certification (Annual Dams Inspection)

Name of Registered Professional Engineer providing certification:

Allan Watson

Address of Registered Professional Engineer providing certification:

ATC Williams Pty Ltd
Ground Level, 16-20 Edmondstone Street
Newwmarket QLD 4051

Statement of relevant experience

I hereby state that I am a Registered Professional Engineer of Queensland (Number 5721) and meet the requirements of the definition of a 'suitably qualified and experienced person'.

Statement of certification

All relevant material relied upon by me is provided and/or referenced in the attached report "Tick Hill Mine – Tailings Reclamation Project – Consequence Category Assessment"; Reference 120100.02.R01-1, dated 13 June 2022.

I hereby certify that the consequence assessment "Tick Hill Mine – Tailings Reclamation Project – Consequence Category Assessment"; Reference 120100.02. R01-1, dated 13 June 2022 provides an assessment of the Tailings Storage Facility at the Tick Hill Mine in accordance with the Manual for Assessing Consequence Categories and Hydraulic Performance of Structures published as ESR/2016/1933 Version 5, 29 March 2016.

This consequence assessment has concluded that the Tailings Storage facility has a 'Significant' consequence category and is therefore considered to be a regulated structure.

I, Allan Watson, declare that the information provided as part of this certification is true to the best of my knowledge. I acknowledge that it is an offence under section 480 of the Environmental Protection Act 1994 to give the administering authority a document containing information that I know is false, misleading or incomplete in a material particular.

Signed:

Allan Watson RPEQ 5721
Date: 13 June 2022

Executive Summary

Sinclair Knight Merz (SKM) was commissioned by Xstrata Copper (Xstrata) in August 2012, to undertake a data review of the available decommissioning and rehabilitation information on the Tick Hill gold mine (THGM) and to prepare a Progressive Rehabilitation Report (PRR) and supporting Audit Statement (AS).

Due to insufficient rehabilitation investigation and documentation available to reliably inform a PRR and obtain approval by the Department of Environment and Heritage Protection (DEHP), it was agreed by Xstrata and SKM that an Interim Rehabilitation Report (IRR) and supporting AS would be produced. The IRR is intended to provide a snapshot of current rehabilitation performance achieved at the THGM and guide further or additional studies, primarily in contaminated lands, hydrogeology, hydrology and geochemistry, that will be required for progressive closure and eventual relinquishment.

The accompanying Audit Statement also provides recommendations on the further studies that will be needed to develop an understanding of the residual environmental risks of the site, as part of the process towards successful mine closure.

This document is the result of a data review in September 2012 and site visits undertaken in October 2012 and February 2013 (flora only). The main findings of the data review and field observations include:

Terrestrial Flora

- A 1999 terrestrial ecology survey report concluded that the rehabilitation sites generally supported an acceptably high level of vertebrate and invertebrate diversity, but that a greater proportion of perennial vegetation on the rehabilitation sites would help to stabilise seasonal variation in the community composition over time.
- Vegetation condition at each survey site was also assessed using DEHP's BioCondition monitoring methodology
- Site observations displayed rehabilitation sites (tailings dam, rock dump, MIA) dominated by buffel grass with fewer habitat features apart from dense ground cover patches in a mosaic with bare ground.
- Results following 2012 and 2013 surveys indicate the rehabilitation in terms of establishing a self-sustaining vegetation cover suitable for soil stabilisation and grazing has been successful.

Soils

- There are three major soil groups likely to be encountered at the THGM site. Kandosol and Dermosol units (A horizon, B horizon or AB blended horizons) are suitable for reuse in rehabilitation subject to limitations. Both soil units generally exhibit suitable fertility and generally have a low potential for erosion.
- Rudosols may be encountered in small quantities at the Tick Hill Mine are unsuitable for reuse for rehabilitation they have low overall fertility and generally have a high to very-high potential for erosion.

Geotechnical

- Site observations by the EPA and XMIM between March 2000 and March 2008 state that the tailings dam, decant pond and waste rock emplacement are stable and that scouring of the western batter of the decant pond, and northern batter of the waste rock emplacement were to be addressed. The borrow pit areas, south-west and north-east of the tailings dam (Hollingsworth, Dames & Moore, 1999), have been rehabilitated.
- 2012 site observations
    - Tailings Dam - there were no visible signs of scouring, slumping or bulging of any of the batters or the toe of the embankments. There were also no signs of sink holes or slumping on the top surface. The spillway showed no signs of erosion and the wire rock protection was intact and in good condition.

- Decant Pond and waste rock emplacement - there were no visible signs of slumping or bulging of any of the batters or the toe of the embankments. There were also no signs of sink holes or slumping on the top surface. However, scour channels did exist on both structures and it is recommended that the scour lines be remediated to prevent deterioration of the localised area in the long term.
- Borrow Pit - Stability of the borrow pits is not considered to be an issue.

Groundwater

- The spatial distribution of groundwater monitoring points is restricted to two bores: one in-between the pit and the decant pond and another to the north of the decant pond.
- The depth to groundwater at Bore 1 ranges from 24.7 m (April 1997) to 26.5 m (November 1998). The depth to groundwater at Bore 2 ranges from 30.66 m (April 1997) to 20.5 m (October 1997).
- The number of groundwater monitoring bores is insufficient to define the spatial distribution and temporal variations of groundwater levels and to collect additional data within the structural features, therefore recommendation to expand the current monitoring bore network to include at least 3 new bores.

Contaminated Land

- No information exists on the former locations of activities that had the potential to cause land contamination, and there is insufficient documentation available to assess the current contaminated land status of the site.
- A contaminated land assessment (Preliminary Site Investigation) should be undertaken as defined in the Guidance for Contaminated Land Professionals (2012).

Environmental Audit

XMIM has demonstrated conformance with 46 of the 52 conditions assessed in total. Conformance with the remainder of the conditions was not able to be reliably determined due to the information gaps that currently exist on aspects such as hydrogeology and contaminated lands.

1. Introduction

Sinclair Knight Merz (SKM) was commissioned by Xstrata Copper (Xstrata) in August 2012, to undertake a data review of the available decommissioning and rehabilitation information on the Tick Hill Gold Mine (THGM) and to prepare a Progressive Rehabilitation Report (PRR) and supporting Audit Statement (AS).

Following the data review, it was evident that significant information was not available or had not been recorded. Therefore, it was agreed between Xstrata and SKM to submit an Interim Rehabilitation Report (IRR) and supporting AS.

Due, in part to this lack of information, cost estimations for the rehabilitation of THGM have not been provided. Further studies and monitoring will be required before reasonable and accurate cost estimations can be made.

A gap analysis was undertaken and recommendations towards PRR requirements have been included here. To inform this IRR, the following tasks were undertaken by SKM between August 2012 and March 2013:

- Review of historical environmental data and reports prepared by Xstrata and other parties;
- Review of statutory approval conditions and Environmental Management Plan (EM Plan);
- Preparation of an audit framework;
- Site inspection that incorporated surveys of terrestrial flora and fauna, geotechnics and soils/landform;
- Identification of information gaps that may prevent an acceptable level of scientific certainty in relation to the state of rehabilitation achieved; and
- Preparation of an IRR and an AS.

This document provides information gathered from data and information reviews, field observations, and correspondence with Xstrata personnel in the following discipline fields:

Aspect	SKM Personnel
Project Manager	Jeremy Durbin
Terrestrial flora and fauna	Julia Olsen
Geotechnical engineering	Tony Matacin
Soils and landform	Tim Rohde
Hydrogeology	Andrew Wilson
Contaminated land	Matthew Pomeroy
Audit Statement	John Moraitis

1.1 Timing

The desktop review commenced in August 2012, with site visits conducted on 10-12 October, 2012 and 19-20 March, 2013 to provide wet and dry season terrestrial flora and fauna coverage.

1.2 Exclusions and Assumptions

The site visits were restricted to surface observations only, SKM staff specialising in groundwater and contaminated land were not required to attend. However, information from the site visits was delivered to the relevant staff for interpretation into the overall findings.

1.3 Environmental Approvals History

The THGM was officially opened in January 1992 and was originally operated by Carpentaria Gold Pty Ltd., a Mount Isa Mines (MIM) Holdings Ltd subsidiary. Active mining occurred up until 1995, at which time the mine was decommissioned.

In 1999, a Plan of Operations (PoO) was submitted and approved by the (then) Department of Mines and Energy for a period of five years. In December 1999, SKM undertook a flora and fauna survey of the site that was designed to meet the requirements of a PRR in line with the *Environmental Protection Act 1994* (EP Act). The SKM survey stated that the THGM had been successfully rehabilitated from a flora and fauna perspective. The report was submitted to the (then) Queensland Environmental Protection Agency (EPA) and it was understood by MIM at the time, that 47ha of the THGM had been successfully rehabilitated, and 3ha (final void) remained unapproved, existing as disturbed land.

In 2002, Carpentaria Gold Pty Ltd was granted an application for a conversion of a level 1 mining project to a level 2 mining project. Xstrata Copper took control of MIM in June 2003 and this ownership is referred to as XMIM throughout this document. In 2004, the mining leases were transferred from Carpentaria Gold Pty Ltd to XMIM, and a Standard Environmental Authority (EA) was issued by the (then) EPA on 27 July, 2004.

Since 2004, the THGM has been deemed to be in a 'care and maintenance phase' by the DEHP (the current administering authority). Despite the granting of the Standard EA (MIM400266004) in 2004 as a level 2 mining activity, the DEHP advised in 2012 that the THGM area (50ha in total) was not formally approved as rehabilitated land. Without this formal approval, the THGM is understood to have greater than 10 ha of disturbed land and DEHP's level of assessment criteria requires a level 1 assessment for any disturbance over 10 ha.

In 2012, XMIM submitted a revised PoO (2012-2017) and EM Plan for care, maintenance and exploration purposes only, to support a Level 1 mining project assessment. A revised EA was approved on 5 April, 2013.

XMIM determined that to facilitate potential mining lease sale or relinquishment, a level 2 mining project assessment was required. To enable an application to change the level of assessment from a level 1 to a level 2 mining project, DEHP would require a PRR and supporting AS. These documents must demonstrate that 47ha of land have been successfully rehabilitated and confirm that less than 10 ha of disturbed land awaits rehabilitation.

Following the DEHPs approval of the EM Plan and the level 1 mining project application in February 2013, XMIM will be in a better position to submit a completed PRR and supporting AS following completion of outstanding actions as outlined in this document.

This IRR document has been produced to provide guidance towards achieving successful rehabilitation outcomes that will inform a future PRR and AS at a suitable time in the future.

1.4 Environmental Audit

In parallel to the data review and site visit, an environmental audit was conducted which involved a desktop review of historical information relating to the THGM and a site inspection to ground truth the findings of the review work.

The purpose of the audit was to determine XMIMs conformance with the EA (MIM400266004) issued for the THGM in 2004, and the Code of Environmental Compliance for Mining Lease Projects (January 2001 – Version 0). SKM was able to determine that XMIM has demonstrated conformance with 46 of the 52 conditions assessed in total. Conformance with the remainder of the conditions was not able to be reliably determined due to the information gaps that currently exist on aspects such as hydrogeology and contaminated lands.

2. Context

2.1 Mine Location

The THGM is approximately 110km south-southeast of Mount Isa, located predominately within mining lease (ML)7094 and the adjoining ML7096 and ML7097. There are no major waterways located near the project area, although there are two minor ephemeral drainage lines either side of the open-cut pit drain off the lease in a northerly direction to join Petticoat Creek (**Figure 2-1**).

2.2 Mine History

XMIM has reported that active mining operations occurred from 1992 to 1995 producing 513,333 ounces of gold from 705,000 tonnes of ore at a recovered average grade of 22.6 grams/tonne gold. For the first five months of the operation, ore was transported by truck to a loading facility at a siding on the Phosphate Hill rail line, and then by rail to Mingela, north of Ravenswood. The ore was processed by Carpentaria Gold at Ravenswood. In December 1991, a processing plant utilising carbon-in-leach methods was commissioned to enable all processing to be carried out onsite. During the first quarter of 1992, underground mining operations commenced to allow complete extraction of the ore body to a final depth of 250m. Access to the underground operations was via a portal located within the open cut at a depth of 25m. The portal was sealed off in April 1995 when active mining ceased.

The Tick Hill Decommissioning Plan was used to guide mine closure in 1995, however this document could not be located following searches within Xstrata, MIM archives, DEHP, and URS (formally Hollingsworth Dames and Moore – the original authors of the Decommissioning Plan document).

2.3 Environmental Aspects – Background

2.3.1 Government Guidelines

The DEHP state the following four general rehabilitation goals for areas previously disturbed by mining. The land must be:

- safe to humans and wildlife;
- non-polluting;
- stable; and
- able to sustain an agreed post-mining land use.

In addition to these general points, DEHP may also identify site specific goals which could include requirements under other legislation. As such DEHP have provided a list of additional requirements that may include:

- establish vegetation communities that are demonstrably similar to a pre-existing ecosystem (especially where native vegetation is the proposed land use);
- establish or enhance the habitat of an endangered species (especially where the mining has affected such habitat);
- restore stream patterns where there has been a temporary stream diversion;
- achieve water quality that meets some specific beneficial use;
- maintain or restore some specific aesthetic values;
- preserve specific European and indigenous heritage that has been registered for the site (note that these values are managed under other legislation); and
- achieve specific socio-economic outcomes (e.g. restore high value agricultural land necessary to maintain a viable rural industry).

Further detail on DEHP general rehabilitation requirements for mining projects is provided in Guideline EM1122 Mining – Rehabilitation requirements for mining projects (**Appendix A**). Further to this current Guideline, there are also at least 13 additional rehabilitation guidelines, drafted in 1995 that are still referred to by DEHP (refer DEHP website: http://www.ehp.qld.gov.au/land/mining/technical_guidelines.html).

2.3.2 Terrestrial Flora Aspect

As THGM exists on current MLs, the ecological aspects are managed under the EP Act and *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act), with specific compliance conditions within the current THGM EA (MIM400266004).

In 1999, SKM undertook a terrestrial flora and fauna survey that used reference sites adjacent to the mine site to enable comparison between existing vegetation and THGM rehabilitation success. The 1999 report was used to inform the terrestrial flora and fauna habitat survey locations, including reference sites, and enable good temporal coverage – unusual for such a remote, closed mine site.

The area around and including Tick Hill is not covered by current DEHP regional ecosystem (RE) mapping, so knowledge of REs and other habitat data is not currently available.

There are no known EPBC Act threatened ecological communities or threatened flora species listed within a 10km radius from the centre of Tick Hill mine, according to the EPBC Act Protected Matters Search tool (accessed, 5 December, 2012).

2.3.3 Geotechnical Engineering Aspect

There is limited data available on the geotechnical aspects of the THGM while it was operational, however there have been several site audits undertaken by the (then) EPA in March 2000, May 2005 and March 2008. XMIM performed their own audits in August 2004 and June 2012. The observations and recommendations from those audits relating to the tailings dam, decant pond, waste rock emplacement and borrow pit are summarised in **Section 3.3.2**.

2.3.4 Soils/Landform Aspect

Although limited post-mine soil survey data was available, a data review and site visit provided adequate information to confirm land suitability assessments and strategic cropping land potential.

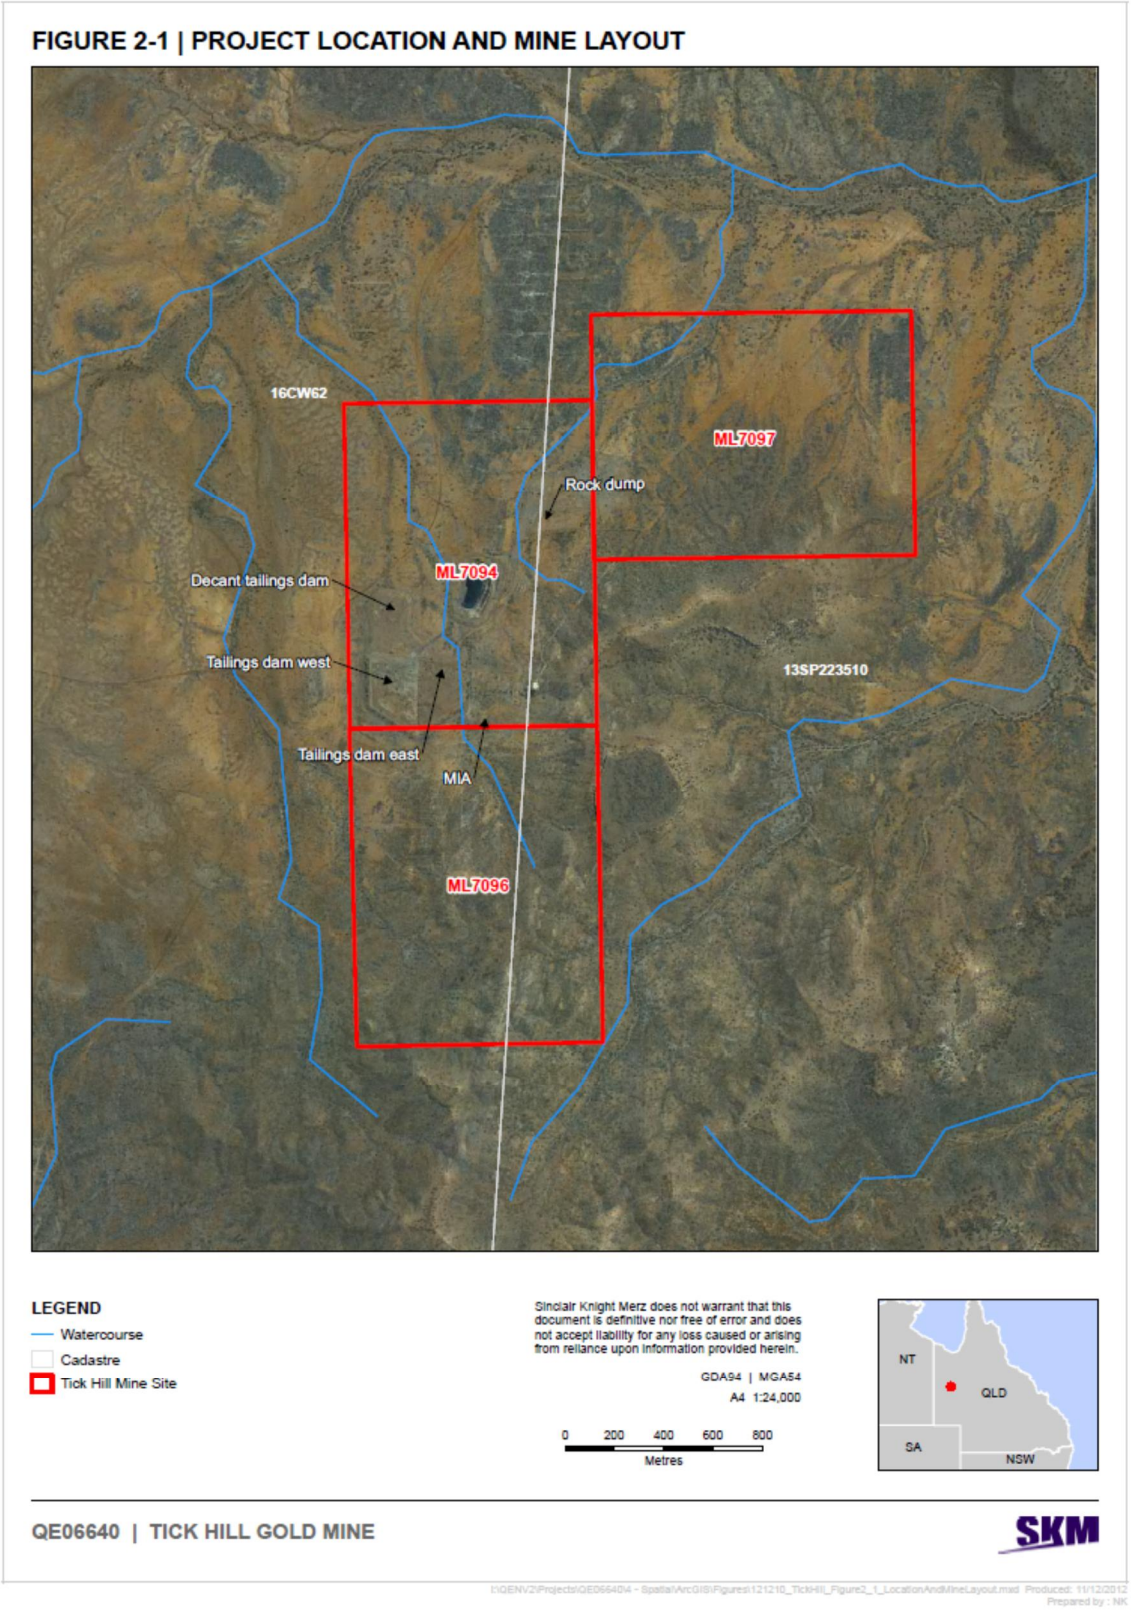

Figure 2-1: Tick Hill Mine Location

2.3.5 Groundwater Aspect

The purpose of the *Environmental Protection (Water) Policy 2009* is to achieve the object of the EP Act in relation to Queensland waters, including groundwater.

The object of EP Act is to protect Queensland's environment while allowing for development. The EP Act states that an environmental protection policy must identify the environmental values to be enhanced or protected under the policy, and that an environmental protection policy may state the water quality objectives to be achieved and maintained.

The environmental values and water quality objectives for waters must be considered when complying with a regulatory requirement under the EP Act. The environmental values also inform whether environmental harm under the EP Act has occurred.

For the THGM site, the environmental values of groundwater must be identified and the water quality objectives to be achieved and maintained must be defined, to enable the PRR to occur.

Geological reports indicate the ore body is contained within metaquartzites, laminate pegmatites and lodestone of the Proterozoic aged Corella Formation. These lithologies are likely to have low primary permeability, with secondary permeability features including joints and fractures having potential to transmit groundwater flow.

The spatial distribution of groundwater monitoring points is restricted to two bores: one in-between the pit and the tailings dam and another to the east, as shown on **Figure 2-2**. Lithological logs and bore construction details for these bores have not been provided to SKM to date, therefore the exact aquifer material, characteristics, thickness and screened intervals at the locations are not known.

A search of the Queensland Department of Natural Resources and Mines (NRM) groundwater database was performed for a 5 km radius of the Tick Hill. A total of two registered groundwater bores were identified, with their locations also shown on **Figure 2-2**. No geological or hydrogeological data are available for these bores, and no information about their status or use is available.

The closest surface water drainage is located north of the site, forming an upper tributary of the Georgina River. The Groundwater Dependant Ecosystem (GDE) Atlas (Bureau of Meteorology, 2012) has mapped this drainage as having low potential for groundwater interaction. No other potential GDE features were identified in the GDE Atlas in close proximity to the site.

The sole environmental receptor for groundwater is considered to be watering of stock through pumping from aquifer (based on current land use).

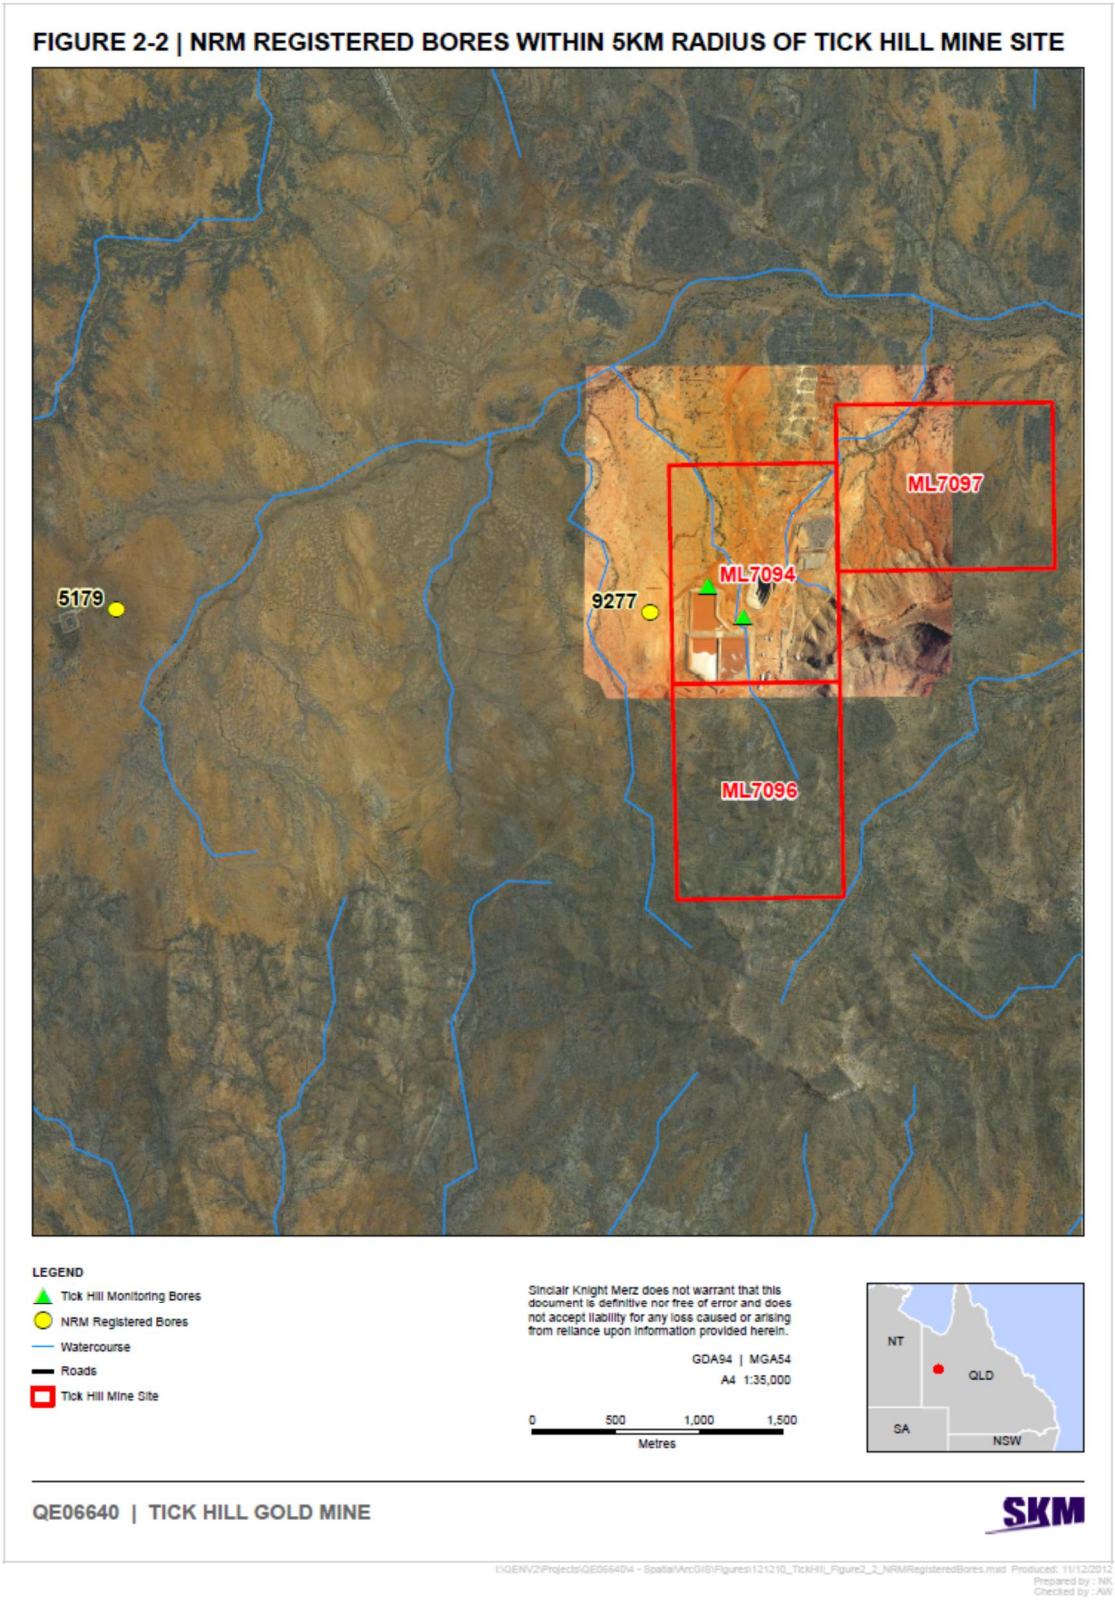

Figure 2-2: Tick Hill Monitoring Bores and NRM Registered Bores within 5km

2.3.6 Contaminated Lands Aspect

Contaminated land is managed under the EP Act. Further guidance on contaminated land matters are noted under the *Guidance for Contaminated Land Professionals (2012)*. A mine-site is considered a notifiable activity under Schedule 3 of the EP Act.

Subsequently, mine sites are listed on the DEHP Environment Management Register (EMR). Potentially contaminating activities on a mine site can include (but are not necessarily limited to) the following notifiable activities:

- Mine Wastes;
- Mineral Processing;
- Petroleum Product or Oil Storage;
- Chemical Storage;
- Workshop;
- Abrasive Blasting;
- Landfill; and
- Explosives Storage.

Additionally, secondary processes can also occur, i.e. Acid Rock Drainage (ARD) mobilisation of heavy metals and break down of complex cyanides to more available (and toxic) forms.

Contamination is considered in terms of a source of contaminants (i.e. soil contamination from past spillage, leakage from tailings dam, surface contamination), a pathway (i.e. migration of contaminants in leachate to groundwater and travel through groundwater, consumption of contaminated soils by grazing livestock) and a receptor (i.e. discharge of contaminated groundwater to surface water, extraction of groundwater for potable or domestic supply).

Contamination can often take many years to result in impacts as the contaminants migrate to a receptor via a pathway.

Note on additional Guideline: The *Greentape Reduction and Other Legislation Amendment Act (2012)* came into effect on 31 March 2013. This legislation includes further details on requirements for mine closure. Where applicable, these requirements have been discussed within this document.

3. Data Review

XMIM provided the majority of THGM data, documents and reports including previous internal and external audits, monitoring data, regulatory licences, management plans and approvals. Several documents were also provided by URS, who now represent Dames, Hollingsworth and Moore.

Tick Hill was closed 17 years ago, and following changes in mine personnel, mine ownership, and office locations, some potentially useful data has not been located, including:

- Decommissioning Plan (Hollingsworth, Dames and Moore, circa 1995);
- Continuous monitoring data for groundwater, surface water, and soil chemistry;
- Any data targeting contaminated lands;
- Terrestrial fauna data; and
- Geotechnical data.

Cognisant of the above omissions, SKM conducted this data review on all documents received, as listed in **Appendix B**.

3.1 Gap Analysis

A preliminary gap analysis, (**Appendix C**) was sent to XMIM during the data review process providing some transparency to the findings of this report in advance of this document.

The main findings of this included:

- no information exists on the former locations of activities that had the potential to cause land contamination;
- the Decommissioning Plan prepared by Hollingsworth, Dames and Moore (1993-1995) could not be located;
- there are no agreements of the remediation targets for contaminated land on record;
- there are no statutory declarations from a suitably qualified person on record for contaminated land issues;
- there is no evidence to suggest that an independent auditor was used for any contaminated land investigations;
- the number of groundwater monitoring bores is insufficient to define the spatial distribution and temporal variations of groundwater levels and to collect additional data within the structural features;
- there is no evidence to suggest that a review of sampling protocols has occurred, nor that a suitable groundwater sampling guideline such as Geoscience Australia 2009 has been followed;
- the groundwater quality data requires reviewing to establish lower and upper background limits for relevant parameters, to enable future exceedances to be identified as potential groundwater impacts;
- an absence of slug or pumping tests in bores to determine the aquifer properties hydraulic conductivity and storativity;
- a requirement to collate and synthesise all hydrogeological data to develop a conceptual hydrogeological model, enabling the interactions between the void and groundwater to be determined;
- incorporate rainfall, runoff and groundwater data to prepare a site water balance through numerical groundwater modelling, based on the conceptual model;
- assess changes to groundwater hydrochemistry through analytical modelling, based on conceptual and numerical models; and
- a lack of operational process knowledge and infrastructure location to inform future studies.

The preliminary gap analysis results, drafted following the October 2012 site visit are provided in **Appendix C**.

3.2 Terrestrial Flora

3.2.1 Vegetation mapping

The DEHP RE, high value regrowth and essential habitat mapping do not cover the project area. For areas where regional ecosystem mapping has not yet been prepared, the remnant vegetation map indicates areas of remnant and non-remnant vegetation. According to DEHP's remnant vegetation map, the project area contains remnant vegetation.

3.2.2 1999 Survey Report

The previous survey report concluded that the rehabilitation sites generally supported an acceptably high level of vertebrate and invertebrate diversity, but that a greater proportion of perennial vegetation on the rehabilitation sites would help to stabilise seasonal variation in the community composition over time.

Comparisons between the 1999 and 2012 survey results are described and discussed in **Sections 4.1.2** and **5.1**.

3.3 Geotechnical

3.3.1 Site geology

The mine lease is within the Corella Formation which is a Proterozoic sequence of thin-banded calc-silicate granofels and amphibolites. Quartz feldspar porphyries occur within the sequence as do ridge forming schistose quartzite, which may represent lenses of metamorphosed quartz arenite.

The Corella Formation sequence dips at 55° to 60° to the west and has a regional strike of 0° to 18°. The ore horizon is generally conformable with this sequence and is broadly defined as a highly strained zone within two quartzite units of variable thickness.

The unaltered rock types in the hanging wall and footwall sequences are schist and granofels with varying proportions of quartz, hornblende, biotite, plagioclase and microcline with minor magnetite and titanite. Rocks in the ore zone include similar lithologies as well as plagioclase-rich rocks.

Previous geotechnical investigations showed that the subsurface profile comprises up to 1.7 m of silty and clayey gravel residual soil overlying a weathered schist bedrock.

Mine closure compliance for the tailings dam and decant pond, waste rock dump and borrow area as per Xstrata Closure Guidelines, which conform to the DEHP Code, are shown in **Table 3-1**.

Table 3-1: Mine closure compliance criteria for various domains

Domain	Compliance Criteria
Tailings surface facilities	No erosion of batters, no batter slumping and stability issues, adequate drainage off facility, adequate freeboard, re-vegetation acceptable, no dust sourced from dam.
Waste rock piles	No erosion on slopes, acceptable water draining from slopes, re-vegetation acceptable.
Borrow pits	Re-contouring and revegetation acceptable.

In general, the tailings dam, decant pond and waste rock dump are required to have batters that are stable over the long term and will not scour. Re-vegetation is to be similar to surrounding undisturbed areas in terms of

species and density. The borrow pit areas are required to be rehabilitated to a stable landform, similar to that of the surrounding undisturbed areas.

3.3.2 Previous audits

Site audits were performed by the (then) EPA in March 2000, May 2005 and March 2008. XMIM performed their own audits in August 2004 and June 2012. The observations and recommendations from those audits relating to the tailings dam, decant pond, waste rock emplacement and borrow pit are summarised in **Table 3-2**.

Table 3-2: Previous Geotechnic Audit Results

Date	Observations	Recommendations / Actions
March 2000 (EPA)	Gully erosion present to the west of the tailings dam. Rock filled wire mattress at tailings dam spillway shows signs of some displacement. Some downstream erosion below the overflow structure (the spillway). Gully erosion on northern waste rock dump batter (towards the eastern end). Rilling on northern batter of waste rock dump. Some settling on top of waste dump and tailings dam allowing ponding (not necessarily detrimental).	Inspect surface drainage of waste structures following heavy rain.
August 2004 (XMIM)	Tailings dam, decant pond and waste rock structures appear stable. Gully erosion present on the western part of the decant pond batter. Rill erosion present on the northern part of the waste rock emplacement batter. Ground level gully erosion to the west of the tailings dam. Borrow pits have been rehabilitated. All rehabilitated areas blend well into the landscape, with similar vegetation densities within natural variation. Ground cover is dominated by buffel grass which is consistent with surrounding grazing areas.	Investigate cause of erosion to the west of tailings storage facility followed by remediation if required. Potential requirement for repair of erosion on south-western batter of decant pond. Spread seeds or plant species on tailings dam, decant pond, waste rock dump consistent with that found in surrounding areas.
May 2005 (EPA)	Rehabilitation on tailings dam and waste rock dump well established. No tailings dam, decant pond or waste rock dump stability issues noted.	None relating to tailings dam, decant pond or waste rock dump.
March 2008 (EPA)	Tailings dam was well vegetated with no visual evidence of erosion. Tailings dam spillway has been rock armoured and secured with no erosion evident. Decant pond has been capped and vegetated. Waste rock dump batters appear stable with some ground cover. Very limited amounts of erosion with no evident instability. Waste rock dump cap was vegetated and there was no evidence of oxidisation or salts on the surface. Low grade ore stockpile adjacent to the eastern side of the waste rock dump was removed in 1995 and the site	Submit PRR / Final Rehabilitation Report to have rehabilitation signed off. Will need to include Land Contamination Assessment to have the PRR signed off with a reduced Financial Assurance.

Date	Observations	Recommendations / Actions
	has been vegetated with no obvious indication of contamination or erosion.	
June 2012 (XMIM)	Rehabilitation completed.	

Site observations by the EPA and XMIM between March 2000 and March 2008 state that the tailings dam, decant pond and waste rock emplacement are stable and that scouring of the western batter of the decant pond, and northern batter of the waste rock emplacement were to be addressed. The borrow pit areas, south-west and north-east of the tailings dam (Hollingsworth, Dames & Moore, 1999), have been rehabilitated.

3.4 Soils

A soils and landform desktop review was undertaken, followed by a visual assessment of the THGM site and surrounding area. The major objectives of the visual assessment were to:

- **Objective 1. Classify and determine the soil types within the project site.** To satisfy Objective 1, the soil taxonomic classification system used was the Australia Soil Classification (ASC) system. The system is routinely used as the soil classification system in Australia.
- **Objective 2. Assess the pre-mining Land Suitability classes within the project site.** To satisfy Objective 2, the Guideline for Agricultural Land Evaluation in Queensland (DPI, 1990 and DME, 1995) was reviewed. This includes a standard list of limitations for assessing agricultural land suitability in Queensland.
- **Objective 3. Assess the pre-mining Good Quality Agricultural Land (GQAL) classes within the project site.** To satisfy Objective 3, the Planning Guidelines: Identification of Good Quality Agricultural Land (DPI/DHLGP, 1993) was used. The guideline sets conditions for land in terms of limitations, rating and ability of the land to maintain a sustainable level of agricultural productivity.
- **Objective 4. Assess the pre-mining Strategic Cropping Land (SCL)** within the project site and provide soil management recommendations for management. To satisfy Objective 4, the relevant guideline applied was the Protecting Queensland's strategic cropping land; Proposed criteria for identifying strategic cropping land (DERM, 2011)
- **Objective 5. Assess the potential erosion rates for various scenarios post-closure.**

3.4.1 Soil Classification (Objective 1)

There are three major soil groups likely to be encountered at the THGM site. Kandosol and Dermosol units (A horizon, B horizon or AB blended horizons) are suitable for reuse in rehabilitation subject to limitations. Both soil units generally exhibit suitable fertility and generally have a low potential for erosion.

Rudosols that may be encountered in small quantities at the Tick Hill Mine are unsuitable for reuse for rehabilitation as they have low overall fertility and generally have a high to very-high potential for erosion.

- The site review did identify some erosion ranging from minor to moderate. Where moderate erosion was identified it appears to have undergone self-armouring and does not show fresh signs of erosion
- Topsoil has been spread as a thin veneer across all domains is unlikely to have any potential to reduce / restrict infiltration. This may be an issue if a review of the sites geology identifies a risk of acid rock drainage.

Based on the available data gathered during the desktop assessment it can be summarised that all soil units (either undisturbed or reused as a growth medium during rehabilitation) are unlikely to have significant agricultural value (either prior to or post-mining) and are likely classified as either:

- Suitable land with moderate limitations – land which is moderately suited to a proposed use but which requires significant inputs to ensure sustainable use; or
- Marginal land with severe limitations on land use requiring major inputs to ensure sustainability. Such inputs may outweigh the returns from the land.

This assessment is based on the assumption that plant available water capacity (PAWC) will be the highest ranking limiting factor and further land suitability information is provided in **Section 3.4.2**.

- The current rehabilitated site consists of soil profiles that might have been encountered prior to mining in term of topsoil thickness and placement in the landscape.

It is unlikely that the site will have any future economic value for agricultural development (cropping) and should be relinquished as agreed with the landowner to grazing, or to natural habitat if this option exists. A review of the ASRIS database has been presented in **Figure 3-1** for THGM and the surrounding area. Available mapping indicates that the site is likely dominated by:

- Kandosol Soil (High Probability of Occurrence).
- Dermosol Soil (Medium Probability of Occurrence).
- Rudosol Soil (Medium Probability of Occurrence).

There are three major soil groups likely to be encountered at the Tick Hill Mine site. Kandosol and Dermosol units (A horizon, B horizon or AB blended horizons) are suitable for reuse in rehabilitation – subject to limitations. Both soil units generally exhibit suitable fertility and generally have a low potential for erosion.

Rudosols may be encountered in small quantities at the Tick Hill Mine are unsuitable for reuse for rehabilitation they have low overall fertility and generally have a high to very-high potential for erosion.

3.4.2 Land Suitability (Objective 2)

Land suitability mapping for the Tick Hill Mine and the surrounding area (project area) was not available at the time of preparing field notes. However a number of general comments can be made based on the soil units that are likely to be encountered at site.

The majority of the Tick Hill Mine and the surrounding area are used for broad acre cattle grazing on native grasses which were in good condition at the time of field observation.

The project area has low mean annual rainfall of between 200-400mm/year (BOM 2007) and rainfall can be unreliable and long droughts are common. Such unreliable and insufficient rainfall presents a significant limitation to sustained cropping in this area. No cropping was observed during the survey.

Land suitability classification is based on specific land uses assessed using the classes shown in **Table 4-3** (DME, 1995).

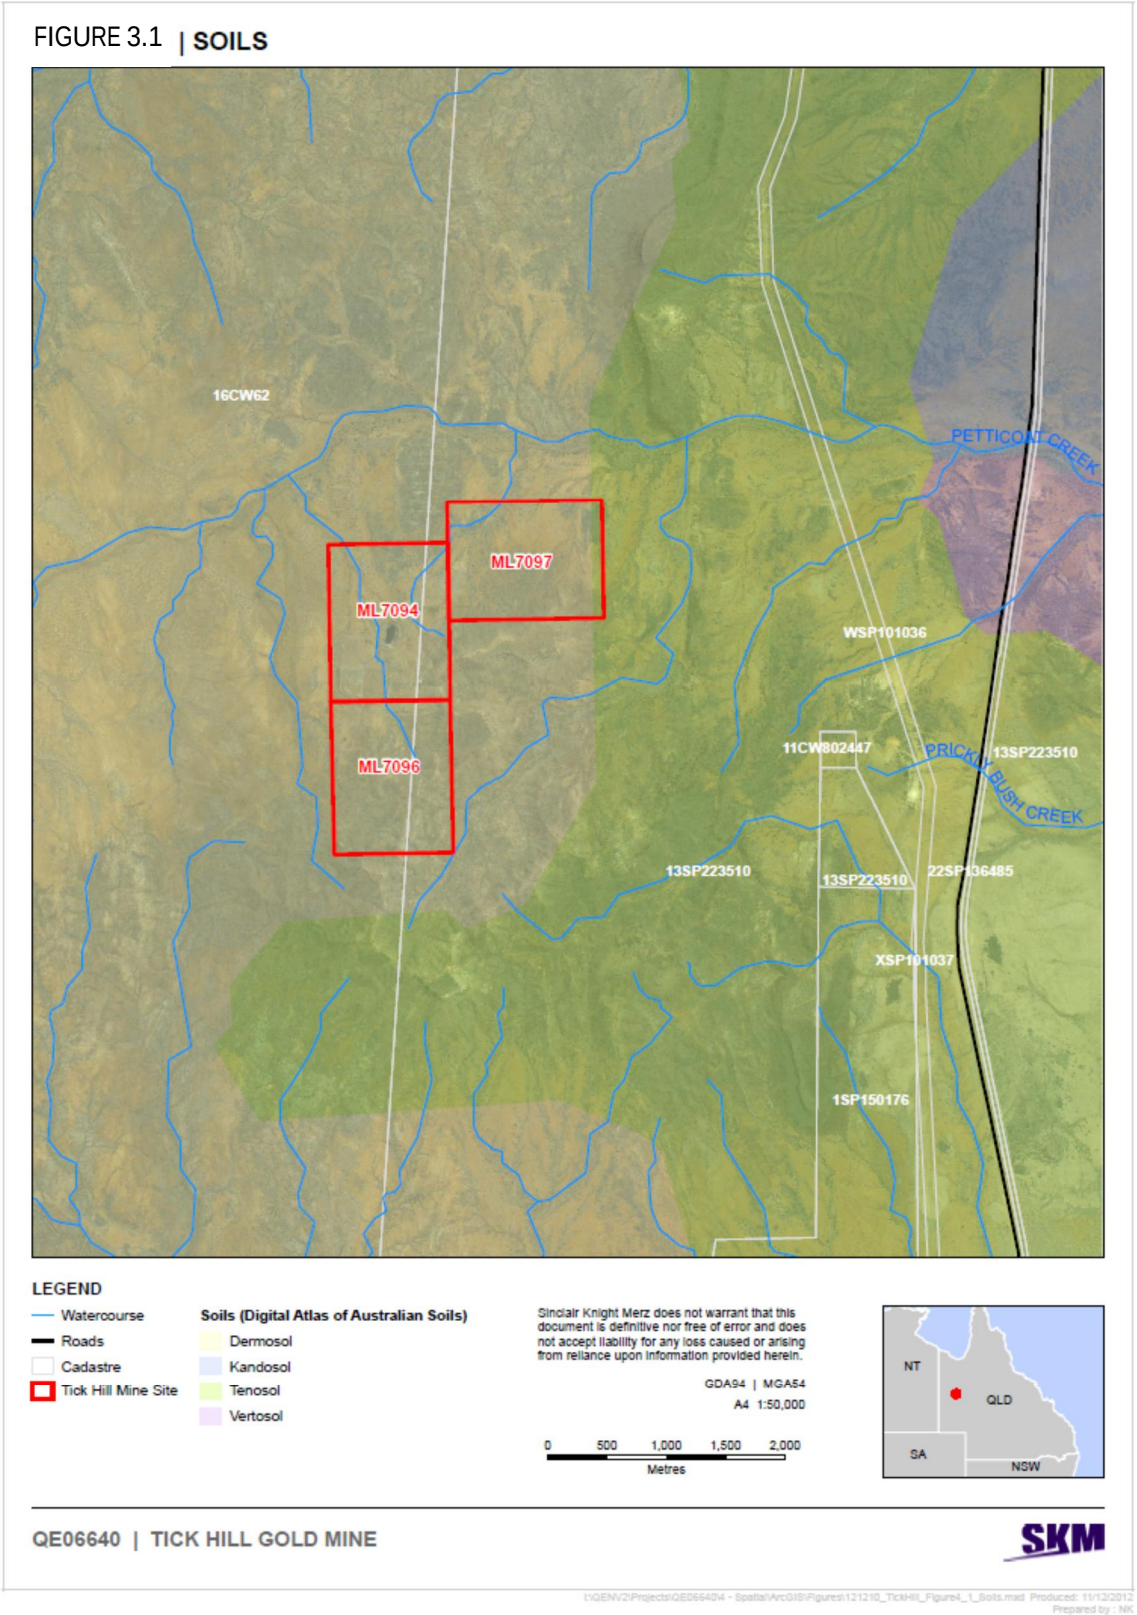

Figure 3-1: ASRIS Soil Mapping of Tick Hill and Surrounding Area

Table 3-3: Land Suitability Classes

Class	Suitability Description
Class 1	Suitable land with negligible limitations and is highly productive requiring only simple management practices.
Class 2	Suitable land with minor limitations which either reduce production or require more than simple management practices to sustain the use.
Class 3	Suitable land with moderate limitations – Land which is moderately suited to a proposed use but which requires significant inputs to ensure sustainable use.
Class 4	Marginal land with severe limitations on land use requiring major inputs to ensure sustainability. Such inputs may outweigh the returns from the land.
Class 5	Unsuitable land with extreme limitations that precludes its use.

Land suitability class is determined by the *highest ranking limiting factor* or a combination of a number of factors. The soils have been assessed against the following limiting factors defined by DME (1995) which determine crop and grazing suitability class:

- **Plant available water capacity (PAWC):** PAWC is likely the *highest ranking limiting factor* in an arid environment. Further discussion is provided below.
- **Nutrient deficiency:** This was not assessed as part of the visual assessment however a review of the ASRIS database has provided general information.
- **Salinity:** This has not been assessed in the current program.
- **Soil physical factors:** This has not been assessed in the current program.
- **Erosion:** This was not assessed as part of the visual assessment however a review of the ASRIS database has provided general information.
- **Workability:** This has not been assessed in the current program.
- **Microrelief:** This has not been assessed in the current program.
- Flooding - This has not been assessed in the current program. The site is located at the head of a catchment and the likelihood of flooding is very low.
- **Wetness:** This has not been assessed in the current program.
- **Topography:** This has not been assessed in the current program.
- **Rockiness:** This has not been assessed in the current program.

3.4.2.1 Plant Available Water Capacity (PAWC)

Plant available water capacity (PAWC) is a significant soil property in this locality as cropping is based on fallow storage of moisture in the soil profile. PAWC is the moisture stored in the soil profile that is available to the plant and is classically defined as the moisture present between field capacity and permanent wilting point (15 bar). **Table 3-4** shows the criteria which DME (1995) proposed for assessment of the moisture availability limitation for crops in this region.

Table 3-4: PAWC: Land Suitability for Cropping / Grazing (DME, 1995)

Limiting Factor	1	2	3	4	5
Moisture	PAWC >125 mm	PAWC 100-125 mm	PAWC 75-100 mm	PAWC 50-75 mm	PAWC <50 mm

Soil water storage assessment for Land Suitability Assessment was based on estimated PAWC derived from the following surrogate values (**Table 3-5**) (DERM, 2011).

Table 3-5: Estimated average PAWC per 100 mm soil depth increment for soil texture grades (DERM, 2011)

Field Texture	Estimate PAWC per 100 mm depth of soil
sand; clayey sand; loamy sand	4 mm
sandy loam	5 mm
loam; silty loam; sandy clay loam	6 mm
clay loam; clay loam, sandy; silty clay loam	8 mm
light clay; light medium clay	10 mm
medium clay; medium heavy clay; heavy clay	12 mm

PAWC suitability range estimates for observed soil orders in this survey area are shown in **Table 3-6**.

Table 3-6: Estimated Plant Rooting Depth, PAWC and Land Suitability Class

Soil Order	Concept	Estimated Effective Rooting Depth (mm)	PAWC (mm)	Limitation Level
Dermosol	Texture contrast soils with moderately to strongly structured usually clayey B2 horizons.	700->1000	100-> 125	3
Kandosol	Very deep (>1 m) and clay-rich	700 - >1000	100-> 125	3
Rudosol	Shallow apedal soil	<100 mm	>100	3-4

3.4.2.2 Land Suitability Assessment Summary

Based on the available data gathered during the desktop assessment it can be summarised that all soil units (either undisturbed or reused as a growth medium during rehabilitation) are unlikely to have significant agricultural value (either prior to or post-mining) and are likely classified as either:

- Suitable land with moderate limitations – land which is moderately suited to a proposed use but which requires significant inputs to ensure sustainable use; or
- Marginal land with severe limitations on land use requiring major inputs to ensure sustainability. Such inputs may outweigh the returns from the land.

This assessment is based on the assumption that PAWC will be the highest ranking limiting factor.

3.4.3 Good Quality Agricultural Land (GQAL) (Objective 3)

GQAL assessment is derived from the land Suitability Assessment (previous section). Based on the previous sections discussion, which is solely derived from a desk top review the Tick Hill Mine and Surrounding area are likely to be classified as either:

- **C_3 -** Land suitable for limited grazing of native pastures; or
- **D -** Land not suitable for agricultural uses due to extreme limitations. This may be undisturbed land with significant habitat, conservation and / or catchment values or land that may be unsuitable because of very steep slopes, shallow soils, rocky outcrops or poor drainage.

3.4.4 Strategic Cropping Land (SCL) (Objective 4)

Queensland SCL trigger mapping does not include the Tick Hill Mine or the surrounding area. The region, based solely on the desktop assessment, is described as arid with limited to very limited agricultural value for agriculture. The region has value for broad acre cattle grazing at very low stocking rates.

3.4.5 Erosion (Objective 5)

General erosion potential has been discussed in **Section 3.4.1**. In general Kandsol and Dermosol soil units have a lower potential for erosion, while Rudosols have a high potential for erosion.

3.5 Groundwater

The spatial distribution of groundwater monitoring points is restricted to two bores: one in-between the pit and the decant pond and another to the north of the decant pond. Monitoring of these two bores has occurred sporadically - April 1997, October 1997, November 1998, May 1999, August 2001, January 2004, July 2004, and April 2012.

The depth to groundwater at Bore 1 ranges from 24.7 m (April 1997) to 26.5 m (November 1998), indicating some seasonal variation with lower water levels recorded at the end of the dry season. The depth to groundwater at Bore 2 ranges from 30.66 m (April 1997) to 20.5 m (October 1997), which displays the opposite variation to that observed at Bore 1. Such a large variation in groundwater level at Bore 2 is considered unlikely, when compared to the smaller variation at Bore 1, and may be due to human error or inaccurate measuring equipment. No survey data for these bores has been provided to SKM to date.

The groundwater is near neutral, with the exception of a sampling round conducted in July 2004 where values pH of 13 and 12.9 were recorded at Bore 1 and Bore 2 respectively. These elevated pH values are not consistent with previous monitoring rounds and are considered anomalous and likely the result of an improperly calibrated or broken electronic meter. The groundwater is slightly brackish with EC ranging from 2400 to 5330 µS/cm at Bore 1, and 1980 to 2020 µS/cm at Bore 2. An EC value of 442 µS/cm was measured at Bore 2 in July 2004 but a corresponding reading was reported for Bore 1 at the same time, and so the reading is considered potentially anomalous.

To date, SKM has been provided with only one set of analytical results for the pit void water from a sample collected in March 2012. The pH was determined to be 8.34 and the EC was determined to be 4720 µS/cm.

For the groundwater sampling round undertaken in April 2012, the volume of groundwater purged from the bores does not tally with the pumping rate and pumping time. Xstrata have informed SKM that this discrepancy is due to the bores being pumped dry, and the samples were collected once the bores had recharged. No bore purging records have been provided to SKM to date for comparison with the previous groundwater sampling events.

For the majority of the monitoring events, groundwater samples were analysed for the following:

- major cations: Na, K, Ca Mg.
- major anions: Cl, SO 4 HCO_3.
- nutrients: NO_2 and NO_3.
- metals: Al, As, Cd, Cu, Fe, Mn, Mo, Ni, Pb, Sr, Zn, Cn.

In April 1997, samples were also analysed for the following additional metals: B, Ba, Be, Bi, Br, Ce, Co, Cr, Cs, Dy, Er, Eu, Ga, Gd, Ge, Hp. Hg. Ho, I, In, La, Li, Lu, Nb, Nd, P, Pr, Rb, Re, Sb, Sc, Se, Sm, Sn, Ta, Tb, Te, Th, Ti, Tl, Tm, U, V, W.

The groundwater sampled from Bore 1 and Bore 2 in April 2012 is Na, Mg-HCO 3, Cl type. The water sampled from the pit void in March 2012 is Na, Mg-Cl type. A Piper diagram of the major ions for these April 2012 data is presented in **Figure 3-2**. As shown, the groundwater from Bore 1 and Bore 2 plots to the lower left of the pit

void water, due to the greater proportion of HCO 3 in the groundwater. The pit void water could be affected by evaporative concentration and precipitation of some ions to change its chemical type.

It should be noted that it is difficult to assess the degree of connection between groundwater and the pit void water based on only one sample for the pit void. The degree of connection is also complicated by the absence of the following:

- water elevation data (to determine groundwater flow direction); and
- bore completion data (to determine if both of the bores are completed in the same aquifer, and if the pit is intercepting the same aquifers as either of the bores).

The DEHP recognises the Australian and New Zealand Guidelines for Fresh and Marine Water Quality 2000 (ANZECC 2000) as the appropriate guideline to assess the agricultural use environmental value. Groundwater samples collected from Bore 1 and Bore 2 are below the ANZECC 2000 guidelines for stock water for all major ions and metals sampled and analysed, where guidelines have been established for these analytes.

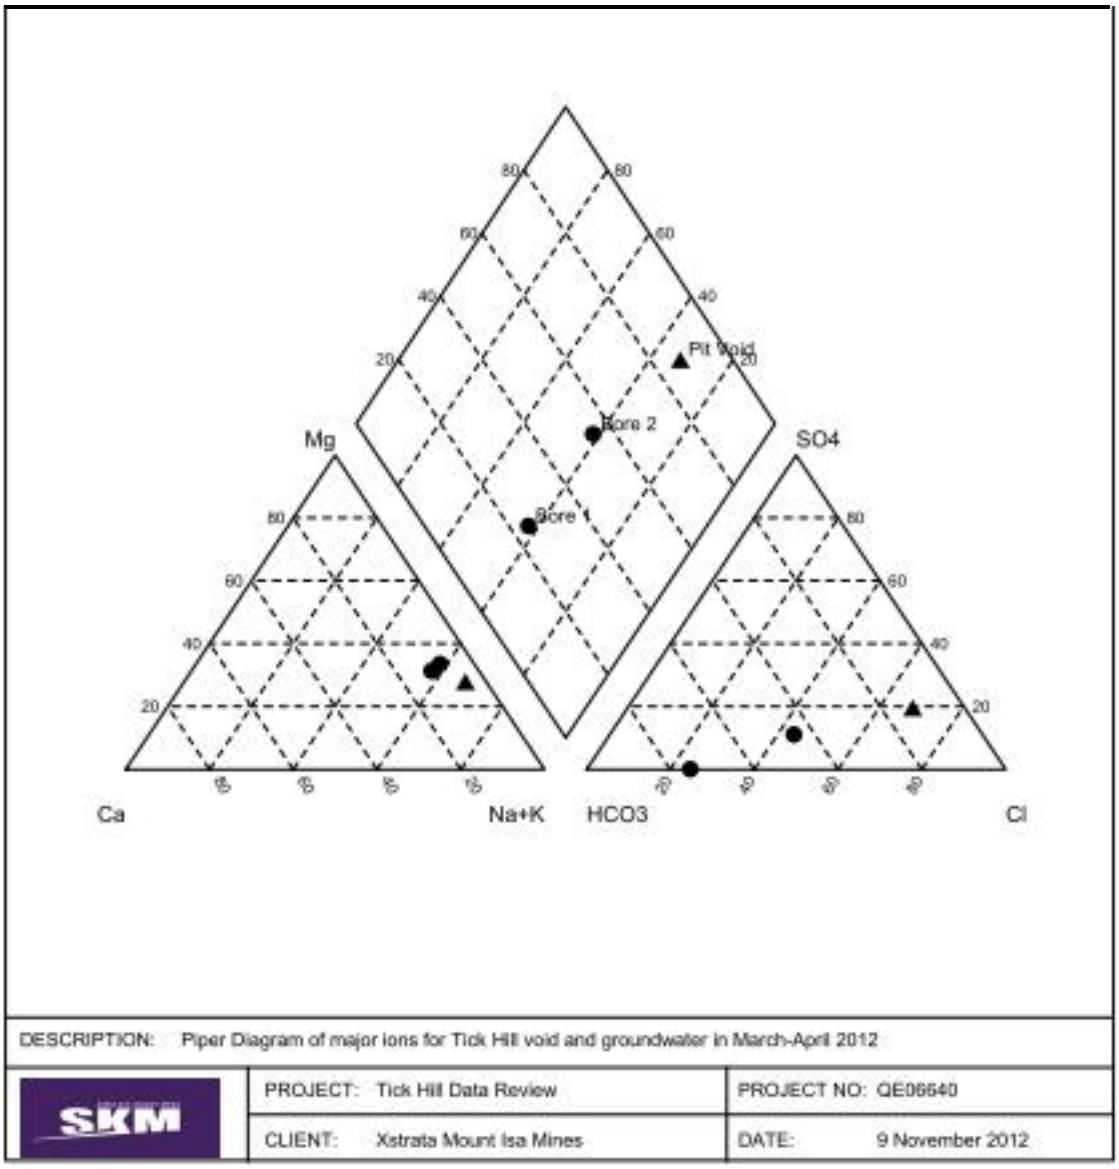

Figure 3-2: Piper Diagram of major ions for Tick Hill pit void and groundwater in March-April 2012.

3.6 Contaminated Land

Data was provided by the client to assist with this work. Although the mine site was closed prior to the introduction of the EP Act in Queensland it is considered that closure will require the current requirements and standards to be met. To assist with the review and assessment of data gaps, a checklist (**Appendix H**) was created identifying the steps required to close out a mine from a contaminated land perspective to today's standards and the respective reports expected to be required to support the closure. Approximately 20 years have passed between the decommissioning of the mine and the present. Therefore the review assessed whether documents produced relating to decommissioning of the mine prepared previously provide information which can be used to support relinquishment of the mine.

A summary of the review is as follows:

- There is insufficient documentation in regard to land contamination.
- There are no land contamination assessment reports available.
- Regulatory approval of the tailings dam capping was noted.
- Although a decommissioning report was prepared, this document is unable to be located (either by the client or the consultant).
- No rehabilitation report was available.
- No DEHP-approved management plans exist for contaminated sites not fully remediated i.e. Tailings dams.
- No statutory declaration(s) by a Suitably Qualified Person (as required under Section 381 of the EP Act) for lodgement of reports to the regulator are available.

4. Field Survey

4.1 Flora

4.1.1 Methods

The discrete point sampling method used in SKM's 1999 flora survey was replicated in this survey of the project area. The field surveys were undertaken between 10-12 October, 2012 and 19-20 March, 2013. The discrete point sampling method of measuring fractional ground cover is similar to the standardised method described in Muir et. al. (2011).

The discrete point sampling method was considered suitable as it is quantitative, time-efficient and relatively objective, ensuring repeatability between different operators (Booth et al. 2006). Three transects with 100 observations each were sampled at each of the previously surveyed sites: rock dump, tailings dam, colluvial slope (reference site) and plains (reference site) site. An additional survey site was established within the former mine infrastructure area (MIA). Ground cover (live or dead plant material, or bare ground) was recorded at one metre intervals along a 100m tape, and during the first survey (October 2012) the species frequency counted in each of ten one square metre quadrats (placed at 10m intervals along each transect). This was not replicated in the March 2013 survey as there was very little change in conditions identifiable.

Species from these quadrats were identified where sufficient plant material made identification possible.

Vegetation condition at each survey site was also assessed using DEHP's BioCondition monitoring methodology (Eyre et. al, 2011). The use of the BioCondition method was to enable comparison with DEHP's regional ecosystem (RE) benchmark documents and thus give an indication of the condition of the vegetation within the project area in relation to undisturbed vegetation.

4.1.2 Observations

4.1.2.1 Vegetation description

Vegetation within the project area consisted of a low open woodland dominated by western bloodwood (*Corymbia terminalis*) and Cloncurry box (*Eucalyptus leucophylla*), with occasional beefwood (*Grevillea striata*) and whitewood (*Atalaya hemiglauca*). On the relatively undisturbed colluvial slope (**Plate 4-1** and **Plate 4-2**) there was a shrub layer of Chisholm's wattle (*Acacia chisholmii*), sandhill wattle (*Acacia ligulata*) and native cotton (*Gossypium australe*) and ground cover was dominated by Spinifex (*Triodia* spp.). Within the rehabilitated areas (**Plate 4-3** and **Plate 4-4**) such as the tailings dams, rock dump and MIA the shrub layer was mostly absent and the ground cover was dominated by buffel grass (*Pennisetum ciliare*).

4.1.2.2 Regional ecosystems

The regional ecosystem description database (DEHP, 2012) lists remnant ecosystem (RE) descriptions and status. Vegetation observed within the project area was found to be consistent with the RE description for 1.11.3:

> "Low open-woodland of *Corymbia terminalis* usually with *Eucalyptus leucophylla* or *E. leucophloia* with *Acacia* spp. dominated shrub layer and ground layer of *Triodia* spp. and/or tussock grasses. Includes areas of *Acacia* spp. shrubland and *Triodia* spp. grassland. Occurs on metabasalts and dolerites; skeletal soils, some shallow loams."

RE 1.11.3 has a vegetation management status of 'least concern' and a biodiversity status of 'no concern at present'.

Plate 4-1: Colluvial slope October 2012

Plate 4-2: Colluvial slope March 2013

Plate 4-3: Mine infrastructure area October 2012

Plate 4-4: Mine infrastructure area March 2013

4.1.2.3 Ground cover, species richness and plant frequency data

Table 4-1: shows the averaged fractional ground cover and species richness data for the 1999 and 2012 surveys. Initial interpretation of the results indicates that the plant abundance and species richness was considerably lower in 2012 than in 1999. This may be due to a higher amount of dead plant material at the time of the 2012 flora survey. Results of the 2012 and 2013 surveys were analysed to determine if observed changes are statistically significant from 1999 results. **Appendix D** presents the averaged data for each survey location.

Due to low rainfall, site conditions during the 2012 and 2013 surveys were very similar and both were characterised by conditions typical of a dry season. As such it was not considered valid to compare the March 2013 survey data with the January 1999 (wet season) data.

A statistical comparison of August 1999 data with 2012 data was undertaken using T-tests. No significant differences were detected apart from a decrease in cover abundance at the plains (reference) location. This is not within an area disturbed by previous mining activity.

Survey locations are shown on **Figure 4-1**. Photos at each survey location and summarised field data are contained in **Appendix D**.

Table 4-1: Averaged survey results

Site		Mean plant frequency/10m^2			Mean species richness (#)			% Cover (live + dead plant material)			% Bare		
		August 1999	January 1999	October 2012	August 1999	January 1999	October 2012	August 1999	January 1999	October 2012	March 2013	August 1999	January 1999	October 2012	March 2013

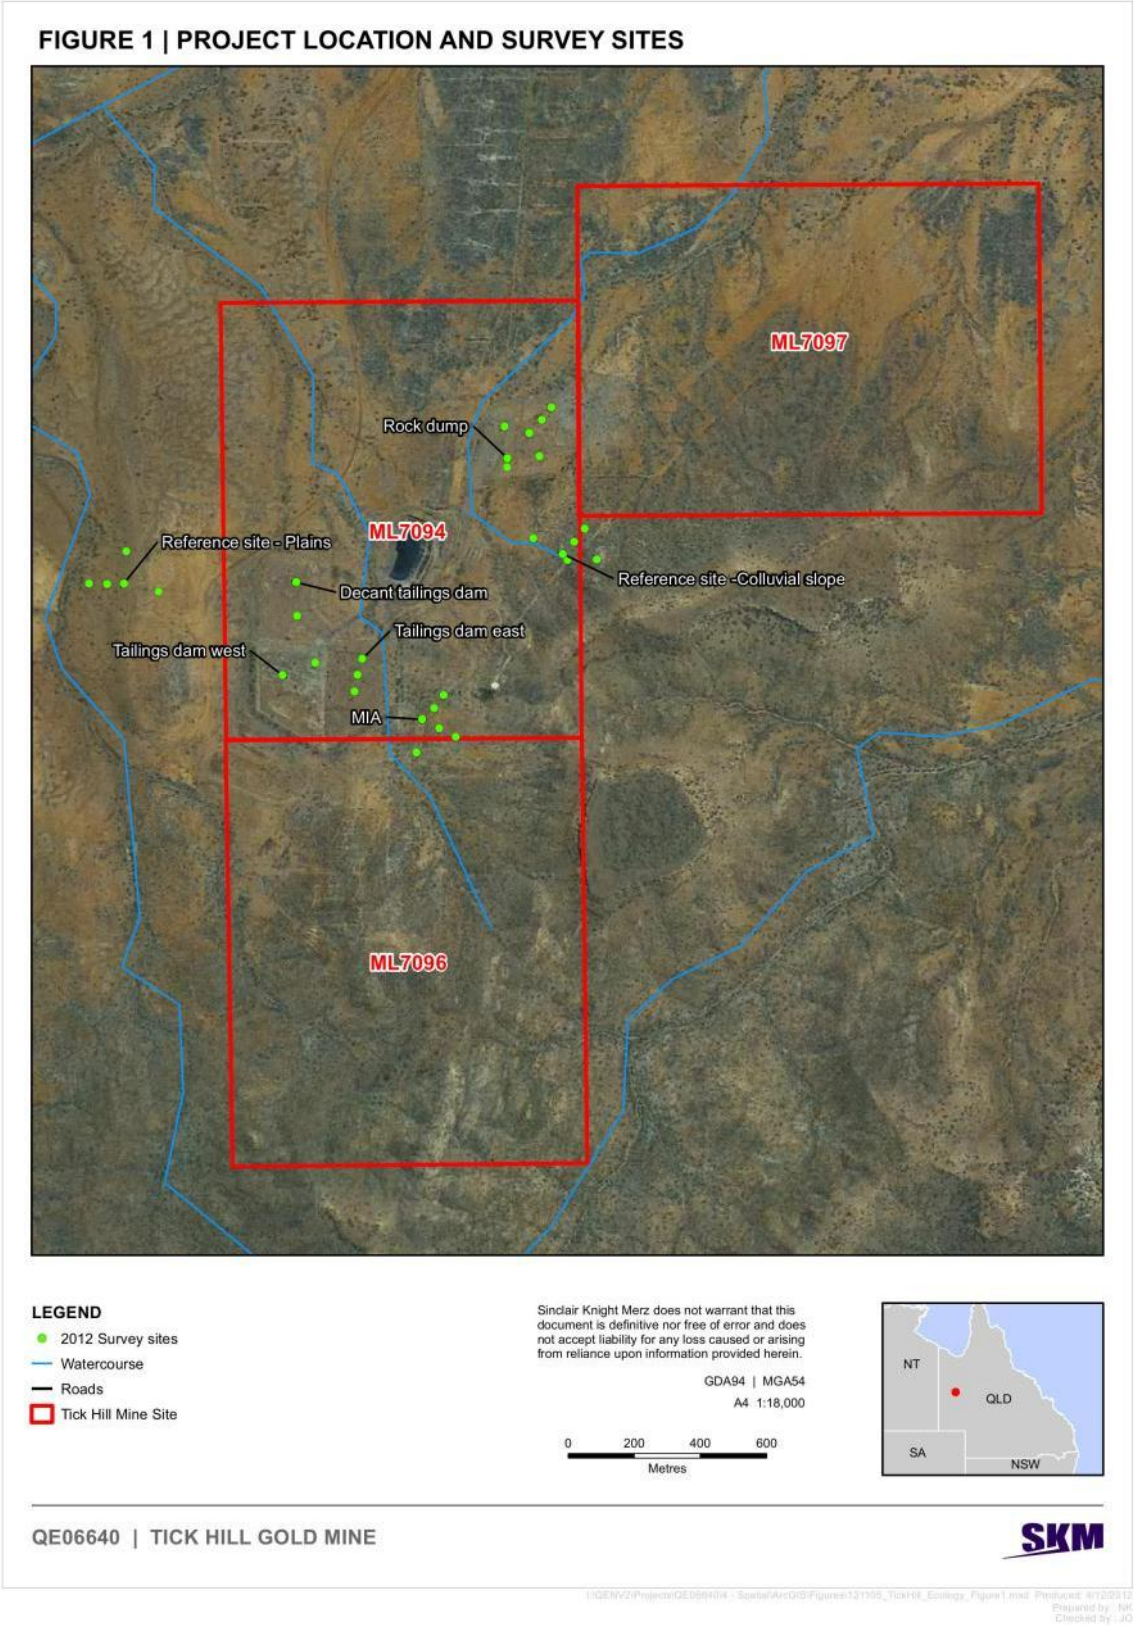

Figure 4-1: Tick Hill Flora Survey Locations

Benchmark data

DEHP publishes benchmark documents that list typical characteristics of undisturbed forms for each RE. The benchmark data draw on survey data from the Queensland Herbarium's CORVEG database and reference sites. These data are summarized to provide information specific to each regional ecosystem. In rangeland ecosystems, seasonal conditions can account for wide variation in the values obtained for some attributes assessed in BioCondition. Therefore, the benchmark data for the rangeland ecosystems is expressed as range, rather than as a single benchmark value. When using rangeland regional ecosystem benchmarks to assess vegetation condition, the lower value of the benchmark range can be used as the benchmark, or if assessing a site under good seasonal conditions then use of the average value as the benchmark (Queensland Herbarium, 2012a).

The benchmark document for RE 1.11.3 is contained in **Appendix E** and a comparison of the survey data with the benchmark attributes are shown in **Table 4-2**:.

Table 4-2: BioCondition data for RE 1.11.3 compared with survey data

Benchmark attributes for RE 1.11.3	Benchmark Data	Tailings dam	Rock dump	MIA	Colluvial slope	Plains
Recruitment of dominant canopy species (%)	100	0	100	100	0	50
Native tree species richness	0-9	3	1	1	1	2
Native shrub species richness	1-14	5	5	4	9	3
Native grass species richness	2-11	0	0	1	1	3
Native forbs and other species richness	4-20	1	2	2	1	1
Tree canopy median height (m)	3-10	7	3	7	7	8
Tree canopy cover (%)	2-29	7	0	2	0	3
Tree sub-canopy median height (m)	N/A	N/A	N/A	N/A	N/A	N/A
Tree sub-canopy cover (%)	N/A	N/A	N/A	N/A	N/A	N/A
Number of large eucalypt trees per hectare (threshold = 30cm)	no data	0	0	0	0	0
Number of large non-eucalypt trees per hectare (threshold = 20cm)	no data	0	0	0	0	0
Native shrub cover (%)	0-85	1	12	1	21.9	1
Native perennial grass cover (%)	10-91	0	0	4	55	14
Organic litter cover (%)	0	11	4	14	14	7
Coarse woody debris	0	0	0	1.5	0	2
Non-native plant cover (%)	None listed	54	53	49	0	0

4.2 Fauna

Informal observations of the habitat values at survey sites indicated that the colluvial slope site provided the most complexity of habitat, including rock crevices, dense clumps of Spinifex and a dense shrub layer. These habitat features provide suitable habitat for a range of reptiles, small birds and mammals.The rehabilitation sites (tailings dam, rock dump, MIA) were dominated by buffel grass and had fewer habitat features apart from a mosaic of dense ground cover patches.

4.3 Geotechnics

Field observations comprised a walkover of the tailings dam, decant pond, and waste rock emplacement on 11 October 2012. Conditions were windy and overcast on the day of inspection with two short (up to 5 minutes in duration), very light scattered showers between 8 am and 12 pm. The ground appeared dry. There was approximately 5 mm of rainfall during the previous night. A visual inspection was made of the rehabilitated surfaces with a particular emphasis on:

- whether there were any depressions or sink holes in re-profiled surfaces;
- whether any slumping or bulging was evident on the batters;
- whether there was any bulging at the toe; and
- whether there was any scouring on batters.

No ground investigations were performed as part of this exercise. Photographs are included in **Appendix F**.

4.3.1 Tailings dam

The tailings dam is a "turkey's nest" construction in which a perimeter embankment with a clay core retains tailings. Its height varies between approximately 6m and 10.5m and the outside batter angle is at 1V:3H. Since the time of decommissioning in 1995, the surface was capped and the surface and batters were seeded. Surface water is directed to flow towards the spillway due to the perimeter embankment being approximately 0.3m higher than the retained capped tailings.

Vegetation has covered the surface of the tailings dam and the batters. At the time of inspection, there were no visible signs of scouring, slumping or bulging of any of the batters or the toe of the embankments. There were also no signs of sink holes or slumping on the top surface.

The spillway showed no signs of erosion and the wire rock protection was intact and in good condition. Vegetation has covered the area relatively evenly, as shown in **Plate 4-5** and in the photographs in **Appendix F**.

Plate 4-5: Downstream of the spillway viewed from the spillway crest

The rehabilitated tailings dam is fulfilling the DEHP rehabilitation requirements that are summarised in **Appendix A**. It has a very low residual risk associated with instability and scouring. Based on the performance in the last 17 years, it is reasonable to expect that stability will be maintained in the future and scour will not become an issue.

Surface gully erosion to the west of the tailings dam was noted in XMIM's 2004 audit. The erosion was noted in this inspection and is shown in **Plate 4-6**. Surface runoff during heavy rainfall is the likely cause.

Plate 4-6: Surface gully erosion to the west of the tailings dam

The surface erosion poses very little risk to the tailings dam and decant pond stability. Treatment of erosion could include the periodic placement; say every 25 m, of rock check dams to reduce the water velocity. This could be performed whilst remediating scour to the western face of the decant pond (see below). Given the depth of the "gullies" (up to approximately 0.3 m deep) and the length (approximately 200 m), it is not likely to add significantly to the estimated cost of remediating the decant pond scour.

4.3.2 Decant pond

The decant pond is a "turkey's nest" construction in which a perimeter embankment with a clay core retains tailings. Its height varies between approximately 2 m and 6 m and the outside batter angle is at 1V:3H. Since the time of decommissioning in 1995, the surface was capped and the surface and batters were seeded.

Vegetation has covered the surface of the decant pond and the batters, as shown in **Plate 4-7** and the photographs in **Appendix F**. At the time of inspection, there were no visible signs of slumping or bulging of any

of the batters or the toe of the embankments. There were also no signs of sink holes or slumping on the top surface. However, there was a localised depression of approximately 1 m with a diameter of around 20 m. It is likely that this was the final profile when the decant pond was decommissioned. This location is approximately the furthest away point from the spillway. The approximate location of the depression is circled and labelled in **Plate 4-7**.

Two adjacent scour channels were observed half way along the western batter and their locations are circled in **Plate 4-7**. This was also noted in XMIM's 2004 audit. Their profile is approximately 0.5 m deep x 1 m wide x 6 m long. There were no other signs of scour or erosion.

It is recommended that the scour lines be remediated to prevent deterioration of the localised area in the long term. Two remediation alternatives could be to:

1. Allow the drainage path to continue as is and line the scoured sections with rock to prevent further scour. The rock lining would effectively turn the channels into water drop structures; or
2. Fill the scoured sections with rock and construct a low localised bund (approximately 0.3 m high and 0.4 m wide) along the western crest of the embankment in order to redirect the flow.

The first option is likely the best solution both in terms of expense and long term performance since rock could be sourced from higher "mounds" found on the top of the waste rock emplacement and the direction of the water flow will be maintained. This would present a very low residual risk. It is estimated that this work should be able to be complete for a maximum of $9,000. The second option would cost about the same amount but the residual risk would be slightly higher than the first option since there would not be certainty that the issue would not be inadvertently transferred to another location.

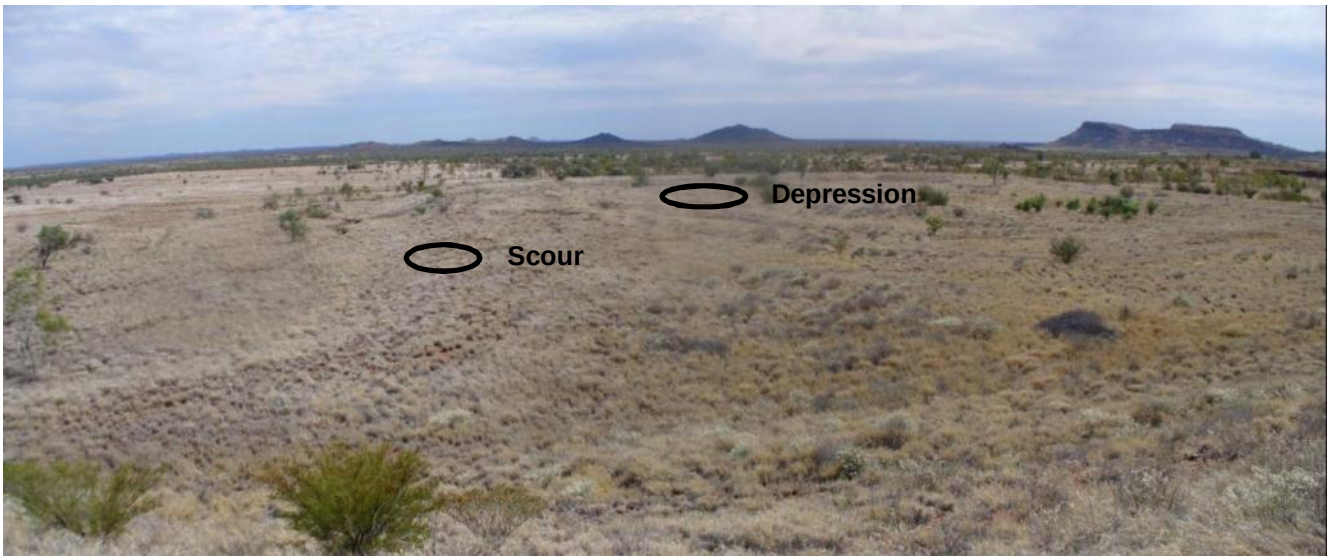

Plate 4-7: Decant pond batter scour and surface depression (viewed from NW corner of tailings dam)

4.3.3 Waste rock emplacement

The waste rock emplacement is a homogeneous construction of waste rock material. The construction sequence comprised a homogeneous waste rock perimeter embankment which was progressively filled. Its height varies between approximately 6m and 14m and the outside batter angle is at 1V:3H. Water generally flows towards a drain, which is 4m wide with 1V:3H batters, that exits at the south-west corner. Since the time of decommissioning in 1995, the surface was capped and the surface and batters were seeded. The final height was lower than the planned 20m height because the final pit floor was 80 m rather than approximately 100m below ground level as originally intended.

Vegetation has covered the surface of the waste rock emplacement and the batters, as shown in **Plate 4-8** and the photographs in **Appendix F**. At the time of inspection, there were no visible signs of slumping or bulging of

any of the batters or the toe of the embankment. There were also no signs of sink holes or slumping on the top surface.

Plate 4-8: Waste rock emplacement surface and batters (looking NW from the NE corner)

There were three eroded/scoured gullies up to 0.5 m deep approximately midway along the northern batter, as shown in **Plate 4-9**. This was identified in 2000. No other batter erosion or scouring was observed.

Plate 4-9: (a) Scouring at protrusion midway along the N batter (b) Scouring midway along N batter

It is recommended that the scour lines be remediated to prevent deterioration and destabilisation of the localised area in the long term. The successful remediation works implemented in the SE corner in 1998 should be adopted in this instance. It will involve filling the erosion/scour with rockfill and constructing a rockfill bund at the crest to ensure that water flows to the drain and not over the crest of the batter. Material could be sourced from mounds on top of the waste rock emplacement (one shown circled in **Plate 4-10**).

If there is not enough material in the mounds then excavation into the surface of the waste rock emplacement is feasible. A wide and shallow excavation (up to 0.5 m deep) leaving a surface profile with 1V:6H batters could be implemented. Seeding of the disturbed area would then be required. It is estimated that this remediation method would cost approximately $10,000 and would present a very low residual risk of further scour.

Plate 4-10: Top of waste rock emplacement looking E with drain in foreground (viewed from midway along W batter)

Approximately 10 m west of the western batter toe lies a drainage path. Some scouring of the drainage path, approximately 0.5 m deep, has occurred over time (shown in **Plate 4-11**). The resulting face is subvertical. The face on the western side of the drainage path is stable and follows the weathered rock foliation at approximately 1V:1.5H.

Past geotechnical investigations at the site indicate that the subsurface profile comprises approximately 1.7 m of highly weathered (HW) rock (schist) below which lies moderately weathered (MW) rock. The excavated HW rock remoulded to clayey gravel (GC). Test pits refused with a backhoe at the moderately weathered rock level. Given the indicated subsurface profile, further scouring at the eastern side of the drainage path is possible down to the MW rock. From visual interpretation of the geometry of the natural surface, the drainage path and the toe of the waste rock emplacement, it is estimated that MW rock is approximately up to 1 m to 1.5 m below the current level of scouring. The proximity of the toe to the drainage path can be seen in **Plate 4-12**.

It is not likely that possible further scouring of the drainage path will negatively impact the stability of the toe of the waste rock emplacement since the scouring depth would need to be approximately a further 3 m in order to do so. Therefore, no remediation is anticipated, however; regular monitoring should confirm if scouring occurs, it does not negatively impact the stability of the toe of the waste rock emplacement.

Plate 4-11: Drainage line down from the W batter with scour on the eastern side (looking S)

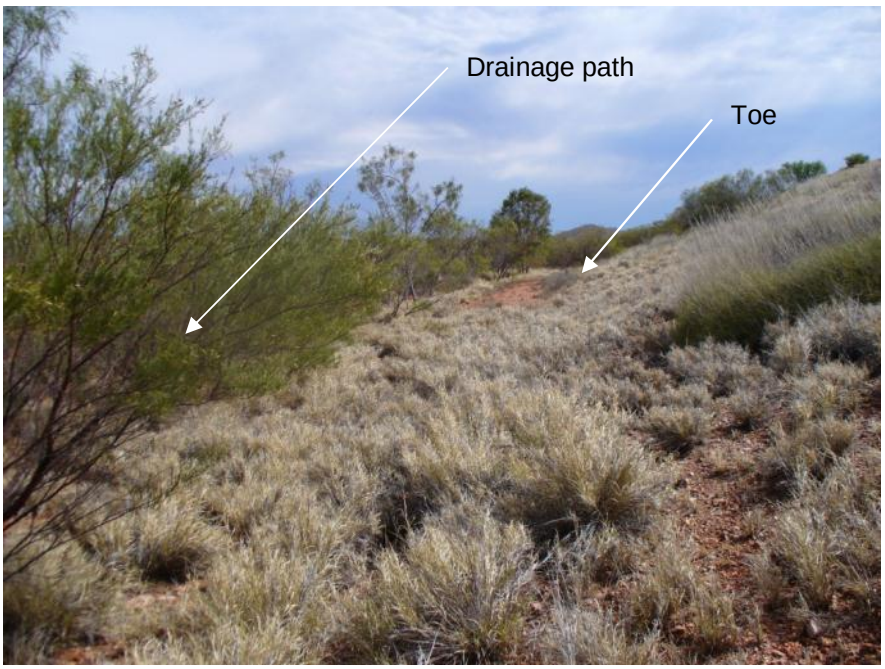

Plate 4-12: Western toe of waste rock emplacement (viewed from SW corner)

4.3.4 Borrow pits

The borrow pits were reported to be to the south-west of the mine pit and west of the tailings dam and up to 0.3 m deep. XMIM's 2004 audit noted that the borrow pits were rehabilitated. The location of the borrow pits could not be readily identified in this site inspection as the profile and vegetation type and density in these areas is similar to the surrounding undisturbed areas. Refer to **Plate 4-13** and **Plate 4-14** for the possible locations of the borrow pits to the south-west of the mine pit and west of the tailings dam.

Plate 4-13: Inferred approximate location of the borrow pit SW of the mine pit

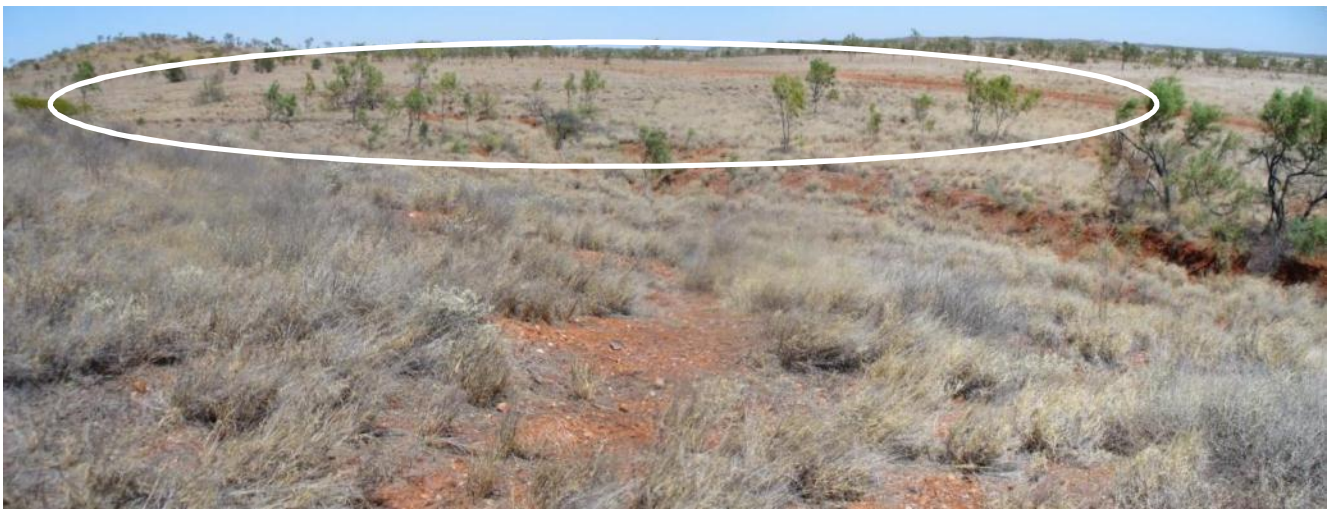

Plate 4-14: Inferred approximate location of the borrow pit W of the tailings dam

Stability of the borrow pits is not considered to be an issue.

4.4 Soils

The following notes are presented in mine domain areas and summarise observations made of the site during the October 2012 field inspection. Observations were made at the points presented in **Table 4-3**.

Table 4-3: Observation Point co-ordinates

Mine Domain	S	E
Waste Rock Dump		
1	21°38.646	139°55.776
2	21°38.612	139°55.790
3	21°38.583	139°55.807
4	21°38.580	139°55.773
5	21°38.569	139°55.784
6	21°38.547	139°55.772

4.4.1 Waste Rock Dump (WRD)

4.4.1.1 Flat-Top Area

The following observations related to **Plate 4-15** and **Plate 4-16.**

- The flat-top area of the WRD is sparsely vegetated with grasses and trees.
- Soil profile is likely derived from a mixture of Kandosol and Rudosol soils. Soil horizon (A) is thin (<100 mm) and contains appreciable quantities of gravel and boulder sized particles.
- The flat-top surface has been constructed in a hummocky fashion and consists of peaks and depressions. Depressions are have accumulated fines during ponding of water, however they are generally poorly vegetated.
- The flat-top surface is not graded towards the spill-way and a number of erosion sites are evident on slopes (discussed below).
- The surface of the WRD is showing evidence of termite activity. This will likely reduce the effectiveness of the covers ability to reduce water infiltration.
- Termite activity and cover thickness indicate that the soil cover on the flat-top surface of the WRD are not sufficiently designed to reduce / restrict water infiltration. If pyrite is present in waste rock then there is likely sufficient infiltration to allow transport of oxidation products (termed acid rock drainage) from the waste rock dump.

Plate 4-15: Panoramic view of the flat-top area of the WRD

(a) (b)

(c) (d)

Plate 4-16: Flat-top surface condition (a-c) accumulations of fines in low point depressions (d) termite mounds

4.4.1.2 Slopes (1V:3H)

The following observations relate to **Plate 4-17** and **Plate 4-18.**

- The flat-top surface is not graded towards the spill-way and a number of erosion sites are evident on slopes around the perimeter of the WRD.
- Slopes are generally vegetated to greater than 50% surface cover. Most sites of erosion appear to be stable and exhibit hard-panning and concreting of particles long the edges of eroded gullies.

4.4.1.3 Spill-way

The WRD spill-way is in generally good condition with minor erosion present (**Plate 4-19**).

4.4.1.4 Other

There is an ephemeral creek (**Plate 4-18**) running adjacent to the WRD along one side. Visual inspection did not indicate undercutting of the WRD toe.

(a) (b) (c)

Plate 4-17: Gully erosion formed on outer slopes of the WRD

Plate 4-18: Ephemeral Creek adjacent to WRD

Plate 4-19: Spillway

4.4.2 Tailings Storage facility (TSF)

The following observations related to **Plate 4-20**:

- The flat-top area of the TSF is sparsely vegetated with grasses and trees.

- Soil profile is likely derived from a mixture of Kandosol and Rudosol soils. Soil horizon (A) is thin (<100 mm) and contains appreciable quantities of gravel and boulder sized particles.
- Cover thickness indicates that the soil cover on the flat-top surface of the TSF may not be sufficiently designed to reduce / restrict water infiltration. If pyrite is present in tailings then there is likely sufficient infiltration to allow transport of oxidation products (termed acid rock drainage) from the TSF.
- Outer batter slopes of the TSF have been regraded to low slope angles (approx 1V:6H), with little evidence of erosion. Where erosion was noted in was classified as minor gullying and surface sheet erosion.

(a) (b)

(c)

Plate 4-20: Tailings Storage facility (a-b) Flat-top surface (c) Batter slopes

4.4.3 TSF Spillway and Sediment Dam

The following observations related to **Plate 4-21**.

- The TSF Spillway is an engineered structure designed as gabion baskets. There is no visual evidence of erosion, or deterioration of the structure.
- The decant pond at the base of the spillway structure did not show significant signs of erosion. Erosion is present in the batter slopes of the decant pond.

(a) (b)

Plate 4-21: Spillway

4.4.4 Mine Industrial Area (MIA)

The mine industrial area is clear of debris. Vegetation establishment in this area appears appreciably lower then surrounding areas and may warrant further investigation.

4.5 Groundwater

A site visit was conducted by SKM staff on 11th October 2012 in which the presence of Bore 1 and Bore 2 was confirmed. Groundwater levels were not measured and no groundwater samples were collected. No other bores were identified on site or in the vicinity of the site.

4.6 Contaminated Land

Contaminated Land specialised staff were not present during the October 2012 site visit due to the non-invasive intent of the visit. Photographs and anecdotal information was provided by those SKM personnel involved in the site visit.

5. Discussion

5.1 Flora

5.1.1 Ground cover

Reduction in ground cover between 1999 and 2012 is significant at the plains (reference site), however no significant changes were detected at the other survey locations.

Ground cover percentage is considered to be the most important character to monitor, as the aim of the rehabilitation is to return the land to its previous use as grazing land and maintain soil stability. Monitoring ground cover gives an indication of soil erosion hazard, biodiversity potential and grazing productivity.

The percentage of bare ground appears to have no significant change between the 1999 and 2012 surveys, indicating the amount of plant material (live plus dead) has remained reasonably constant. However it should be noted that the sample size at each survey location (3) is very small and as such the confidence in the result is not high.

Visual observation of the previously disturbed mine areas indicates that the current ground cover is self-sustaining and cover levels are sufficient to prevent soil erosion.

5.1.2 BioCondition benchmark

In comparing the data collected from the project area and the benchmark data for RE1.11.3, the following points were notable:

- Native grass and other ground cover species richness was consistently lower than the benchmark at all survey locations, including the reference sites. This may have been factor of the very dry conditions resulting in a general paucity of fertile material making differentiation and detection of species difficult.
- Tree canopy cover was below the benchmark at the rock dump, and surprisingly also on the colluvial slope, as this site appeared to have been subject to very little disturbance.
- Organic litter cover was higher than the benchmark at all sites, presumably due to the abundance of dead buffel grass adding to the litter layer.

Apart from these divergences, all other indicators measured using the BioCondition methodology were within the ranges specified in the benchmark document (Queensland Herbarium, 2012a).

5.1.3 Rehabilitation performance

DEHP provides rehabilitation objectives, indicators and completion criteria in *Guideline 18: Rehabilitation requirements for mining projects*. This report is relevant to two of the suggested objectives. These are discussed in **Table 5-1**. The objectives and completion criteria have been modified to suit the intended return of the project area to grazing land.

Table 5-1: Rehabilitation objectives, indicators and completion criteria

Objective	Indicators	Completion criteria	Discussion	Compliance
Vegetation cover to minimise erosion	Vegetation type and density	Evidence that the vegetation type and density are of species suited to the spoil/waste composition, slope, aspect, climate and other factors, and that the measured erosion rates meet the limits set (only relevant to stability where root systems are a major control of erosion).	Vegetation in the project area has a higher percentage of exotic species than at the reference sites, however the dominant species, buffel grass, is known to be well suited to the soil types, climates and other factors. Very little erosion was observed within the project area, indicating the vegetation density is sufficient to minimise erosion.	Yes
	Foliage cover	Evidence that the percent cover meets the set values based on the regional assessment of cover requirements (Note: Values in excess of 70% are typically needed to protect surface soils from rain-induced erosion. In arid areas achievable values are likely to be much lower (perhaps less than 50%) and in high rainfall areas the values may be higher).	Percent cover ranges from 14% to 55% (predominately made up of native and exotic grasses). The benchmark for RE 1.11.3 lists native perennial grass cover as 10-91%. As such, the recorded range falls within an expected range for the vegetation community.	Yes
	Leaf litter, humus	Evidence that nutrient cycling is occurring and the presence of leaf litter is assisting in limiting erosion of the soil/spoil surface.	Organic litter cover recorded ranges from 4% to 14% which is well above the benchmark of zero (**Table 4-2**).	Yes
Establish specified self-sustaining natural vegetation and/or grazing land.	Presence of key species	Certification that key species are present	Species listed in the RE description are *Corymbia terminalis, Eucalyptus leucophylla, E. leucophloia, Acacia* spp. and *Triodia* spp. Species recorded during the field survey included *Corymbia terminalis*, *Eucalyptus leucophylla*, *Acacia chisholmii*, *Acacia ligulata* and *Triodia* spp.	Yes
	Species type and diversity suitable for grazing.	Certification that species mix is suitable for grazing.	The groundcover within the project area consists of buffel grass and some native perennial grasses. This is a suitable mix for grazing.	Yes
	Abundance of weeds	Certification that weed management successful	No declared weeds were recorded in the project area.	Yes

5.2 Fauna

Dedicated fauna surveys were not conducted for the purposes of this report. This is considered a reasonable approach in this situation because:

- comparing results from a current fauna survey to the 1999 results would not be statistically strong as the previous survey was conducted over only five nights. At least ten days/nights are needed to record the full suite of species present; and
- it is unlikely that the previous survey conditions could be replicated with respect to weather, soil moisture, food availability and overall land condition.

5.3 Geotechnical

5.3.1 Stability analyses

A long term stability analyses using the limit equilibrium stability with Slope/W (Version 7.18) was performed on the tailings dam, decant pond and waste rock emplacement.

5.3.1.1 Geotechnical model

Kinhill Cameron McNamara's Impact Assessment Study Report (1991) describes the subsurface profile as approximately 1.7 m of residual soil, derived from weathered schist, overlying weathered schist bedrock. The residual soil was reported to remould to the consistency of clayey gravel.

The Geotechnical Report attached in Appendix C of the Impact Assessment Study Report lists the material parameters as (KCM, 1991):

Rockfill outer zones	c' = 0 kPa, ϕ' = 37°
Clay core	c' = 20 kPa, ϕ = 34°
Foundation	c' = 0 kPa, ϕ = 40°
Dry density of tailings	13 kN/m^3

The above material parameters were adopted in the stability analyses.

5.3.1.2 Stability analysis assumptions

For the tailings dam and decant pond, it was assumed that the clay core was constructed as per the design with 1V:1.5H batters. Additionally, the maximum embankment heights used were as reported in the Final Plan of Operations (Dames & Moore, 1999) as 10.5 m for the tailings dam, 6 m for the decant pond and 14 m for the waste rock emplacement. Visual site observations and the contour profile in the Final Plan of Operations (Dames & Moore, 1999) confirm the heights. It was assumed that the tailings were saturated to one third of the embankment height. Material parameter assumptions for the coupled seepage and stability analyses included:

Rockfill outer zones	γ = 18 kN/m^3, k_{sat} = 1 x 10^{-3} m/s
Clay core	γ = 18 kN/m^3, k_{sat} = 1 x 10^{-8} m/s
Foundation	γ = 18 kN/m^3, k_{sat} = 1 x 10^{-7} m/s

The density values are conservative for the purposes of stability analysis.

For the earthquake analysis, the maximum design earthquake (MDE) was using ANCOLD guidelines and AS 1170.4 *Earthquake actions in Australia* were used with the following design parameters:

- Probability factor (k_p) = 1.3 (1/1000 annual probability of exceedence) (AS 1170.4 Table 3.1)

- Hazard factor (Z) = 0.035 (AS 1170.4 Figure 3.2(F))
- Site sub-soil class = C_e - shallow soil (AS 1170.1 Clause 4.1.1)
- MDE (k_pZ) = 0.0455 g

5.3.1.3 Stability results

A summary of the stability analysis results for the long term and earthquake conditions are as shown in **Table Table 5-2**: Stability analyses results for the tailings dam, decant pond and waste rock emplacement with the graphic representations shown in **Appendix G**.

Table 5-2: Stability analyses results for the tailings dam, decant pond and waste rock emplacement

Earth structure	**Factor of safety**			
	Long term	**Long term cutoff**	**Earthquake**	**Earthquake cutoff[1]**
Tailings dam	1.80	1.50	1.57	1.0
Decant pond	1.77	1.50	1.53	1.0
Waste rock emplacement	2.40	1.50	2.09	1.0

Note: 1. Cutoff from USACE (1970)

The results show that the tailings dam, decant pond and waste rock emplacement should be stable in the long term and under an earthquake with 1/1000 annual probability of exceedence.

5.3.1.4 DEHP compliance criteria

The tailings dam and decant pond are referable dams under the Water Resources Act 1989. The following conditions apply (DEHP, 2001):

1. The dams must be constructed as Turkeys Nest dams since they are greater than 3000m^3;
2. Seepage is to be minimised;
3. The dam should be operated to maintain a minimum freeboard of 1m;
4. The spillway should be capable of passing the design flood (1 in 100 year event); and
5. The batters shall be no steeper than 1V:2.5H (upstream batter) and 1V:2H (downstream batter) for clayey gravel (GC).

The embankments were constructed as Turkeys Nest dams with GC material with batter angles of 1V:3H. Seepage was minimised due to their clay cores with cut-off trenches down to MW rock. The tailings dam and decant pond have been decommissioned and rehabilitated (capped). All surface water on the tailings dam channels to the spillway due to the surface grade and that the perimeter embankments are approximately 0.3m to 0.5m higher than the level dam surface. The level of rehabilitation complies with the Decommissioning Criteria. In summary, the tailings dam, decant pond and waste rock emplacement are expected to be stable over the long term and comply with the decommissioning/rehabilitation criteria of the DEHP's Code of environmental compliance for Mining Lease Projects January 2001 - Version 0.

5.4 Soils

There remains some residual risk that should be considered as XMIM progresses towards relinquishment:

1. Capillary rise of sulfate salts into topsoil. If sulfate / sufide is present in waste rock and tailings then there is potential for capillary rise to bring these salts to the surface of the soil profile. Sulfate concentration near surface will result in vegetation die back.
2. Erosion will continue to degrade the rehabilitated soil profile and may result in reduced vegetation establishment.
3. The presence of acid rock drainage may require further earthwork to contain seepage and to construct covers capable of restricting infiltration into both the WRD and TSF.

6. Conclusions and Recommendations

6.1 Terrestrial Flora

Results indicate the rehabilitation in terms of establishing a self-sustaining vegetation cover suitable for soil stabilisation and grazing has been successful.

Management measures should be targeted to maintain the current conditions, including:

- limit vehicle access during times when soil is vulnerable to disturbance, i.e. wet season conditions;
- limit vehicle movement to established tracks;
- maintain fence lines to exclude stock, or if stock are introduced, adjust stocking rates to suit conditions; and
- avoid disturbance to drainage line vegetation.

6.2 Geotechnical

Visual inspection and preliminary limit equilibrium stability analyses of the tailings dam, decant pond, and waste rock emplacements indicates that the design and construction is adequate to maintain long term stability.

The batters, toes, spillway and surface of the tailings dam have performed well in the last 17 years. There appears to be adequate vegetation cover, water drains to the spillway, and the batters and toes show no signs of bulging or instability.

Scouring was observed in the western batter of the decant pond, the northern face of the waste rock emplacement, in the drainage channel approximately 10m to the west of the waste rock emplacement, and surface gully erosion west of the tailings dam. Whilst it currently does not impact on the global stability, localised stability issues are likely to occur in the long term if the scouring is not addressed.

It is recommended that the scouring on the western face of the decant pond be rock-lined to prevent further scouring. This will also maintain the existing water drainage path. Whilst lining the scouring at the decant pond, small rock check dams should be placed along the shallow gully erosion path to the west of the tailings dam in order to significantly reduce the risk of further scouring. The mounds of rock fill on top of the waste rock emplacement could be used as a source of rock. It would be prudent to seed the exposed areas following rock placement. It is estimated this work would cost approximately $9,000 and significantly reduce the residual risk of further scouring. Following the remedial works, the decant pond batter stability is not expected to be an issue.

It is recommended that the scouring in the northern batter of the waste rock emplacement be filled with rock fill and a bund placed at the crest to ensure surface water flows to the drain which exits at the SW corner. The mounds of rock fill on top of the waste rock emplacement could be used as a source of rock. Seeding of the disturbed ground should also occur. It is estimated that this work would cost approximately $10,000 and significantly reduce the residual risk of further scouring. After performing this remedial work, batter stability is not expected to be an issue.

The scouring of the drainage channel approximately 10m to the west of the toe of the waste rock emplacement does not affect its stability. The extent of further possible scouring is not expected to present a stability issue to the western batter.

6.3 Soils

It is recommended that rehabilitated sites are sampled and compared to an undisturbed analogue to determine gradients for sulfate / sulfide and fertility within the rehabilitated soil profile. This can be compared to existing government guidelines for GQAL, SCL and Land Suitability to establish the health of the rehabilitated landscape.

Erosion monitoring should be conducted post-wet season for a minimum of two seasons to ensure that the site does not have active erosion occurring.

It is recommended that the site develops and monitors groundwater quality to determine the potential for acid rock drainage.

It is also recommended that an investigation of the former MIA area be completed to determine the likely cause of poor vegetation establishment in this domain.

6.4 Groundwater

Based on the limited data available for the Tick Hill site, SKM has developed a broad range of conclusions on the THGM groundwater knowledge:

- Due to the impermeable nature of the host rock, groundwater flow is likely to be structurally controlled with flow occurring along joints and fractures.
- Depth to groundwater is at least 20 m below ground surface, therefore it is unlikely that groundwater dependant terrestrial vegetation would exist on site.
- Intra-annual variations may occur in groundwater levels, but it is difficult to attribute a seasonal cause to this observation.
- There are no data to define the baseline hydrogeological conditions existing prior to mining, and therefore the pre mining environmental values of the groundwater, however, it is likely that groundwater was no more saline than it is now, suggesting that the beneficial use (stock water) has been maintained.
- Due to the relatively higher EC of the pit void in early 2012 (4,720 µS/cm), compared to the EC of groundwater measured at Bore 1 (1,699 µS/cm) and Bore 2 (2,808 µS/cm), the pit void is likely to be acting as an evaporative sink, with groundwater flowing into the pit void and undergoing evaporative concentration within the pit void.
- Data quality of some data is questionable, particularly in regard to groundwater level data at Bore 2 in April 1997, and pH data for Bore 1 and Bore 2 in July 2004
- The limited groundwater samples collected from Bore 1 and Bore 2 are below the ANZECC 2000 guidelines for stock water for all major ions and metals, where guidelines have been established for these analytes.
- The major ionic composition of groundwater sampled in April 2012 is distinct from the pit void water sampled in March 2012.
- The spatial distribution and temporal variation of groundwater levels are unknown.
- The spatial distribution and temporal variation of groundwater quality are unknown at a regional level.
- The current groundwater monitoring network and data collected are inadequate to define water quality objectives.
- The current groundwater monitoring network and data collected are inadequate to determine potential impacts of mining on the local to regional-scale groundwater system.
- No post mining water balance model has been developed.

The likely environmental receptor at the THGM site is watering of stock from pumped groundwater. As the pit void is likely to be acting as an evaporative sink, groundwater flow would be towards the pit void, with no impact on the surrounding groundwater quality from the pit void. Some impact to groundwater level may have occurred as a result of induced groundwater flow towards the pit.

For XMIM to assess the potential impacts to groundwater quality for stock water at THGM so as to fulfil the regulatory requirements under the EP Act and enable the THGM site to be formally closed and relinquished, SKM recommends the following:

- Survey the existing bores and pit lake level (install permanent gauge board) to common height datum.
- Expand the current monitoring bore network to include at least 3 new bores, with the network to be representative of all aquifers and structural features present across the site. All bores must be drilled and constructed by a licensed water bore driller in accordance with the Minimum Construction Requirements for Water Bores in Australia, 3rd Edition (National Uniform Drillers Licensing Committee, 2012) and overseen by a qualified hydrogeologist.
- Survey the ground elevation and top of bore casing at the location of each new monitoring bore.
- Conduct a bore census of surrounding properties within 3 km of the THGM leases, to search for any registered and unregistered bores, and determine their status and groundwater use.
- Monitor groundwater levels for a period of at least 12 months, by installing an electronic data logger in each bore, to assist in defining the spatial distribution and seasonal variation of groundwater levels.
- Take quarterly groundwater samples from each bore, and quarterly pit void samples, for a period of at least 12 months, to define the spatial distribution and seasonal variation of groundwater and pit void water quality. Adequate water sampling, preservation and shipping protocols should be followed, eg. Monitoring and Sampling Manual 2009 (Queensland Department of Environment and Resource Management, 2009).
- Review collected groundwater quality data to establish lower and upper background limits for relevant parameters and refine existing water quality objectives.
- Determine the aquifer hydraulic conductivity by conducting falling or rising head tests in bores.
- Collate and interpret all data to develop a conceptual hydrogeological model of the site, which should include: geological and hydrostratigraphic framework, recharge-discharge processes, and any interactions with natural water courses (if they exist) and the pit void.
- Based on the conceptual model, prepare a site water and salt balance using an analytical spreadsheet model, to determine if the pit void is acting as an evaporative sink.

To gain an understanding of the THGM site with sufficient information for completion of a PRR, it is recommended that XMIM proceed as shown in **Figure 6-1**.

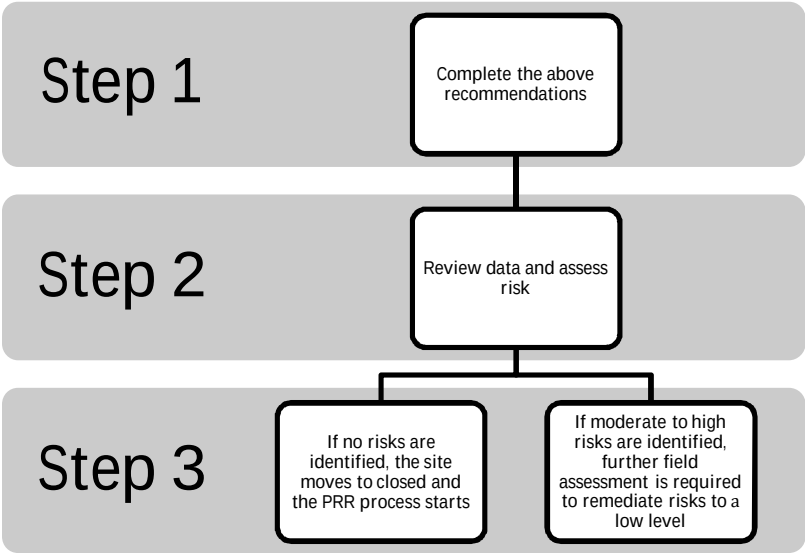

Figure 6-1: Groundwater Steps to Initiate PRR Process

Step 3 in **Figure 6-1** should be approached from a low cost and conservative assessment perspective, only becoming more complex if risks are identified as being unacceptable.

6.5 Contaminated Land

Insufficient information is available to assess the current contaminated land status of the site. Insufficient investigation and documentation is available to obtain sign off on remediation by the DEHP. Insufficient supporting information on supporting studies including hydrology and hydrogeology is available to assess whether unacceptable environmental impacts regarding land contamination, are occurring (or expected to occur) from the site in its present condition.

An investigation of the site is required to produce verifiable data to determine whether the site in its present condition satisfies the DEHP goals for mine closure, (i.e. safe to humans and wildlife, non-polluting, stable and able to sustain an agreed post-mining land use).

A contaminated land assessment (Preliminary Site Investigation) should be undertaken as defined in the Guideline for Contaminated Land Professionals (DEHP, 2012). The assessment should consider further details on site history i.e. source and location of potentially contaminating activities (e.g. former industrial areas) and an assessment of soil, groundwater and surface water across the site (targeting potentially contaminating activities).

Any contaminated land assessment undertaken should be integrated with surface water, groundwater, pit void and tailings capping studies. Environmental or Human Health Risk Assessment may be required dependent on the contaminant source, pathways and receptors identified. Risk assessment will require integration of the contaminated land assessment findings with information including:

- Groundwater: Assess this contaminant migration pathway/receptor in terms of aquifer permeability (i.e. contaminant fluxes), groundwater flow direction (i.e. receptor), and connection between the groundwater and surface water receptor.
- Surface Water: Assess this receptor in terms of surface runoff and migration of groundwater from the site.
- Water Balance: Assess the potential for groundwater flow direction to change over time (i.e. potential for water flowing to the pit void to invert based on water levels within the pit) and percentage of water reporting as runoff (i.e. potential for exposure of underlying contaminated soils) and deep drainage) i.e. potential for leakage through the base of tailings dams.

- Landform Stability: Assess the potential for gross failure of containment structure i.e. dam walls and therefore the potential for contaminated soil to be exposed at the surface. Assess the potential for erosion to expose underlying contaminated soils. Some of these stability issues have been discussed in **Sections 3.3** and **4.3**.
- Capping Assessment: Assess the potential for contamination within tailings storage facilities to be exposed through capillary rise of salts to the surface of the rehabilitated dams or from secondary processes associated with salt accumulation in the capping (or lack of water in the capping) i.e. loss of surface vegetation resulting in erosion of the cap.
- Acid Rock Drainage: assess the potential for ARD to occur and therefor the potential for mobilisation of contaminants in ARD leachate.

Based on the outcome of these studies, any remedial activities required to manage contamination should be implemented. Areas where contamination is to remain in a managed non-polluting state (i.e. tailings dams, pit void) should be managed.

6.5.1 Additional Auditor Role

Although no requirement currently exists for the appointment of an Auditor as defined in the Greentape Reduction and Other Legislation Amendment Act (2012), consideration should be given to the voluntary appointment of an Auditor (who is separate to the site investigator) due to:

- Site Complexity: Given the number of potentially contaminating activities previously operating on the site, potential for secondary processes to be contributing to contamination and the complexity of soil-groundwater-pit void-surface water interaction.
- Site Age: As the site has been previously levelled and information on the site (i.e. location of contaminating activities) may be difficult to obtain.
- Introduction of Greentape Reduction and other Legislation Act: Although no definition has currently been provided by EHP on which sites will require an Auditor. If an Auditor is required now or identified later, the Auditor may require additional assessment works to be undertaken which may delay report submission and sign off. The early voluntary appointment of an Auditor would address this matter.
- Changes to EHP: The level of technical knowledge (and therefore guidance) provided by EHP is expected to be limited following recent losses of technical personnel at EHP. In lieu of this technical guidance, EHP may mandate the use of an Auditor or may result in EHP requiring much more conservative remedial targets than may identified by the Consultant and agreed by the Auditor.
- Future Site Use: As the future site use is not certain (i.e. use for a further mining activity, grazing), the remediation targets may be different.
- Timing: Historically, the timing for review of remediation of complex sites and approval of subsequent management plans by EHP has been lengthy.

6.5.2 PRR

Following any remedial works and implementation of management plans, regular PRR should be completed in accordance with the DEHP approved Site Management Plan(s).

7. Environmental Audit Results

The environmental audit undertaken by SKM has been documented in the standalone Tick Hill Gold Project – Audit Statement report.

In summary, XMIM performed well in demonstrating conformance with the administrative requirements of the environmental authority and Code, and in avoiding impacts to air quality and noise amenity. Minor issues were noted in relation to erosion and sediment control from the perspective of localised impacts occurring, however conformance was observed due to the fact that sedimentation of watercourses has not occurred. Notwithstanding this, SKM has included recommendations in relation to erosion and sediment control to assist XMIM in avoiding the long term deterioration of selected areas.

XMIMs conformance with the remaining eight conditions was not able to be determined with an acceptable degree of certainty, due to the information gaps identified during the desktop and site reviews. SKM found that there is a general lack of historical information on the rehabilitation activities that were carried out at the site including waste disposal and acid rock drainage management. Furthermore, the historical monitoring data does not allow accurate conclusions to be made about the hydrogeological aspects of the site. These combined factors have resulted in an overall lack of scientific certainty when it comes to identifying contaminants and their pathways to receptors, meaning that the environmental risk of the site is not well understood.

As stated in the Tick Hill Gold Project – Interim Rehabilitation Report, SKM recommends that XMIM conduct further investigations at the site with the aim of developing a better understanding of the environmental risks presented by the site. This would entail:

- Developing an understanding of the source of contaminants on site. This would include conducting a contaminated land assessment (preliminary site investigation) as defined in the Guidance for Contaminated Land Professionals (DEHP, 2012).
- Developing an understanding of the likely contaminant pathways and hydrogeological aspects of the site. This would include developing a conceptual hydrogeological model of the site built from robust groundwater and surface water monitoring data.
- Addressing instances of localised erosion to safeguard the long term viability of the rehabilitation work.

The specific recommendations are described in the standalone Tick Hill Rehabilitation Audit Statement (refer to Audit Protocol [Appendix A] for detail).

QUEENSLAND GOVERNMENT

1 Introduction

1.1 Purpose

This guideline is to assist mining companies to propose acceptable rehabilitation outcomes and strategies during the planning stages of a mine or when changes to the proposed rehabilitation outcomes and strategies become necessary during the operational stages of a mine.

The guideline also explains how the administering authority[1] will assess whether progressive or final rehabilitation for either new or established mining projects is satisfactory. Assessment will be based on the accepted rehabilitation objectives for each domain within the mine site and monitoring of indicators to demonstrate that the completion criteria have been met and are likely to be sustained for an acceptable period. Establishment of early contact with the administering authority through pre-design conferencing is recommended to ensure there are “no surprises” in the later stages of the assessment process. Similar contact during any proposal to change rehabilitation outcomes or to obtain progressive certification or final sign-off is also recommended.

1.2 Scope

This guideline applies to level 1 (larger) mining projects and to both progressive and final rehabilitation.

The guideline does not apply to level 2 mining projects, which have simplified rehabilitation requirements listed in relevant codes of environmental compliance. This guideline is not to be used to interpret the standard environmental conditions in those codes.

1.3 Structure of the guideline

Section 1 provides an introduction to the guideline. Section 2 describes the policy and legislative frameworks that provide direction for mine rehabilitation outcomes. Section 3 lists the goals that the Government expects rehabilitation to achieve. Sections 4, 5 and 6 describe how a mining company should develop site-specific rehabilitation strategies comprising:

- rehabilitation objectives for each domain in a mining project;
- indicators that can measure progress towards the objectives;
- completion criteria that are consistent with the rehabilitation goals set by Government and with the rehabilitation objectives established in the environmental authority for each domain in a mining project.

Section 7 describes the assessment process that will provide transparent and consistent decisions for progressive and final rehabilitation based on the rehabilitation goals, objectives, indicators and completion criteria for the mining project. Section 8 describes how existing mining projects with inadequate rehabilitation objectives, indicators or completion criteria will be assessed.

1.4 Other relevant guidelines

The following guidelines should also be consulted:

- Deciding the Level of Impact Assessment for the Mining Industry (EM579[2])
- Final and Progressive Rehabilitation Reports and Audit Statements for Level 1 Mining Lease Projects (EM610)
- Calculating Financial Assurance for Mining Projects (EM585).

[1] The Department of Environment and Heritage Protection is the administering authority under the *Environmental Protection Act 1994*.

[2] This is the publication number, which can be used as a search term to find the latest version of the publication at <www.ehp.qld.gov.au>.

2 Policy and legislative framework

2.1 Policy framework

Unlike most other industrial activities, each mining operation is expected to cease in the foreseeable future. This generally occurs when its finite resources are depleted. However, like other industries, a mining operation may also cease when production costs exceed returns or as a result of an unrelated management decision. The closure of a mine provides opportunities for land disturbed by mining to be rehabilitated to one or more sustainable post-mining land uses. Technological advances and changing market conditions in recent decades have facilitated the development of many new mines and increased production at existing mines. There have also been changes in community expectations about the management of the impacts of mining. These factors have focused the attention of regulatory authorities on mine rehabilitation.

National Strategy for Ecologically Sustainable Development *(COA 1992)* (NSESD) promotes economic growth that safeguards the welfare of future generations, provides equity within and between generations, protects biological diversity and maintains essential ecological processes and life support systems. The ecologically sustainable development (ESD) framework includes the "polluter pays" principle, i.e. those who generate pollution and waste should bear the cost of containment, avoidance or abatement. To ensure sound environmental practices throughout the industry, NSESD also sets several objectives for mining including development of rehabilitation policies based on:

- repairing the land so its ongoing maintenance needs are consistent with those of equivalent unmined land under equivalent land use;
- rehabilitation requirements that are open to public scrutiny;
- treating rehabilitation and mine closure as integral components of the planning and operation of mines.

The Australian and New Zealand Minerals and Energy Council (ANZMEC) and the Minerals Council of Australia (MCA) jointly published the *Strategic Framework for Mine Closure (ANZMEC 2000)*. The framework recognised that the mining industry is responsible for rehabilitation of mine disturbance in an environmentally and socially acceptable way. It considered mine planning, stakeholder involvement, financial provisioning for rehabilitation, implementation, standards and relinquishment; and developed the following key principles:

- legislation should provide a broad regulatory framework for the mine closure process;
- standards of rehabilitation should be acceptable and achievable;
- completion criteria are specific to each mine and should reflect its unique set of environmental, social and economic circumstances;
- an agreed set of indicators should be developed to demonstrate that successful rehabilitation has been achieved;
- targeted research will assist both government and industry in making better decisions about rehabilitation.

In 2003, the International Council on Mining and Metals (ICMM) adopted 10 principles for sustainable development for mining. Specific elements of Principles 4 and 6 included:

- consulting interested and affected parties[3] on all significant impacts;
- regularly updating risk management systems;
- providing safe disposal of waste and process residues;

[3] Similar consultation requirements are included in ss. 38 and 39 of the *Environmental Protection Act 1994* in regard to environmental impact statements.

- rehabilitating land in accordance with appropriate post-mining land use.

The MCA sought government input when it developed *Enduring Value (MCA 2004)*. That publication provides a framework for implementing the ICMM principles in an Australian context and indicates that effective rehabilitation planning and implementation are intimately linked to the "social licence to operate". The ICMM has stated that the mining industry's contribution to sustainable development is dependent on ensuring acceptable long-term environmental performance of mine rehabilitation (ICMM, 2005).

The mining industry has been working with Australian governments to improve the mutual understanding of how rehabilitation can minimise the future impacts of mining activities. During the 1990s, the Commonwealth Government supported the development of a series of booklets on *Best Practice Environmental Management in Mining*. The Commonwealth Department of Resources, Energy and Tourism are currently replacing this series with booklets in the series *Leading Practice Sustainable Development Program for the Mining Industry.*

2.2 Rehabilitation hierarchy

In assessing the acceptability of rehabilitation objectives, indicators and completion criteria that may be proposed for a mining project, the administering authority will have regard to a hierarchy for mine rehabilitation that is similar to the waste hierarchy. The strategies listed higher in the hierarchy should be adopted in preference to those listed lower, unless there are significant environmental, economic or social issues that override such a selection. The rehabilitation hierarchy, in order of decreasing capacity to prevent or minimise environmental harm, is:

1. avoid disturbance that will require rehabilitation
2. reinstate a "natural" ecosystem as similar as possible to the original ecosystem
3. develop an alternative outcome with a higher economic value than the previous land use
4. reinstate previous land use (e.g. grazing or cropping)
5. develop lower value land use
6. leave the site in an unusable condition or with a potential to generate future pollution or adversely affect environmental values.

In determining whether it is feasible to achieve levels in the top half of the hierarchy, the applicant and the administering authority should consider the pre-mining land use, any compensation or other agreements regarding the land, the potential uses of likely rehabilitated landforms and existing use or environmental values of surrounding land.

Developing a lower value use may be acceptable if that use is acceptable to the relevant stakeholders and all higher strategies are impractical. Leaving the site in an unstable condition or with potential to cause environmental harm will rarely be acceptable.

In general there is a higher risk of future environmental harm after the mine closes if the strategies listed lower in the hierarchy are adopted. However a "lower value" land use may be more sustainable in terms of preventing off-site impacts, especially if the post-mining land use makes an economic return that is sufficient to maintain the rehabilitation. To manage a site so that the potential for on-going environmental harm is kept to acceptable levels, future monitoring and maintenance may be required. For this reason, the acceptance of a rehabilitation strategy involving outcomes lower in the hierarchy may mean that, when progressive or final rehabilitation is assessed, the company may have to make larger payments to cover the remaining residual risk (see the guideline Calculating Financial Assurance for Mining Projects (EM585) for a discussion of residual risk and related payments).

2.3 Legislative framework

In Queensland, rehabilitation is required under the *Environmental Protection Act 1994* (EP Act)[4], which has as its object the attainment of ESD. The principles in the NSESD must be considered in decision-making under the EP Act. Section 4(6) of the EP Act requires that all reasonable and practicable measures are taken to protect environmental values from all sources of environmental harm and requires persons who cause environmental harm to pay costs and penalties for the harm. The fundamental reasons for rehabilitation are to reduce the apparent disturbance caused by authorised mining activities and to minimise the potential for future environmental harm.

Section 9 of the EP Act defines environmental values as characteristics of the environment that are conducive to environmental health or public amenity or safety, as well as qualities of the environment declared to be environmental values by an environmental protection policy (EPP) or a regulation. The environmental values listed in the EPP for water are the suitability of water for recreation, drinking, agriculture, industrial use and maintaining biological integrity; the environmental values listed in the EPP for air are qualities that are conducive to suitability for life, health and human wellbeing; and the environmental values listed in the EPP for waste management are life, health, human wellbeing, diversity of ecological processes and ecosystems, and land use capability (having regard to economic considerations).

Sections 201 to 203 of the EP Act requires all level 1 mining projects to have an environmental management plan (EM plan) which states the objectives for progressive and final rehabilitation as well as measurable indicators and standards (called completion criteria in this guideline) that are to be achieved. An EM plan is used to help the administering authority prepare the draft environmental authority for a mining project. The administering authority must be satisfied with the rehabilitation before it can certify progressive rehabilitation for part of a mining project or accept the surrender of an environmental authority for the whole or part of a project. The administering authority decision is based on an assessment of either a progressive rehabilitation report for part of the project (s.266G) or a final rehabilitation report (s.274) for the whole project or a part being surrendered. The holder of the environmental authority for mining activities must prepare a progressive / final rehabilitation report and submit it to the administering authority for assessment. The administering authority must consider the relevant completion criteria (s.266K or s.278) when deciding whether to certify progressive rehabilitation or whether to approve a surrender application. See Section 7 below and the guideline Final and Progressive Rehabilitation Reports and Audit Statements for Level 1 Mining Lease Projects (EM610).

Under the current legislation it is difficult to enforce future land use constraints for rehabilitated land after the mining tenement has been relinquished. Appropriate post-mining land use may require some form of statutory constraint to future land use in order to prevent or limit the extent of “inappropriate post-mining land use”. The options currently available include:

- specific land tenure (protected estate, reserve, etc.);
- lease conditions (e.g. term lease under *Land Act 1994*);
- covenant (freehold, perpetual lease); or
- site management plan (for contaminated land).

The various legislative / administrative steps and their associated timeframes relating to rehabilitation during the life of a mine are shown schematically in Figure 1.

[4] A small number of mines operating under Special Agreement Acts have their rehabilitation requirements set under the *Mineral Resources Act 1989* and/or the relevant Special Agreement Act.

Figure 1 - Elements of the rehabilitation process for a mine

	Regulatory elements	Company-controlled elements	Timeframe
Pre–mining		Exploration and feasibility studies – including baseline studies and planning possible rehabilitation objectives	3 to 10 years
		Pre-design conference	1 week
		Apply for environmental authority (EA)	
	EIS requirement decision (the administering authority (AA))		10 bd[5]
		Prepare EIS, if required, and/or environmental management plan (EM plan)	Up to 12 months
		Submit EM plan – including commitment to rehabilitation objectives, indicators and completion criteria	
	Assess EM plan (the AA)		30 bd
	Prepare draft EA (the AA)		10 bd
	Public notification		At least 28 days
	Objections hearing if required		3 to 6 months
	Issue final EA (the AA) – including conditions defining rehabilitation objectives, indicators and criteria		10 bd
During mining		Progressive rehabilitation and monitoring	
		Apply for progressive certification	
	Assess progressive rehabilitation report (the AA refers to progressive rehabilitation advisory committee)		30 bd
	Decide application (the AA)		10 bd
		Adjust financial assurance	
Post–mining		Apply for surrender of EA – including final rehabilitation report and residual risk calculation	
	Assess final rehabilitation report (the administering authority refers to PRAC)		30 bd
	Decide application and advise holder of decision (the AA)		10 + 10 bd
		Lodge any residual risk payment	
		Post-closure management (if required)

3 General and specific rehabilitation goals

3.1 General rehabilitation goals

In this guideline, the Government's policy objectives for rehabilitation are called rehabilitation goals to distinguish them from the rehabilitation objectives selected by mining companies in their rehabilitation strategies for a particular mine. The rehabilitation goals have been developed from the ESD policy framework, especially in relation to intergenerational equity; polluter pays principle, protection of biodiversity and maintenance of essential ecological processes.

The four general rehabilitation goals require rehabilitation of areas disturbed by mining to result in sites that are:

- safe to humans and wildlife[6];
- non-polluting;
- stable;
- able to sustain an agreed post-mining land use.

3.2 Site specific goals

There may be specific additional goals that are relevant at some mine sites. These may be indirectly identified by Government through requirements under other legislation dealing with matters such as endangered species, water, registered heritage places or regional or local planning. For example, there may be requirements to:

- establish vegetation communities that are demonstrably similar to a pre-existing ecosystem (especially where native vegetation is the proposed land use);
- establish or enhance the habitat of an endangered species (especially where the mining has affected such habitat);
- restore stream patterns where there has been a temporary stream diversion;
- achieve water quality that meets some specific beneficial use;
- maintain or restore some specific aesthetic values;
- preserve specific European and indigenous heritage that has been registered for the site (note that these values are managed under other legislation); or
- achieve specific socio-economic outcomes (e.g. restore high value agricultural land necessary to maintain a viable rural industry).

4 Rehabilitation objectives for a mine

4.1 Setting rehabilitation objectives

Rehabilitation objectives must provide a clear description of proposed rehabilitation outcomes within the individual domains[7] in the mine site. One domain may contain elements that require different rehabilitation. If the elements are essential components of a single land management unit, e.g. a waste rock dump with battered slopes and a flat top, it is preferable for the elements to be included in the same domain (with different rehabilitation objectives) rather than to be treated as separate domains. The rehabilitation program for a mine

[6] Human safety at mine sites is largely managed under the *Mining and Quarrying Safety and Health Act 1999* and the *Coal Mining Safety and Health Act 1999* but fauna safety is not covered in those Acts. It will generally be appropriate to consider both human and fauna safety when designing rehabilitation under environmental legislation.

[7] Domains are defined in Appendix C.

site must address the general rehabilitation goals listed in Section 3 and any relevant site-specific goals. To ensure that the mine fulfils its environmental, economic and social responsibilities within the ESD principles, the rehabilitation objectives must:

- address potential environmental impacts;
- achieve the highest practicable level in the rehabilitation hierarchy;
- identify post-mining land uses that are acceptable to the community, local government and any other relevant stakeholders.

The first steps in identifying the potential environmental impacts for a level 1 mining project will generally be baseline environmental investigations and consultation with local residents and other interested parties to identify the environmental values in the proposed mining lease and adjoining areas. Economic or social studies may also be undertaken. The mining company is advised to seek a pre-design conference with the administering authority at this stage in the planning of the mining project. While the main purpose of a pre-design conference is to assist the applicant to identify potential environmental issues at the site, it also allows the applicant to propose a stakeholder consultation program for discussion. The administering authority may give an indication that a stakeholder consultation program proposed by the applicant is satisfactory for the development of rehabilitation conditions that will be used for assessment of progressive and final rehabilitation. Any agreements between the applicant and stakeholders should be committed to writing and, where it is relevant to the rehabilitation requirement, should be forwarded to the administering authority with the relevant application.

The second step is to develop ways to prevent or minimise the potential environmental impacts from mining and mineral processing activities that may occur on the site. Both the design of the mine and the rehabilitation strategies will be influenced by the spatial distribution of the various environmental values, the potential impacts and the costs associated with the various options for preventing or minimising the impacts. An environmental impact statement (EIS) will be required if the project exceeds the triggers in the guideline Deciding the Level of Impact Assessment for the Mining Industry (EM579). Another consideration is how to minimise the residual risk associated with the rehabilitation. If that risk is too high (i.e. issues are identified that have the potential to result in significant failure of the rehabilitation in the future, say within 30 years), the administering authority may not accept the rehabilitation. In some cases, a high risk may be accepted if the residual risk payment was sufficient to cover the expected maintenance of the rehabilitation. However, the Government is unlikely to accept the role of long-term involvement with a large number of mine sites.

Other matters that may influence decisions about selecting a rehabilitation strategy include:

- the conservation value of a proposed environmental outcome;
- the importance to the local community of the economic productivity of the proposed future land use;
- the consistency of the proposed land use with local and regional plans;
- the long-term ownership of the affected land.

Mine rehabilitation provides opportunities to restore ecosystems or create wildlife corridors which may produce major environmental benefits in all or part of the mining lease. There will also be cases where rehabilitation of a mine site may not be able to achieve future economic productivity that is comparable to the pre-mining situation. Irrespective of the rehabilitation outcome, the environmental authority holder must ensure that the rehabilitation will endure normal climatic variations and the agreed post-mining land will be sustained so that future generations are not paying maintenance costs that are higher than those normally incurred for the same land use on unmined land. To achieve this, the rehabilitated land may need to have constraints placed on its future

use (e.g. a site management plan for contaminated land or a nature refuge) making any future land owner responsible for meeting those constraints[8].

The final step in setting the objectives is to include them in the EM plan. This makes them publicly accessible and provides guidance to management and workers on the need to conduct activities on the site in a way that is consistent with the future use. They must also be stated in a way that allows the development of measurable indicators that can be audited against the completion criteria. Table 1 gives examples of strategies that contain a range of objectives for different mine domains. It does not attempt to identify all possible domains, nor does it list all possible strategies for any domain. The EA holder proposes both the domains and the strategies.

4.2 Combining the rehabilitation hierarchy with the rehabilitation goals

For each of the goals there may be many rehabilitation strategies that can be developed and applied to a mine. It is possible that the rehabilitation requirements for different domains at a mine may be significantly different. For example, a waste rock dump domain will require a different rehabilitation approach than a tailings storage facility. Rehabilitation strategies for each domain should be developed and documented in the EM plan for the mine.

Table 1 provides some examples of how the hierarchy described in Section 2.3 might be applied to establish the possible rehabilitation strategies that would achieve the main rehabilitation goals for particular mine domains. The table has not covered all the possible strategies or all potential post-mining land uses, which can be widely divergent (e.g. nature conservation, grazing, cropping, waste disposal, water supply, etc). Nor does Table 1 specify which strategy will be acceptable in a particular locality for a specific mine.

It is probable that strategies in the top row of Table 1 would be considered to produce satisfactory rehabilitation if the strategies are implemented effectively. Strategies in the middle row of the Table may be accepted in some circumstances but will generally have a higher residual risk payment associated with them. Strategies in the bottom row will rarely be acceptable.

4.3 Describing rehabilitation objectives in the EM plan

Sections 189 and 203 of the EP Act require environmental protection commitments in the EM plan for exploration or mining projects. The Act lists rehabilitation objectives as an example of these commitments. They are the basis for the conditions of the environmental authority. The conditions are initially agreed between the proponent and the administering authority (on behalf of all stakeholders) when the authority is granted. If there is no agreement, the conditions may be decided by the Land Court.

The EM plan must describe the proposed rehabilitation of the mining disturbance and how it will control future environmental harm to an acceptable level. As part of the progressive rehabilitation certification process and final surrender application, the environmental authority holder will be required to submit a risk assessment that documents the probability and consequence of future environmental harm across each of the rehabilitated domains. Where there is potential for future environmental harm, the cost to remediate this harm must be calculated in order to decide whether a residual risk payment is required, see the guideline Calculating Financial Assurance for Mining Projects (EM585).

During mine planning, the post-mining land use must be identified, as this is a controlling factor in setting rehabilitation objectives that are consistent with the goals described in Section 3.1 and in defining how rehabilitation success will be measured.

[8] The administering authority is considering extending the concept of a site management plan to ensure appropriate post-surrender land management where contamination is not an issue. The intent is to require a third party to implement a management plan prepared by the mine operator to minimise future risk. Funding (if not covered by the compensation agreement) and the third party's level of responsibility for the management plan will require further consultation.

Definition of the final land use is essential for the assessment of the long-term environmental impacts of the project by the administering authority and is typically required for the development of realistic life-of-mine costs in feasibility studies that will be assessed by the project financiers. It is also necessary for calculating financial assurance as that is based on the third party costs of rehabilitation, which cannot be calculated if the final land use is not specified. Consultation with the landowner, the local community and other stakeholders is essential when considering the future land use.

Other rehabilitation objectives may be determined through a risk assessment of the proposed mining operation and mine closure where that process identifies hazards likely to prevent the achievement of the rehabilitation goals. The objectives will focus on the end result of the rehabilitation and will not normally describe in detail how the hazards can be avoided or managed to achieve the agreed future land use. The end result must, to the maximum extent possible, be maintenance free and require no future management intervention beyond the normal land management practices for the post mining land use. The future landholder will be responsible for the management and maintenance requirements when undertaking any post mining land use at the site. A regular review of the objectives is desirable as mine plans and technology change frequently.

Achievement of short term objectives may not deliver rehabilitation outcomes that are considered sustainable in the long term i.e. centuries. Decision-making should involve stakeholders who have been provided relevant information about possible future impacts developed through a thoroughly documented risk assessment process which considers the likelihood and consequence of hazards being realised.

During the environmental impact assessment of a project, several rehabilitation options may be proposed. However, the resulting EM plan for the mining project must clearly identify the intended land use and other rehabilitation objectives for the mine at the domain level and cover the relevant rehabilitation goals listed in the previous section for each domain within the whole site. The objectives must be specified in sufficient detail to allow the administering authority to assess long-term impacts and for the community to understand the post-mining condition of the site. For a mining lease, this information is made public and objections may be lodged. Objections are considered by the Land Court and the recommendations that come from the objections hearing may result in changes to the proposed land use or other objectives before the lease is granted. The objectives must be clearly reflected in the environmental conditions for the project.

The typical details required in the EM plan for each domain within the mine site include:

- **Safety measures** – If safety hazards remain at mine closure or inevitably will develop after closure, solely as a result of the mining activities (e.g. steep slopes, exposure of hazardous materials, subsidence or potentially unstable structures), the EM plan must indicate what management controls will be implemented to reduce risks to humans or animals. These may include exclusion of access to unstable areas, waste rock characterisation and segregation or selective management of hazardous wastes. These measures complement any requirements under the *Mining and Quarrying Safety and Health Act 1999* or *Coal Mining Safety and Health Act 1999*.
- **Water management and water quality** – Details of any reconstructed water courses or proposals to contain surface water on the site must be provided. The risk of any significant environmental harm resulting from potentially contaminated water entering surface waters or groundwater must be considered. An assessment of the possible quality of water impounded in a final void or surface dam must be provided. This is likely to be based on a model and will require an ongoing monitoring program to verify the predicted water quality and hydrology so that modifications can be made to the rehabilitation plans if water quality trends or flow rates are found to vary from the predicted values in a way that is likely to cause a significant increase in the resultant environmental harm.
- **Landforms** – There must be a clear indication of the post-mining topography of the site. The final shape of waste rock heaps, tailings dams and voids must be indicated on a contoured plan at a suitable scale. The

choice of landforms must be supported by an assessment of the factors that will affect long-term stability with particular reference to hazardous materials, protective capping, geotechnical stability, and surface stability under the proposed post mining land use.

- **Land use** – The proposed post mining land use must be clearly specified using terms such as grazing (up to a particular intensity), cropping (including type of crop), forestry plantation (for a specified type of wood), habitat (for a nominated species), or return to native vegetation (see next dot point). Indicating that the land will achieve a specific land capability class (DME 1995) will generally not be sufficient description of the proposed land use. The prior land capability and use of the site, the existing uses of adjacent land and the views of landholders when selecting the future land use should be considered.
- **Vegetation** – When establishing native vegetation is one of the rehabilitation objectives for the mine site, the EM plan must specify the ecosystem(s) or habitats that are intended to be developed on the rehabilitated domains. The plan may also nominate reference / analogue sites that will be used for comparison.
- **Socio-economic objectives** – An example of when such objectives might be considered is where mining occurs on good quality agricultural land and there is an agreement that the land is to be returned to a similar productive use so that it will support a viable community similar to what was there before mining.

4.4 Changing or amending objectives

Should circumstances or knowledge change during the life of the mine, rehabilitation objectives and completion criteria may need to be reviewed. If substantial changes to the rehabilitation objectives are involved, there must be a transparent amendment process that gives the public an opportunity to comment on significant changes. The current process allows the environmental authority holder to apply for a change to the objectives through an amendment of the environmental authority. In such cases the rehabilitation goals applying at the time of the application will be taken into account. It is considered good practice for the mining company to consult community members who are likely to be affected by the changes before the amendment application is lodged.

5 Rehabilitation indicators

5.1 Defining good indicators

Rehabilitation indicators provide defensible measurements of progress towards the rehabilitation objectives. Environmental indicators may involve the measurement of a single parameter or they may involve the amalgamation of measurements of several parameters into an index or model. There could be several indicators for one objective and one indicator may have relevance to more than one objective. Some may be important over a wide area while others may have a local significance or relate to how a particular objective is to be achieved for a particular mine. Although there will be site-to-site variations in the indicators, some regional groupings are expected to emerge as knowledge improves and is shared among companies and consultants.

The properties of a good indicator (CSIRO 1998) are that it:

- has an agreed, scientifically sound meaning;
- represents an environmental aspect of importance to society;
- tells us something important and its meaning is readily understood;
- has a practical measurement process;
- helps focus information to answer important questions;
- assists decision making by being effective and cost-efficient.

Table 1 - Possible strategies to achieve rehabilitation goals for various domains[9]

PART A – Domains involving surface features including final voids, shafts, audits, subsidence

OUTCOMES	GOALS			
	SAFE	NON-POLLUTING	STABLE LANDFORM	SUSTAINS AGREED LAND USE
Generally acceptable	• Backfill to original ground level (or higher to allow for settlement. • Seal or install bat gates for shafts and audits • Structurally sound; safe to people and animals; • No hazardous materials • Treat hazardous material • Remove hazardous material	• Contains good quality water • Moderate quality but no connectivity • Low risk of groundwater contamination or overflow but monitoring and management in place	• Backfill voids and shallow shafts • Stable collar and capping or cover for shafts • Battered slopes with vegetative cover	• Natural ecosystem restored • Alternative high value use, e.g. water reservoir, good quality agricultural land, recreational use
May be acceptable	• Cover hazardous material with benign material or water • Build safety barriers	• Void acts as a sink or reservoir for contaminated water with minor risk to stock or wildlife	• Battered moderate slopes with little vegetation • Steep slopes in competent rock	• Waste disposal (if site approved under *Sustainable Planning Act 2009)* • Industrial or commercial land use • Unused void with low risk
Rarely acceptable	• Contains exposed hazardous materials (e.g. potentially acid forming or containing heavy metals)	• Poor water quality that poses a high risk to stock or wildlife	• No action but site is structurally unsound, geotechnical instable, a threat to nearby sensitive places and infrastructure	• Accumulates hazardous material

[9] Not all of these structures may be grouped in the same domain. However, similar matters will have to be considered in developing the rehabilitation outcomes for areas that have been used for these activities. There may be more than one domain of any particular type of activity within a single mine if the rehabilitation outcomes are going to be different because of variations in the topography, adjoining land use, scale of activity or other considerations.

Table 1: Continued

PART B - Domains involving solid waste disposal[10]

OUTCOMES	GOALS			
	SAFE	NON-POLLUTING	STABLE LANDFORM	SUSTAINS AGREED LAND USE
Generally acceptable	• Structurally safe, no hazardous materials • Structurally safe, treated hazardous material	• Runoff and seepage will be good quality water that is unlikely to affect known environmental values	• Place wastes below natural land surface (i.e. below grade). • Place wastes above natural surface with minimal slopes (e.g. less than 5°)	• Reinstate original ecosystem • Create a different use with enhanced environmental, economic or social values acceptable to stakeholders • Return to previous use/ condition
May be acceptable	• Structurally safe, hazardous material adequately contained	• Potential for pollution of water that is managed by: • Natural low groundwater connectivity (demonstrated by hydrological studies) • Impervious capping or lining • Store and release capping	• Place wastes above ground with moderate slopes	• Return to previous use, or a different use with reduced environmental, economic or social values (evidence that use is acceptable to stakeholders would be essential). • Managed constrained use
Rarely acceptable	• Uncontained or inadequately contained hazardous materials	• Waste disposal facility contains inadequately managed severely contaminated water or water requiring continuing treatment	• Place above ground with angle of repose slopes	• Unusable contaminated site that is not adequately managed

[10] Solid wastes include rejects, waste rock dumps, heap leach pads and general refuse disposal facilities.

Table 1: Continued

PART C - Domains involving tailings dams

OUTCOME	GOAL			
	SAFE	**NON-POLLUTING**	**STABLE LANDFORM**	**SUSTAINS AGREED LAND USE**
Generally acceptable	• Structurally safe (appropriate certification against relevant code) - no hazardous materials • Structurally safe - treated hazardous material	• Runoff and seepage will be good quality water that is unlikely to affect known environmental values	• Stored in redundant pit below natural surface level with appropriate erosion control • Outer walls designed for long term stability • Vegetation cover established and preventing erosion	• Reinstate original ecosystem • Create a different use with enhanced environmental, economic or social values acceptable to stakeholders • Return to previous use/ condition • Site management plan in place and effective
May be acceptable	• Containment of hazardous material but limited strengthening of walls or capping	• Eliminate inflow • Breach wall to prevent ponding • Armoured impervious capping with capillary break if needed • Store and release capping • Collect and treat seepage	• Appropriate maintenance program proposed	• Return to previous use, or a different use with reduced environmental, economic or social values (evidence that use is acceptable to stakeholders would be essential). • Manage constrained use
Rarely acceptable	• Unstable poorly designed structure	• Seeping contaminated water to surface or ground water	• High risk of instability and structural failure	• Unusable contaminated site that is not adequately managed

Table 1: Continued

PART D – Infrastructure

OUTCOMES	GOALS			
	SAFE	NON–POLLUTING	STABLE LANDFORM	SUSTAINS AGREED LAND USE
Generally acceptable	• No hazardous structures or chemicals used in mine • Avoid effects of hazardous materials on site by restricting use to fully contained facilities which are cleaned and removed from site • Treat hazardous materials • Remove hazardous materials	• After removal of infrastructure - runoff and seepage will be good quality water that is unlikely to affect known environmental values • Remediate contamination so that runoff and seepage will not have unacceptable effects on known environmental values	• Allow continued use of permanent infrastructure that is stable or is managed under a maintenance program • Remove infrastructure, re-shape disturbed areas to resemble surrounding landscape and establish adequate vegetation cover	• Avoid areas of remnant vegetation by locating infrastructure on previously cleared areas • Reinstate original ecosystem • Create a different use with enhanced environmental, economic or social values acceptable to stakeholders • Return to previous use/ condition
May be acceptable	• Containment of hazardous materials	• Minimise runoff or seepage tat is likely to have unacceptable effects on known environmental values e.g. by eliminating inflow through impervious capping • Collect and treat seepage	• Erosion rates higher than surrounding areas but an appropriate maintenance program proposed	• Return to previous use, or a different use with reduced environmental, economic or social values (evidence that use is acceptable to stakeholders would be essential). • Managed constrained use
Rarely acceptable	• Unsafe poorly designed structure	• Seeping contaminated water to surface or ground water	• Landform has doubtful stability	• Unusable contaminated site that is not adequately managed

5.2 EA holder to nominate indicators

The EA holder is responsible for nominating the indicators for the mining project and should consider the properties of good indicators when doing so. The EM plan submitted with the initial application for a mining tenement is required to list the indicators that are proposed to measure the success of the rehabilitation. The plan must justify why the particular chemical, physical, biological or socio-economic parameter or index has been selected (i.e. identify the implied relationship to a key element of a particular rehabilitation objective listed in the EM plan).

As rehabilitation deals with complex systems, and the relationships between indicators and objectives may not be well understood at the mine planning stage, there needs to be appropriate mechanisms for reviewing the indicators if improved information or more cost effective rehabilitation techniques become available during the life of the mine. If the proposed change to an indicator is to be accompanied by a change in the rehabilitation objectives for a particular domain, an amendment of the environmental authority will be required. If there is likely to be a significant change to the level of environmental impact, the administering authority must require the amendment to be publicly notified.

For all indicators that are selected, the environmental authority holder will:

- state what objective(s) the indicator relates to;
- justify the selection of the indicator, including how the relationship between the indicator and the objective has been established (supported by references to authoritative sources or relevant monitoring data);
- state how the indicator is to be measured;
- state how the results will be reported and interpreted.

5.3 How the administering authority will consider the indicators

A major area of concern for government is the relevance of the indicators to the specific rehabilitation objectives for the mining project, and ultimately to the long term sustainability of the rehabilitation. To ensure that the indicators are relevant, it is recommended that monitoring of the indicators start as soon as possible and continue until the application to surrender the area has been approved by the administering authority (or beyond that time if a site management plan or transitional environmental program is in place). Presentation of a long time series of monitoring data is potentially the most credible way to demonstrate that the risk of rehabilitation failure is low and/or quantifiable. The monitoring will also assist in improving the validity of the completion criteria. Despite the monitoring, there may be some remaining risk that the rehabilitation was inappropriate or will fail and serious environmental harm will occur. Quantification of the cost of this residual risk is addressed in the guideline Calculating Financial Assurance for Mining Projects (EM585).

Examples of possible indicators for a selection of rehabilitation objectives are presented in Appendix A. For land use objectives, the indicators may range from simple quantitative measures of grazing capacity or crop yields to a complex array of indicators that might be needed to establish the viability of a native species ecosystem or its similarity to some analogue / reference site or baseline study. Two recent reviews of the use of indicators show the complexity of this issue at a regional scale and the need to establish the validity of a set of indicators for each specific site (Nichols, 2004; Tongway et al 2003).

6 Completion criteria

6.1 Setting completion criteria

The completion criteria must provide a clear definition of successful rehabilitation for each domain at the mine site in the form of a set of measurable benchmarks against which the rehabilitation indicators can be compared to determine whether the objectives are being met. At least one completion criterion must be developed for each

indicator. Completion criteria should specifically relate to the environmental, social and economic context of the mine site. However, it is possible that some completion criteria may be applied uniformly across a region if supported by technical evidence.

The criteria should be developed in consultation with stakeholders (e.g. the landowner, local government, indigenous groups, community groups and various State departments). The criteria are of importance to landowners because they may set limitations on the agreed future land use and expose the landholder to risks and potential costs associated with maintaining the former mine site in a safe and productive condition.

The applicant is required to propose completion criteria in their EM plan during the application process. If these are based on relevant regional or local studies of successful mine rehabilitation, then the administering authority will include these criteria or modified versions of the proposed criteria in the environmental authority as rehabilitation conditions. The administering authority will require a risk assessment of possible failure modes for the rehabilitation, based on their consequences and probabilities of occurrence. The option to require a cash residual risk payment may defuse some potential debates about what is achievable by making the justification of rehabilitation costs a commercial decision. However, the administering authority may refuse to accept rehabilitation that is clearly not sustainable. Some examples of the type of completion criteria that might be developed are provided in Appendix A.

Note that not all of the indicators and criteria listed in the Appendix would be required for all of the goals at all mines and that specific percentages and other numbers are indicative only.

The quantitative value of a particular criterion may vary significantly from mine to mine or even between domains within a single mine depending on the nature of the disturbance, climate, topography, soil characteristics and other factors. The rehabilitation objectives will guide the selection of the indicators and the specific completion criteria. For example, stability could be reflected in criteria that do not allow erosion of materials from the disturbed areas at rates that exceed natural rates for the locality (and that may range from 1 t/ha/yr in western Queensland to more than 100 t/ha/yr in wet coastal areas). The criterion would be set at an appropriate rate, and in some cases a maintenance program may need to be developed to repair eroded areas, especially if the eroding material is contaminated or the erosion is likely to expose contaminated material.

As another example, if the outcome is to re-establish (as closely as possible) the native ecosystem that was on the mine site there may be an array of vegetation-related criteria. These may emphasise specific species, species diversity, wildlife corridors or fauna re-population. The criteria may require high levels of similarity with baseline studies or reference sites. If the vegetation is of greatest relevance as erosion control, the criteria may focus on canopy foliage cover; ground cover or the biomass developed per unit area. Comparisons with reference sites may be used as an indirect indicator of how sustainable the rehabilitated ecosystem is likely to be. If the vegetation is for aesthetic purposes, a criterion may be the abundance of a nominated species.

If the desired outcome is not related to native vegetation (e.g. the future land use is to be agriculture, grazing, urban development, waste disposal or recreation), native vegetation criteria are likely to have limited, if any, application within the site. Other criteria such as agricultural productivity, chemical and geotechnical stability, and water runoff quality/quantity may become relatively more significant. In some cases certification that a structure is meeting engineering specifications may be appropriate criteria (e.g. for tailings dam walls, waste rock dump slopes, erosion rates or void slope stability).

In areas where suitable rehabilitation information is not available, the applicant may be required to establish a research program. It may benefit the potential applicant to commence this research before an application is made for a mining lease (i.e. while the applicant holds a mineral development licence). As a fallback, this research may occur after an application is made during the preparation of an environmental impact statement. Where neither of these options is possible, the environmental authority must contain criteria based on similar mines or general research and should contain a condition requiring the commencement of on-site trials to verify

or modify these criteria within a relatively short timeframe (e.g. less than two years). The absence of field trials to verify the criteria is not justification for omitting completion criteria from the EM plan.

6.2 Monitoring and changing completion criteria

Once the criteria are established, the environmental authority holder will be expected to collect relevant information to assist the administering authority to make decisions about the adequacy and sustainability of the rehabilitation. Progressive certification of rehabilitation requires the administering authority to make the decision on whether rehabilitation is satisfactory possibly several years before the final rehabilitation application is made. In that time monitoring of the rehabilitation will continue and may disclose inadequacies in the earlier rehabilitation.

The later information does not invalidate the earlier certification unless the rehabilitation ceases to meet the original completion criteria. However, it may be used to reassess the residual risk. If the residual risk payment is likely to increase substantially or there are technical or social reasons for change, the holder may apply to amend the rehabilitation objectives and/or change the indicators or completion criteria.

A similar consultation process should be undertaken if there is a need to change the criteria because of subsequent rehabilitation research, strong community concerns or improved technology. The environmental authority must be amended and the amendment must be publicly notified if it is likely to increase the level of significant environmental harm or a significant change in the impacts on environmental values, including land use capability. If the amendment is granted, the new requirements will be taken into account at final surrender to assess the rehabilitation and to calculate the residual risk.

Monitoring of the indicators for an area of progressive rehabilitation should result in a clarification of issues, minimisation of risks and an increasing certainty in the sustainability of the rehabilitation. Where there is evidence of decreasing potential environmental harm, the monitoring of low risk matters may become unnecessary. However, unless the environmental authority is amended, evidence that the low risk matters are continuing to meet the relevant completion criteria will still be required at the time of surrender.

7 Certification or surrender

7.1 The assessment process

The certification or final sign-off of rehabilitation requires the appropriate application form to be completed and adequate information to be provided by the applicant in a rehabilitation report. This includes evidence that the rehabilitation meets the completion criteria and a risk assessment. The benefits of providing high quality information include expediting the assessment by the administering authority, improving the likelihood of a positive outcome, and minimising any necessary residual risk payment. The administering authority regards the surrender as a very significant decision as it effectively transfers future liabilities at the site from the mining company to the State and in some cases to the landowner. The administering authority will establish a Progressive Rehabilitation Advisory Committee (PRAC) consisting of senior staff members with a range of technical skills relevant to rehabilitation. The PRAC will consider any rehabilitation application for a level 1 mine, and will be available to discuss critical issues with the applicant. The PRAC will have an advisory role and provide recommendations to the decision-making delegate, based on the wide experience of its members and external advisors, if necessary.

The completion criteria are an important component of the certification process and need to be agreed before the application can proceed. The other necessary component is clear and comprehensive information on the performance of the rehabilitation from when it was undertaken until when the application for certification or surrender is made. This information is required in the progressive or final rehabilitation report that must accompany the application for certification or surrender. The guideline Final and Progressive Rehabilitation Reports and Audit Statements for Level 1 Mining Lease Projects (EM610) gives details of the type of information

and detail required. The administering authority may seek advice from landholders, other government departments or technical experts when deciding the application.

To minimise delays in the assessment process, the mining tenement holder should provide this information together with an interpretation of its significance by an appropriately qualified person. The number of measurement sites and the monitoring period will vary due to differences in the size of mines, climate and the complexity of ecosystems being established. Most mine sites are listed on the Environmental Management Register and to be removed from the register they require a site investigation and suitability report. If they remain on the register a site management plan (under s. 401 of the EP Act) must be lodged before or with the final surrender application. It must include the landowners' agreement to the proposed management arrangements for the contamination and be approved by the administering authority.

An audit statement will be required from an appropriately qualified person on behalf of the holder of the environmental authority. A risk assessment must be provided in accordance with the methodology outlined in the guideline Calculating Financial Assurance for Mining Projects (EM585). Before the administering authority issues a certificate for progressive rehabilitation, it will require any residual risk payment to be made. This can be in a bank guarantee with the financial assurance for the mining project. This may be paid in cash or bank guarantee. If the application is for the final surrender of a tenement, the administering authority will require the total residual risk payment to be made in cash, even if it includes amounts that were covered by a bank guarantee when progressive certification was granted for all or part of the area. The administering authority must decide whether the rehabilitation is satisfactory or meets other requirements such as an approved transitional environmental program or site management plan. The administering authority will consider whether the conditions of the environmental authority and any environmental protection policy (EPP) requirements have been met, the final or progressive rehabilitation report, any assessment report on the rehabilitation report, the risk assessment report, the audit statement, any site investigation conducted with regard to the contaminated land provisions of the EP Act and the standard criteria in Schedule 4 of the EP Act.

The rehabilitation will be accepted if the procedures outlined in this guideline demonstrate that it meets the specific objectives set for the mine site in its environmental authority.

7.2 Relationship between completion criteria and residual risk

The completion criteria must be met in order to obtain either certification of progressive rehabilitation or approval of a surrender application (involving final rehabilitation). Some of the criteria may require achieving a nominated value for an indicator for a specified time period. Others may require evidence that the nominated value has been achieved, or is expected to be achieved, on the basis of current trends. The latter is potentially a higher risk option and that would be reflected in the residual risk calculation described below.

Because natural processes and human activities may have adverse effects on rehabilitation, it is possible that a site that meets a criterion at one time may fail to meet the same criterion at some future time. Even if all criteria are met for several years, there is no guarantee that the rehabilitation will not fail in the future. The risk of failure is called the residual risk. The guideline Calculating Financial Assurance for Mining Projects (EM585) indicates how it is calculated through a risk assessment that considers:

- what components of the rehabilitation are most likely to fail (hazards);
- the likelihood of failure;
- the consequences of failure.

For any given set of completion criteria, the cost of rehabilitation will depend to some extent on the length of time that the rehabilitation is designed to meet the criteria. If more costly rehabilitation were undertaken, the risk of failure within a specified time period would generally decrease. This would be reflected in a requirement for a lower residual risk payment. It is a commercial decision for the mining company whether it should design its

rehabilitation to a standard that goes beyond compliance with the environmental authority and be rewarded by a lower residual risk payment.

7.3 Use of the risk assessment in decision making

Risk assessment involves measures of likelihood and consequence of a potentially hazardous event. In order to quantify the risk, both likelihood and consequence need to be estimated quantitatively. That means likelihood will be identified as the probability of rehabilitation failing to meet completion criteria within specific timeframes after certification or approval and consequence will be estimated as the cost of managing the hazardous event. More detail on this process will be included in the guideline Calculating Financial Assurance for Mining Projects (EM585).

The probability of rehabilitation failure will usually be established from estimates of the minimum time before the rehabilitation has a 50 percent probability of failure and the variance of that estimate. In some cases it will be possible to model when a particular structure may fail, or to predict when a final void is likely to overflow on the basis of empirical measurements at the mine. In other cases there may be empirical data from nearby mines or theoretical calculations based on general scientific principles. If relevant scientific data is not available, anecdotal evidence from this or nearby mines may be of some use. However, there will be cases where the only source of information will be the best estimate of people with extensive experience in particular aspects of rehabilitation. A risk assessment based on poor data will have relatively high levels of uncertainty that would be factored into the administering authority decision on whether or not to accept the application.

While estimates of probability of failure would normally assume that the proposed land use will occur, the estimates may not be relevant if the rehabilitated land is used for a purpose other than the specified/agreed use. This needs to be considered where an alternative/more intensive use may occur without constraint. As indicated in Section 2.2, there are few legislative constraints on future land use and most of these (except site management plans and nature refuges) depend on voluntary actions by the land owner.

The consequence of a hazardous event will be estimated as the cost of management if the event happened at the present time. A consequence that does not reach the threshold of material environmental harm, i.e. an actual or potential loss to property or rehabilitation costs of at least $5000 within the first year period, will not be considered in calculations. Because risk is defined as the product of likelihood and consequence, the threshold for consideration will be set at a risk-cost of $5000 per year to provide consistency with material environmental harm.

The first decision the administering authority must make is whether to accept the rehabilitation for certification or approval of surrender. Certification or approval is unlikely to occur unless the likelihood of failure of the rehabilitation to meet the required outcomes over the medium term (e.g. at least 30 years) is expected to have a low probability (e.g. less than 0.01). If there is a higher probability of failure that would exceed the risk-cost threshold in the medium term, the administering authority would generally determine that the risk of failure is unacceptable. However, in some cases the failure would be accepted because the company has proposed a financial scheme to cover ongoing costs, such as a sinking fund. This type of arrangement is only likely to be an appropriate solution if maintenance is required for a short period. See the guideline Calculating Financial Assurance for Mining Projects (EM585). An alternative rehabilitation strategy would be needed if perpetual maintenance (in excess of the maintenance that would normally be required to undertake the proposed land use on un-mined land) is considered necessary to deliver a sustainable outcome.

The second application of the risk assessment is to assist the administering authority in determining whether any residual risk payment will be required and if so, how much will be required. Because these costs are likely to occur at some future time, standard accounting procedures should be used to establish the net present value (NPV) of the consequences. Note that the NPV is not used in calculating the risk-cost of the incident.

8 Dealing with existing mines

8.1 Mines with clear rehabilitation objectives

Historic rehabilitation must be evaluated against the rehabilitation requirements that were in place for the mining project at the time the rehabilitation was completed. This could lead to a matrix of different rehabilitation outcomes within a single domain. For example, over a period of time the species mix may have been changed in response to earlier experience or changing community expectations. The following does not deal with mines operating under Special Agreement Acts (see s.614 of EP Act).

Mines operating prior to September 1990 may have had special lease conditions relating to rehabilitation. Many would have had no specific rehabilitation requirements. Otherwise they may have been subject to rehabilitation conditions applied under s.60(2) of the *Mining Act 1968* or under s.61 of the *Mining Act 1968,* which gave the Minister discretion to require the tenement holder to:

- undertake certain activities if directed by the Minister;
- level the surface and otherwise restore the land to its original condition (as nearly as may be);
- reinstate (as nearly as may be) the natural contours and channel of every watercourse.

The standard wording used typically was even more stringent and required:

- shaping the area so that it conforms as far as reasonably practicable with the surrounding topography;
- reforming all drainage lines, waterways and creek beds to stable contours and as near as reasonably practicable to the situation existing prior to mining;
- achieving a post mining land use capability across the lease area equal with that pre-existing the Lease, where this is technically feasible.

Between 1 September 1990 and 1 May 1995, all mining leases that were current under the *Mineral Resources Act 1989* (MR Act) had a condition that the holder shall undertake rehabilitation to the satisfaction of the Minister for Mines (s.7.33(1)(d)). From June 1992 until 1 January 2001 a Department of Mineral Resources policy, Environmental Management for Mining in Queensland 1992, explained how those requirements were to be defined in an Environmental Management Overview Strategy (EMOS). An amendment to s.276 of the MR Act in May 1995 made the preparation of an EMOS a statutory requirement. Every EMOS that had been accepted or approved (except for mines operating under Special Agreement Acts) were validated by s.585 of the EP Act. Also in 1995, the Minister for Mines and Energy was prevented from accepting the surrender of a mining lease, unless the Minister was satisfied that the holder had satisfactorily rehabilitated the land (s. 309(5) of MR Act).

Rehabilitation completed prior to 2001 would generally not be assessed against the current legislation or the policy position proposed in this guideline. Where rehabilitation was completed prior to the preparation of an accepted EMOS or EM plan, the rehabilitation requirements may have been in:

- the instrument of lease;
- special conditions imposed by the minister at grant, renewal or assignment;
- a direction by the Minister for Mines under s. 309(3) of the MR Act; or
- a decision of the Mining Warden.

Between 1992 and 1996, almost every mining project prepared an EMOS. Most will have identified at least one rehabilitation objective (typically low intensity grazing), but few will have established indicators that can be used to measure the success of the rehabilitation and even fewer will have any specific completion criteria.

Where there is a clear intention for the rehabilitation to achieve a specified objective, the administering authority will consider applications for surrender or progressive certification from the environmental authority holder on the basis of that objective. The application must show how the holder has rehabilitated the site to achieve the objective, and provide evidence to support the success of the rehabilitation. This success must be demonstrated for the four rehabilitation goals described in Section 3.1 above (and any other site specific goals that are appropriate). The application must also be accompanied by an environmental risk assessment consistent with s.266G(2) or s.274(2) of the EP Act.

As the overall rehabilitation objective for these mining projects is likely to be some form of agreed post-mining land use, the environmental authority holder will be expected to demonstrate that the land use has been established and is sustainable. If on-going maintenance needs are likely (above the level that would typically be required for the specified land use in that locality), an explanation of how the holder intends to fund those costs is required.

A site that is unsafe (or is likely to become unsafe because of stability issues) would not be accepted as adequately rehabilitated. Similarly a site that is causing, or likely to cause, material or serious environmental harm (e.g. water pollution) would not be accepted as being successfully rehabilitated. If an environmental risk assessment shows that the risk cost of the rehabilitation failure exceeds the threshold set by the administering authority (currently $5000), the applicant will be required to nominate an appropriate amount as the residual risk payment. A site that is likely to require on-going maintenance would not normally be accepted without a fully funded maintenance program.

8.2 Mines without clear rehabilitation objectives

The rehabilitation requirements that applied at the time the rehabilitation was completed will be considered. However, if those requirements do not clearly define rehabilitation objectives, the environmental authority holder should apply to amend the environmental authority to define rehabilitation objectives, indicators and completion criteria for the site that are consistent with the four rehabilitation goals described in Section 3.1 above. Public notice of this application will be required and public objection rights will apply to any new rehabilitation objectives and any associated amendments that are likely to cause a significant increase in environmental harm. Approval of any amendment application will be required before an application for surrender or progressive certification of rehabilitated areas can be decided. An application that provides a strategy to ensure that the proposed future land use will be adopted would reduce some of the uncertainty that may delay decision making.

An environmental risk assessment and residual risk calculations must also be included with the application. If the rehabilitation meets the rehabilitation requirements that were in place at the time the rehabilitation was completed and there is an acceptably low risk of environmental harm occurring from the site, a certification application should be accepted. Acceptance of a surrender application may require lodgement of an appropriate residual risk payment.

Appendix A – Examples of possible rehabilitation objectives, indicators and completion criteria

REHABILITATION GOAL	POSSIBLE REHABILITATION OBJECTIVES	POSSIBLE INDICATORS	NATURE OF COMPLETION CRITERIA
Long-term safety	Site is safe for humans and animals now and in the foreseeable future	• Safety assessment of openings	• Certification in rehabilitation report that openings are now safe and will remain so
		• Safety assessment of slopes that are >30° and >5m in height	• Certification in rehabilitation report that slopes are safe and predictions about future safety
		• Exposure to and availability of heavy metals and other toxic materials (selected because of relevance to site)	• Certification in rehabilitation report that specified cover thickness (and/or other specific criteria) is in place and predictions about future changes • Evidence in rehabilitation report that dust monitoring results have complied, and will continue to comply, with limits (derived from EPP Air or other agreed reference source)
			• Evidence in rehabilitation report that measures required in site investigation report have been implemented • Leaching tests of exposed material meet specified guideline values (using standard protocols such as US EPA Toxic Characteristic Leaching Procedure) • Evidence that monitoring surface water quality for [X] years has complied with specified guideline values (derived from ANZECC 2000 or agreed reference source) • Site management plan to include measures for fire reduction and to control woody weeds
		• Adequacy and predicted long-term performance of safety barriers	• Evidence in rehabilitation report that adequate safety plan has been implemented
Non-polluting	Hazardous material adequately managed	• Technical design of capping	• Engineers certification of construction and maintenance to design performance stated in environmental authority or EM plan
			• Evidence that X years monitoring data demonstrates that capping is

REHABILITATION GOAL	POSSIBLE REHABILITATION OBJECTIVES	POSSIBLE INDICATORS	NATURE OF COMPLETION CRITERIA
			functioning according to environmental authority
		• Results of site investigation report	• Removed from Environmental Management Register or Adequate funds to implement approved site management plan
	Acid mine drainage will not cause serious environmental harm	• Technical design of barriers	• Engineers certification of construction and maintenance to specified design performance
	(a) by excluding water and/or air from sulphides		
	Or	• Hydrostatic head / temperature in waste rock piles	• Certification that monitoring data show no unexpected rise of water levels or temperature
	(b) by implementing a treatment system to remove acidity	• Downstream surface/groundwater monitoring	• Certification in rehabilitation report that water neutralisation system is meeting and will continue to meet design requirements
	Polluted water contained on site	• Downstream surface/groundwater monitoring	• Certification that water diversion/containment structures to minimise quantities of polluted water and containing it on site are effective • Certification that monitoring data meet specified criteria relevant to potential contaminants
Stable	Very low probability of subsidence or rock falls with serious consequences (link to environmental harm?)	• Geotechnical studies of existing structures, underground workings, high walls or voids	• Evidence in rehabilitation report that appropriate risk assessment has been undertaken and control measures are in place
		• Past record of subsidence or rock falls in this mine	• Evidence in rehabilitation report that appropriate control measures are in place to prevent recurrence
	Very low probability of slope slippage with serious consequences (link to environmental harm?)	• Geotechnical, geochemical and hydrological studies of existing structures (outer batter slopes of waste rock dumps & tailings storage facilities)	• Evidence in rehabilitation report that appropriate risk assessment has been undertaken and control measures are in place that will continue to meet agreed requirements

REHABILITATION GOAL	POSSIBLE REHABILITATION OBJECTIVES	POSSIBLE INDICATORS	NATURE OF COMPLETION CRITERIA
		• Past record of slope failure in this mine	• Evidence in rehabilitation report that appropriate control measures are in place to prevent recurrence
	Landform design achieves appropriate erosion rates	• Slope angle and length	• Slopes <12o (or other value determined for particular waste material and climate)
		• Engineered structures to control water flow	• Evidence in rehabilitation report that required contour banks, channel linings, surface armour, engineered drop structures, etc are in place and functioning
		• Rate of “soil” loss	• Evidence in rehabilitation report that measured erosion rates meet limits set from reference sites, regional studies or by agreement (e.g. derived from in situ trials or calculated from Universal Soil Loss Equation or similar agreed method)
	Vegetation cover to minimise erosion	• Vegetation type and density	• Evidence that the vegetation type and density are of species suited to the spoil/waste composition, slope, aspect, climate and other factors, and that the measured erosion rates meet the limits set (only relevant to stability where root systems are a major control of erosion).
		• Foliage cover	• Evidence that the percent cover meets the set values based on the regional assessment of cover requirements (Note: Values in excess of 70% are typically needed to protect surface soils from rain-induced erosion. In arid areas achievable values are likely to be much lower (perhaps less than 50%) and in high rainfall areas the values may be higher).
		• Leaf litter, humus, depth of growing medium	• Evidence that nutrient cycling is occurring and the presence of leaf litter is assisting in limiting erosion of the soil/spoil surface.

REHABILITATION GOAL	POSSIBLE REHABILITATION OBJECTIVES	POSSIBLE INDICATORS	NATURE OF COMPLETION CRITERIA
Sustainable land use	Soil properties that support and will continue to support desired land use (The soil indicators are less likely to be used for completion criteria than as planning tools to improve chances of other outcomes being achieved)	• Chemical properties (e.g. pH, salinity, nutrients, trace elements) of topsoil and in soil profiles that are within range of roots of proposed vegetation	• pH in range 5.0 to 8.5 (narrower range if necessary to achieve specific outcomes or broader range depending on local conditions) • Salinity < 0.2% chloride (lower levels if necessary to achieve particular outcome or broader range depending on local conditions). • Evidence that highly saline material should not be used as surface cover or potential growth medium
		• Physical properties (e.g. depth of top soil, water infiltration, crusting, slope)	Limits set from reference sites, regional studies or agreed conditions (e.g. derived from trials)
		• Biological properties (e.g. nutrient cycling, microbial biomass, invertebrates)	• (Completion criteria for such indicators may require site trials because they will be specific to the site)
	Establish specified self sustaining natural vegetation or habitat	• Presence of key species • Species type and diversity • Abundance of weeds	• Certification that key species are present • Certification that species diversity achieved • Certification that weed management successful
	Establish specified water body with low risk of environmental harm	• Hydrological studies to establish water levels and connectivity • Water quality established by monitoring or modelling validated by monitoring • Structural report on integrity of structure	• Certification that water body will not overflow in 1:100 ARI event (or less frequent event if containing hazardous material) • Monitoring specified contaminants (e.g. pH, As, cyanide) for X years • Meets specified water quality guidelines • Hydrologists report • Engineers certification of structure
	Establish land use with comparable management requirements to similarly used non-mined land.	• Crop productivity • Achieve agreed capability distribution	• Meets specified yield (e.g 90% of unmined land or 20% of unmined land)

Appendix B – Definitions

Term	Definition
Appropriately qualified person	The person or persons should have qualifications and/or experience that are relevant to aspects of the rehabilitation so they can give an authoritative assessment of the performance of that aspect of the rehabilitation, especially in relation to the completion criteria.
Completion criteria	These are the standards that are to be met by successful rehabilitation. They will generally be in the form of numerical values that can be verified by measurement of the indicators selected for the rehabilitation objectives. They may include an element based on time, e.g. the criterion has been achieved for 7 consecutive years for 95 percent of the area.
Consultation	The act of providing information or advice for, and seeking responses to, an actual or proposed event, activity or process.
Domain	Land management units within a mine site, usually with similar geophysical characteristics. Some examples of typical domains include: • Mine pit • Waste rock piles • Tailings dam • Infrastructure area Within domains, elements may be designated where different rehabilitation techniques and/or timing of work is required, e.g. an access road
EA	Environmental authority
EM plan	Environmental management plan
Environmental hazards	These are chemical, physical or biological changes that may cause environmental harm to one or more environmental values.
Goals	These are the policy objectives for rehabilitation that are set (often informally) by Government.
Indicator	An indicator is something that can be measured and audited according to an established protocol and used to evaluate changes in a system.
Land capability class	Classification of the capacity of land to achieve and sustain specified land uses. Class I land is capable of supporting most agricultural and grazing activities whilst class VIII land imposes severe limitations on agricultural or grazing uses. “Average” management inputs are assumed.
Objectives	The end points that rehabilitation aims to achieve. They may be described

Term	Definition
	in terms of future land use, biodiversity values, conservation values, health and safety outcomes, aesthetics or social outcomes or combinations of these.
Rehabilitation	Rehabilitation is the process of making a former mine site safe, stable and self-sustaining. Note: This usage is far broader than rehabilitation's literal meaning of re-establishing former condition or effectiveness. While it may be appropriate to attempt to restore the pre-mining conditions after mining has ceased for some smaller mines and mines in areas with special values, this may not be possible or an optimum result across mine sites particularly in specific domains.
Residual risk	Residual risk is defined in schedule 4 of the EP Act to include the risk that: • apparently satisfactory rehabilitation will fail in the foreseeable future and require repair, replacement or maintenance; • the area will need ongoing management; or • contaminants will be released and potentially cause environmental harm that requires monitoring or management.
Stable	Resistant to change in landform, pollution generation or land use potential to an extent that is similar to unmined land in the locality. The acceptable rates of change of specified parameters or the maximum risk of specified environmental harm may be set in an environmental authority.
Stakeholder	A person or organisation that is potentially affected by a decision, such as a resident, land owner, community group, government agency, company, traditional owner, or environmental group.
Suitably qualified person	A person whose professional training or experience is relevant to the matter being considered.

Appendix C. Preliminary Gap Analysis

Tick Hill Mine Closure Checklist: Contaminated Land

Stage	Stage Objectives	Key Documents	Key Stakeholders Discussions		Evidence of Works/Reports/Discussions
Closure Planning	· Identification of contamination source types and areas including development of a mine site contaminated sites register · Investigation of sites on contaminated sites register to assess and delineate soil (and potentially) groundwater contamination · Meet with the client and key stakeholders to identify remedial works expected to be required to achieve the post mining land use based on identified contamination. · For contamination expected to exceed guidelines post remediation, undertake a site-specific risk assessment to determine site-specific remedial targets · Agree on remedial targets with key stakeholders (including future land users and the regulator) including obtaining site-specific advice where required · Submission of a draft Remediation Plan including Remedial targets for stakeholder comment · Finalisation of Remediation Plan and inclusion into the Site Closure Plan	Stage 1 Site History Investigation Stage 2 Closure Assessment - contaminated sites Risk Assessment for derivation of remedial targets Remediation Plan/Remediation options study Independent auditor report (if used) Groundwater monitoring events Statutory declaration by SQP for relevant reports	Future land use agreement (regulator/future owner) Remediation options agreement (regulator) Remediation targets to support future land use (regulator)		No information in regards to former locations of contaminating activities (including potential contaminants on file) i.e. no site history. No closure assessments on file. A closure plan was prepared by Dames and Moore in 1993/1994. This plan has been lost. Amendments to the plan in regards to rehabilitation of some areas i.e. tailings dam are on file. Approval by DPI of D&M tailings dam closure plan on file. No agreement of remediation targets on file. No statutory declaration from a SQP on file. No evidence of use of an independent auditor.
Closure	· Implementation of Remediation Plan · On-going dialogue with key stakeholders · Revisions to remediation plan as required · Audit of remediated areas · Integration of remedial and contamination works with engineering and capping works where possible to maximise efficiencies · Summary of remedial works in a Remediation Report	Progressive closure reports Risk Assessment for further derivation of remedial targets (if required) Remediation Report Independent auditor report (if used) Statutory declaration by SQP for relevant reports	Any modifications to remedial targets/closure plan (regulator/future owner)		No evidence of works being undertaken in accordance with the closure plan i.e. No closure/decommissioning report on file. No statutory declaration from a SQP on file. Agreement from future lessee on assets to remain on file.
Post Closure	· Finalisation and implementation of Management Plans for areas requiring on-going management · Implementation of Management Plans including on-going monitoring and regular inspections. · Independent audits · Submission of key reports to stakeholders	Management Plan (on-going site use) Post closure monitoring Post closure audits Statutory declaration by SQP for relevant reports	On-going discussions with regulator Discussions with future owner (if required)		Audits undertaken by regulator on file. Audits appear to be compliance/H&S orientated - unsure what the purpose of these audits was besides compliance with current authority Monitoring/assessment undertaken in 2012 by Xstrata. Soil sampling locations unknown as well as the purpose of this monitoring/assessment. Groundwater monitoring data - unsure of relevance, spatial distribution, analytes, how the data relates to groundwater - void models No statutory declaration from a SQP on file

Tick Hill Mine Closure Checklist: Ground Water

Stage	Key Information Required	Evidence of Works	Key Gaps Identified	Works Suggested
Closure Planning	Determine the spatial distribution and temporal variations of groundwater levels across the site, including within the underground workings, to identify any impacts from the void, tailings dam and decant pond	2 monitoring bores with sporadic groundwater level data	The number of groundwater monitoring bores and data collected are insufficient Due to the impermeable nature of the host rock and the faulting across the site, groundwater flow is likely to be structurally controlled with flow occurring almost exclusively along the faults and associated fractures. To assess the potential impact of mining activities and site infrastructure, the groundwater in these structural features should be examined. The locations of any future monitoring bores must therefore target these structural features, to adequately characterise the groundwater levels across the site.	Expand the current monitoring bore network to define the spatial distribution and temporal variations of groundwater levels, and collect additional data, including within the structural features
	Determine the spatial distribution and temporal variations of groundwater quality across the site, including within the underground workings, to identify any impacts from the void, tailings dam and decant pond	2 monitoring bores with sporadic groundwater quality data	The number of groundwater monitoring bores and data collected are insufficient The higher pH values in July 2004 may be indicative of a faulty electronic meter. Bore purge sheets from 2012 have a discrepancy between the pumping rate, pumping duration and total volume purged. Due to the impermeable nature of the host rock and the faulting across the site, groundwater flow is likely to be structurally controlled with flow occurring almost exclusively along the faults and associated fractures. To assess the potential impact of mining activities and site infrastructure, the groundwater in these structural features should be examined. The locations of any future monitoring bores must therefore target these structural features, to adequately characterise the groundwater levels across the site.	Expand the current monitoring bore network to define the spatial distribution and temporal variations of groundwater quality, and collect additional data, including within the structural features Review sampling protocols and follow a suitable groundwater sampling guideline such as Geoscience Australia 2009.
	Define the lower and upper background limits for hydrochemical parameters		Lower and Upper Background limits of groundwater quality parameters	Review groundwater quality data to establish lower and upper background limits for relevant parameters, to enable future
	Determine the aquifer properties		Aquifer properties	Conduct slug or pumping tests in bores to determine the aquifer properties hydraulic conductivity and storativity
	Develop a conceptual hydrogeological model, including the influence of structural features on		Conceptual Hydrogeological Model	Collate and synthesise all hydrogeological data to develop a conceptual hydrogeological model, enabling the interactions
	Prepare a current site water balance		Numerical groundwater flow model	Based on conceptual model, incorporate rainfall, runoff and groundwater data to prepare a site water balance through
	Examine the changes to groundwater hydrochemistry		Analytical model	Based on conceptual and numerical model, assess changes to groundwater hydrochemistry through analytical modelling
Post Closure	Expanded groundwater monitoring network and ongoing monitoring program for groundwater levels and quality			

Tick Hill Mine Closure Checklist: Geotechnical

Summary

The global stability of the waste rock dump, tailings dam and decant pond seem fine. There were no signs of instability (bulging toe, slumping, tension cracks on or behind the crest). This important point can be

Waste rock dump

Scour/erosion is currently a minor issue. Technically, DEHP can instruct XMIM to rectify this issue on the waste rock dump since the 1999 Plan of Operations clearly shows a contour profile in which all water on top of the waste rock dump will drain towards the channel which exits in the SW corner (I presume that's the same as the referenced Figure 3.1 from the 1994 Plan). There are 3 erosion/scour gullies in the northern batter which means the water does not drain as per the plan. One is 0.5 m to 1.0 m deep. That is

Potential solutions are to:

- Do the same as what was done in the SE corner and southern batters (i.e. fill void with dumped rock and build up a small bund at the crest to prevent water from flowing over and scouring the batter), or
- Line the scouring and vegetate as shown in:
  - http://www.maccaferri-

The drainage path / creek near the toe of the western batter is scouring over time. The western creek bank is at 1V:1.5H and the eastern creek bank is subvertical and approximately 1 m high. Whilst it will present an issue at some stage to the stability of the eastern face of the creek bank at some point, it should not affect

Tailings dam

It appears to be performing as planned.

Decant pond

The batters are stable and the drainage path of the surface water appears to be in general accordance with the 1999 Plan of Operations Figures. Global stability is fine.

The only potential issue from DEHP is two scoured channels on the western batter. They are located approximately half way along the length of the western batter and are approximately 0.5 m deep and 1 m wide. It shows that flows tend to concentrate here.

I think the best solution would be to line these channels with Biomac (reference above) or similar and vegetate to greatly reduce / stop further scour.

Tick Hill Mine Closure Checklist: Ecology

Terrestrial ecology component is OK.

The DEHP may want data from sometime in between 2012 and 1999 but we should be able to discuss/negotiate this with 2012 dry and wet season data.

Tick Hill Mine Closure Checklist: Soils / Landform

Landform component is OK.

The DEHP may want data from sometime in between 2012 and 1999 but we should be able to discuss/negotiate this with 2012 dry and wet season data.

Soils appears OK at this point. There may be some minor works required, but generally this could be incorporated into future Contam Lands/ground Water works, so would unlikely be a stand-alone cost.

Appendix D. Field Data Summary – Flora

Plant frequency per 10m^2

	August 1999	October 2012
Survey location	Mean (Std. Dev.)	Mean (Std. Dev.)
Colluvial slope	89.3 (48.7)	64.3 (17.6)
Plains	238.7 (21.4)	105.3 (42.7)
Rock dump	82.0 (21.9)	26.3 (12.1)
Mine infrastructure area	No data	44 (7.8)
Tailings dams	69.0 (72.2)	25 (6.1)

Appendix E. Benchmark Data for RE1.11.3

BioCondition Benchmarks for Regional Ecosystem Condition Assessment

Benchmarks are quantitative values derived from reference sites for each condition attribute assessed in BioCondition, and are used as a reference value for comparison purposes. Benchmarks have been developed from information published by the State of Queensland (acting through the Department of Environment and Resource Management, the Department of Employment, Economic Development and Innovation and the Commonwealth Scientific and Industrial Research Organization). They have been developed primarily to be used with the condition assessment tools, BioCondition (Eyre *et al.* 2011), the Delbessie Agreement Guidelines for Determining Lease Land Condition (State of Queensland, Department of Environment and Resource Management 2009), the Queensland Biodiversity Offset policy and the Vegetation Management Offset policy. Benchmarks are subject to regular review based on additional data and expert opinion.

The benchmarks are compiled using site survey data from the Queensland Herbarium's CORVEG database and quantitative site data from reference sites and are summarized to provide information specific to each regional ecosystem vegetation community. BioCondition benchmarks aim to reflect the natural variability in structure and floristic composition under a range of climatic and natural disturbance regimes throughout the geographic extent of a RE. Local reference sites should be assessed where possible to account for this spatial and temporal (seasonal and annual) variability.When conducting BioCondition assessments, the technical descriptions, if available, should be used in conjunction with the benchmarks and the regional ecosystem description database (REDD) for the specific regional ecosystem.

In rangeland ecosystems, seasonal conditions can account for wide variation in the values obtained for some attributes assessed in BioCondition. Therefore in these ecosystems a range is expressed instead of a single benchmark value. When using rangeland regional ecosystem benchmarks to assess condition, the lower value of the benchmark range can be used as the benchmark, or if assessing a site under good seasonal conditions then use of the average value as the benchmark.

Definitions

Attribute	Brief description
Recruitment of dominant canopy species	Proportion of the dominant canopy (ecologically dominant layer) species with evidence of recruitment.
Native plant species richness	The number of species expected in four life form groups, i.e. tree, shrub, grass, forbs and other species
Tree strata: • Canopy • Sub-canopy • Large trees	• *Height* – median height in metres • *Cover* - percentage cover (assessed as opaque crowns) • *DBH (Diameter at Breast Height)* – For large trees only; dbh threshold (cm). • *Typical tree species for benchmark sites*
Shrub strata: • Native shrub cover	• *Cover* - percentage cover (assessed as opaque crowns) • *Typical shrub species*
Ground cover: • Native perennial grass cover • Litter cover	• *Cover* – percentage cover (assessed as projected foliage cover) • *Typical ground cover species*
Coarse woody debris	• Total length in metres of woody debris > 10 cm diameter and > 0.5 m per hectare
Non-native plant cover	• *Cover* – The percentage cover of non-native plants • *Typical non-native species* listed with common names and declared pest status[1]

Conditions of use

BioCondition benchmarks have been developed from information published by the State of Queensland (acting through the Department of Science, Information Technology, Innovation and the Arts) and remain the property of the State of Queensland. BioCondition benchmarks are not to be included on internet sites other than the departmental website.

Users should reference information contained in the BioCondition benchmarks as: Queensland Herbarium (year*) BioCondition benchmarks of Regional Ecosystems, (month, year*) (Department of Science, Information Technology, Innovation and the Arts: Brisbane). * Date shown in footnote of individual descriptions.

While every effort has been made to ensure the information presented is as reliable as possible, the State of Queensland accepts no liability and gives no assurance in respect of its accuracy and shall not be liable for any loss or damage arising from its use. BioCondition benchmarks are based on a combination of quantitative and qualitative information and should be used as a guide only. BioCondition benchmarks are subject to review and are updated as additional data becomes available.

For more information, contact:

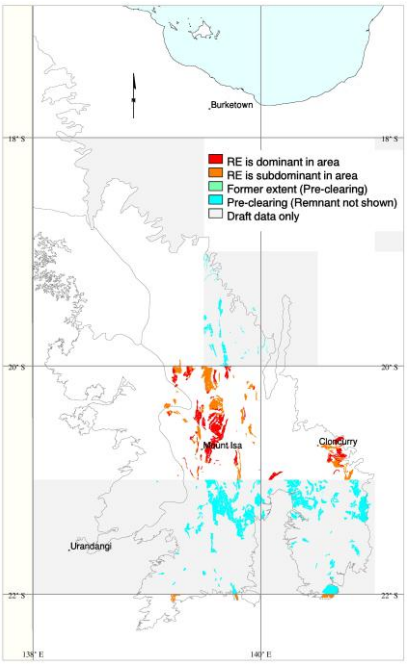
Annie Kelly, Queensland Herbarium, Science Delivery, DSITIA
Brisbane Botanic Gardens (Mt Coot-tha), Mt Coot-tha Road, Toowong QLD 4066

[1] **Declared**—either:
a) a plant or animal species listed in Schedule 2 of the Land Protection (Pest and Stock Route Management) Regulation 2003; or b) an exotic plant that is listed in a local government pest management plan.

BioCondition benchmark for regional ecosystem condition assessment

Northwest Highlands — Regional ecosystem: 1.11.3

Corymbia terminalis low open-woodland on basic metamorphics



Dan Kelman

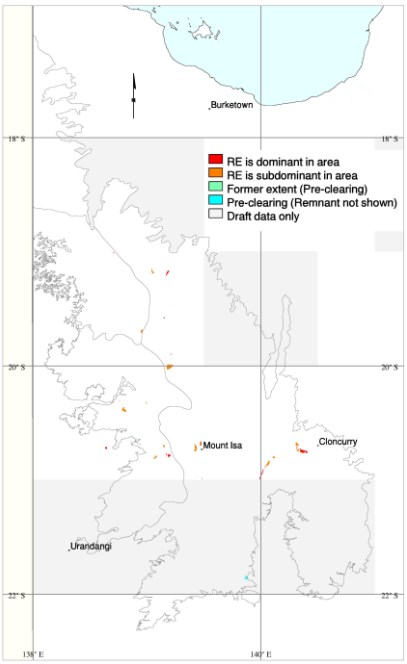
BioCondition attribute			Benchmark
Recruitment of dominant canopy species (%):			100
Native plant species richness:		Tree:	1-9
		Shrub:	1-14
		Grass:	2-11
		Forbs and other:	4-20
Trees:	Tree canopy	Tree canopy median height (m):	3-10
		Tree canopy cover (%):	2-29
	Tree sub-canopy	Tree sub-canopy median height (m):	na
		Tree sub-canopy cover (%):	na
	Large trees	Large eucalypt tree dbh threshold (cm):	30
		Number of large eucalypt trees per hectare:	no data
		Large non-eucalypt tree dbh threshold (cm):	20
		Number of large non-eucalypt trees per hectare:	no data
Shrubs:		Native shrub cover (%):	0-85
Ground cover (%):		Native perennial grass cover (%):	10-91
		Organic litter cover (%):	0-20
Coarse woody debris: Total length (m) of debris ≥ 10cm diameter and ≥0.5m in length per hectare:			no data
Non-native plant cover			0
None listed			

Selected typical species are those that characterize the ecosystem, community or stratum at reference sites. Up to five frequently occurring species for each stratum are selected. Users should refer to the regional ecosystem description database (REDD) and/or the technical description for more complete lists of characteristic species. Only the most frequently used common name is given. Other common names may be used in other regions. Declared pest species in Queensland are designated (^).

BioCondition benchmark for regional ecosystem condition assessment

Northwest Highlands — Regional ecosystem: 1.11.3x1

Eucalyptus leucophylla low open-woodland on hills



BioCondition attribute			Benchmark
Recruitment of dominant canopy species (%):			100
Native plant species richness:		Tree:	1-4
		Shrub:	6-7
		Grass:	2
		Forbs and other:	6
Trees:	Tree canopy	Tree canopy median height (m):	5-6
		Tree canopy cover (%):	2
	Tree sub-canopy	Tree sub-canopy median height (m):	na
		Tree sub-canopy cover (%):	na
	Large trees	Large eucalypt tree dbh threshold (cm):	30
		Number of large eucalypt trees per hectare:	no data
		Large non-eucalypt tree dbh threshold (cm):	20
		Number of large non-eucalypt trees per hectare:	no data
Shrubs:		Native shrub cover (%):	1.5
Ground cover (%):		Native perennial grass cover (%):	45
		Organic litter cover (%):	2
Coarse woody debris: Total length (m) of debris ≥ 10cm diameter and ≥0.5m in length per hectare:			no data
Non-native plant cover			0
None listed			

Selected typical species are those that characterize the ecosystem, community or stratum at reference sites. Up to five frequently occurring species for each stratum are selected. Users should refer to the regional ecosystem description database (REDD) and/or the technical description for more complete lists of characteristic species. Appendix H. Contaminated Land Checklist for Process to Closure

Tick Hill Mine Closure Checklist: Contaminated Land

Stage	Stage Objectives	Key Documents	Key Stakeholders Discussions		Evidence of Works/Reports/Discussions
Closure Planning	· Identification of contamination source types and areas including development of a minesite contaminated sites register · Investigation of sites on contaminated sites register to assess and delineate soil (and potentially) groundwater contamination · Client and key stakeholders to identify (and agree to) remedial works expected to be required to achieve the post mining land use based on identified contamination. · For contamination expected to exceed guidelines post remediation, undertake a site-specific risk assessment to determine site-specific remedial targets · Agree on remedial targets with key stakeholders (including future land users and the regulator) including obtaining site-specific advice where required · Submission of a draft Remediation Plan including remedial targets for stakeholder comment · Finalisation of Remediation Plan and inclusion into the Site Closure Plan	Stage 1 Site History Investigation Stage 2 Closure Assessment - contaminated sites Supporting investigations, hydrogeology, hydrology, limnology, water and salt balance models Risk Assessment for derivation of remedial targets Remediation Plan/Remediation options study Independent auditor report (if used) Groundwater monitoring events Statutory declaration by SQP for relevant reports	Future land use agreement (regulator/future owner) Remediation options agreement (regulator) Remediation targets to support future land use (regulator)		No information in regards to former locations of contaminating activities (including potential contaminants on file) i.e. no site history. No closure assessments on file. A closure plan was prepared by Dames and Moore in 1993/1994. This plan has been lost. Amendments to the plan in regards to rehabilitation of some areas i.e. tailings dam are on file. Approval by DPI of D&M tailings dam closure plan on file. No agreement of remediation targets on file. No statutory declaration from a SQP on file. No evidence of use of an independent auditor.
Closure	· Implementation of Remediation Plan · On-going dialogue with key stakeholders · Revisions to Remediation Plan as required · Audit of remediated areas · Integration of remedial and contamination works with engineering and capping works where posisble to maximise effeciencies · Summary of remedial works in a Remediation Report	Stage 1 Site History Investigation Stage 2 Closure Assessment - contaminated sites Risk Assessment for derivation of remedial targets Remediation Plan/Remediation options study Independent auditor report (if used) Groundwater monitoring events Statutory d	Any modifications to remedial targets/closure plan (regulator/future owner)		No evidence of works being undertaken in accordance with the closure plan i.e. No closure/decommissioning report on file. No statutory declaration from a SQP on file. Agreement from future lessee on assets to remain on file.
Post Closure	· Finalisation and implementation of Management Plans for areas requiring on-going management · Implementation of Management Plans including on-going monitoring and regular inspections. · Independent audits · Submission of key reports to stakeholders	Management Plan (on-going site use) Post closure monitoring Post closure audits Statutory declaration by SQP for relevant reports	On-going discussions with regulator Discussions with future owner (if required)		Audits undertaken by regulator on file. Audits appear to be compliance/H&S orientated - unsure what the purpose of these audits was besides compliance with current authority Monitoring/assessment undertaken in 2012 by Xstrata. Soil sampling locations unknown as well as the purpose of this monitoring/assessment. Groundwater monitoring data - unsure of relevance, spatial distribution, analytes, how the data relates to groundwater - void models No statutory declaration from a SQP on file

Introduction

Purpose

This Community Consultation Plan and Register has been prepared to document Carnaby Resources Limited. (CNB) strategy and process for engaging and collaborating with stakeholders on rehabilitation and closure aspects and outcomes, as well as detailing the consultation undertaken prior to and during the development of the Progressive Rehabilitation and Closure Plan (PRCP).

Scope

This document outlines the current community consultation process at Tick Hill Gold Mine (THGM) including stakeholder identification, stakeholder consultation type (details of how and when stakeholder will be engaged), engagement objectives, what information will be provided for community consultation as well as historical issues raised and will document the process by which feedback will be considered by THGM.

It applies to all landholdings under the THGM ownership or management within mining leases 7097, 7094, 7096.

Objectives for Community Consultation

Through the community consultation process, THGM will achieve the following objectives:

- Discuss Post Mining Land Uses (PMLUs) with Stakeholders, to ensure end users are satisfied with the outcome.
- Notify and engage the community regarding rehabilitation and closure of THGM;
- Provide ongoing community consultation throughout the mine life cycle to ensure progressive rehabilitation, socio-economic and environmental impacts related to mine closure are communicated and understood;
- Collaborate with the community to identify rehabilitation and closure opportunities and constraints that could influence effectiveness of final land outcomes; and
- Provide a platform for comments and feedback mechanism to ensure closure and rehabilitation goals and expectations are effectively communicated and addressed.

Context to Community

THGM is located in a remote location, 40 km south of Duchess and 140 km southeast of Mount Isa. THGM has a modest history of engaging directly with the landowners and surrounding businesses. As part of the PRCP process, THGM plans to develop a strategy by which rehabilitated land will be transitioned back into sustained grazing land for the landowners.

Community Profile

THGM is located within the Cloncurry Regional Council (hereafter referred to as "the region" unless otherwise stated), over 100km south west of Cloncurry, in North West Queensland. THGM is remotely located, with no towns, villages or residences/homesteads located nearby (within 5 km).The region is a significant contributor to the North West Queensland economy, where by mining and minerals processing is the central source of employment.

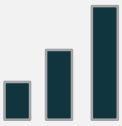
In June 2021, the estimated resident population of Cloncurry Regional Council area was 3,644 with a steady decline in population from 2021 being 4,797 (ABS, Cloncurry 2023). The median age was 34 years in 2021. In 2021 mining was the largest employer in the region, followed by agriculture (beef cattle farming) (ABS, Cloncurry 2023).

THGM is a formaly open-cut and underground operation, managed by CNB. During its operations in the early 1991 - 1995, there have been direct and indirect employment opportunities through suppliers, contractors, service providers and local business.

Stakeholder Identification and Categorisation

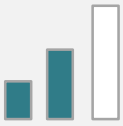
The key focus of community engagement for the PRCP is the directly affected landowners in the vicinity of the mining operation, other effected groups include traditional owners, local government, and local businesses as detailed in Table 1. Engagement on rehabilitation, closure and post-mining land use(s) has occurred to derived the PMLUs, and ongoing consultation as detailed in this plan will be undertaken to confirm suitability as the site is progressively rehabilitated and moves into closure.

For the purpose of consultation frequency, key stakeholder groups for THGM have been categorised into tiers according to their level of impact and engagement.



Key

High and/or frequent level of impact, influence or interest in site activities or decisions



Minor

Medium/semi-frequent level of impact, influence or interest in site activities

Other

Low or infrequent level of impact, influence or interest in site activities or decisions

Table 1 Stakeholder Identification and Categorisation

Category	Identification	Level of impact and engagement
Landholders M.D.H Pty Ltd	Stanbroke Station	**Key**
	Chatsworth Station	**Key**
Community	Duchess	Other
	Dajarra	Other
	The Monument	Other
	Cloncurry	Other
	Mt Isa	Other
Business operators and employees in the locality	Duchess Hotel	**Minor**
	Camps/caravan parks	Other
	Schools/daycare	Other
	Hospitality (restaurants, pubs, bars)	Other
	General stores and markets.	Other
Cultural Heritage	Yulluna People	**Minor**
	Kalkadoon Tribal Council	Other
	Kalkadunga Association in Mt Isa	Other
Government	Local including: Cloncurry Mayor – Greg Campbell	Other
	State and other including: ▪ Department of Environment and Science ▪ Department of Regional Development, Manufacturing and Water ▪ Department of Resources ▪ Department Seniors, Disability Services and Aboriginal and Torres Strait Islander Partnerships ▪ Department of Children, Youth Justice and Multicultural Affairs ▪ Department of State Development, Infrastructure, Local Government and Planning ▪ Department of Transport and Main Roads	Other

Engagement Method

Landholders M.D.H Pty Ltd

The identified key stakeholders are MDH Pty Ltd (MDH) being Stanbroke Station to the West and Chatsworth Station to the East. CNB has an agreement in place, the latest being from the 13th of October 2021. MDH is the lessee of the pastoral development holding no 13/5398 (known as Stanbroke Holding) and pastoral development holding no 13/345 (known as Chatsworth Holding) issued under the *Land Act 1962*. Prior to the mining leases being relinquished CNB must adhere to the agreement. The agreement states such items as: 'not interfere with any fences on the Lease without the company's prior consent,' and statements regarding environmental harm and having controls in place, division and access of water and the maintenance of the water pipeline. Communication between both parties has been face to face in a cooperative manner.

Community

As THGM is remotely located and has ceased mining from 1995 to 2020, communication to community members, and groups remains minor.

Business operators and employees in the locality

During mining between 1991 to 1995 employees were accommodated in the Monument township which was leased from Western Mining Corporation. During the exploration period and recent tailing reprocessing, employees have remained in small numbers and been accommodated in local hotels such as the Duchess Hotel. As employment numbers have remained low and irregular over the years, the communication to local businesses has been minor, and will be contacted when services are required for small working groups.

Cultural Heritage

The native title belongs to the Yulluna People. In March 1990, an archaeological survey was conducted on Tick Hill's mining leases by Brayshaw McDonald Pty Ltd. The sites identified during the investigation were all low archaeological/heritage significance, in that artefacts were sparsely distributed, few, non-diagnostic and in un-stratified contexts. The prepared report was forwarded to the Department of Heritage and Environment, Queensland National Parks and Wildlife Service and a copy of the survey results were sent to the Kalkadoon Tribal Council and the Kalkadunga Association in Mount Isa (Envirofin, 2020). The communication with cultural heritage groups has been minor.

Government

Government representatives were included at the Federal, State and Local level. Key agencies of relevance to the area included police, emergency services, drug and alcohol services, housing, Aboriginal, employment and social services.

Engagement with local government has been continuous through the life of the mine. The Cloncurry Regional Council plays a vital role in reviewing and providing feedback on potential project impacts on local government services.

Stakeholder Consultation Register

A Stakeholder Consultation Register is a process used to manage and document the engagement and involvement of stakeholders. It is used to record historical consultation activities and feedback and will be updated in future to document future consultation activities. Detail of past stakeholder consultation has been summarised in Table 2.

Table 2 Consultation Register

Consultation date	Community member	Consultation type	Information provided	Issues raised by community	How issues were considered	Decisions / outcomes	Commitments
18/11/2020	Andrew Davey (MDH)	Phone Message to Paul Tan	Logistics of crane hire for installation of new bore generator to supply water to Tick Hill tank.	Pilgrim Creek generator installation to supply water to Tick Hill Tank.	Paul Tan organised Carnaby staff to meet on site 17/11/2020 with MDH personnel to arrange installation of generator at Pilgrim Creek bore.	New generator installed.	Maintain contact with station owner if any issues arise with new generator.
29/03/2021	Andrew Davey (MDH)	Phone Text - Paul Tan to Andrew Davey	Discussion about grader work pipe access track from Tick Hill main tank to secondary cattle watering point.	Need pipe to supply water to secondary tank.	Paul Tan organised with BIM to use their grader to put in pipe access track.	New track and water pipe installed.	None
19/02/2022	Andrew Davey (MDH)	Phone Message to Paul Tan	Pump issues with Pilgrim Creek bore and pipe leak.	Require pipe repair and replacement bore.	Remploy engaged by MDH to carry out pump replacement and repairs.	Carnaby has paid for pump replacement and pipe repair.	Maintain communication with MHD regarding water pipe and bore.
24/01/2023	Al Macdonald (MDH)	Phone Message from Paul Tan	Advise of break in at Tick Hill containers	Theft	Station owner notified	Cloncurry Police followed	None

Consultation date	Community member	Consultation type	Information provided	Issues raised by community	How issues were considered	Decisions / outcomes	Commitments
						up with investigation.	
23/06/2023	Al Macdonald (MDH)	Phone Message from Paul Tan	Advice over proposed air geophysics flyover	Possible impact on mustering.	Station owner notified	Aircraft activity approved. No Impact.	None

Details of PRCP Consultation Process

Objectives for community consultation

The objective for THGM community consultation is to involve the key stakeholders in the decision-making processes that directly impact them. THGM aims to gather insights and feedback through conversation to understand perspectives and experiences for the final rehabilitation outcome.

How the Stakeholders will be Engaged

THGM has an established relationship with key stakeholders, discussions have been informal, however open and progressive relating to THGM operations and environmental performance.

As part of the ongoing stakeholder consultation at THGM, CNB staff will engage with key stakeholders and landholders to discuss rehabilitation and closure concerns, as required by the PRCP. Discussions will include but will not be limited to, potential post-mining land uses, rehabilitation performance, targeted vegetation and alternative water supply arrangements (AWSAs).

Consultation Plan

As part of the ongoing consultation the relevant stakeholders will be engaged to outline their concerns and views of the future of THGM see Table 3. Those methods are as follows:

- Ongoing face-to-face meetings,
- Site drives and inspections; and
- Written communication.

Face-to-face meetings

Face-to-face meetings have a proven track record of productive engagement and have been conducted by representatives of CNB with landholders and businesses e.g. the Duchess Hotel. Face-to-face meetings facilitate real-time collaboration, problem solving and immediate feedback.

Site drives and inspections

Taking site drives and inspections with stakeholders is valuable in providing stakeholders with a visual understanding of the site to be rehabilitated and to better inform their engagement with the proposed post mining land uses for the site. Stakeholders can see first-hand the proposed plans and they can help to identify potential constraints and opportunities.

Written communication

Written communication allows for clarity and precision. It will provide the stakeholders with accurate PRCP information to avoid misunderstandings. The stakeholder can then carefully formalate their thoughts, organise ideas, and articulate their options in a structural manner to formulate a response to CNB if there are any conserns or issues.

Proposed Consultation Frequency

Consultation should occur prior to any PRCP schedule amendments that are likely to impact the stakeholder, with the register updated as consultation is completed. Ongoing stakeholder consultation will continue throughout the stages of the PRCP.

Table 3 Consultation Plan

Identified stakeholder	Objective	Engagement type	Proposed consultation frequency	Released information	How feedback/comments are considered
Landholders **M.D.H Pty Ltd – representatives from Stanbroke and Chatsworth Stations**	Collaboration with key stakeholders.	Face-to-face meetings. Site drives and inspections. Written communication	Maintain effective Face-to-face as required. Site drives during rehabilitation planning, during rehabilitation works and after rehabilitation works to gain input. Written communication detailing the PRCP facts and PMLU.	PMLU and NUMA maps, rehabilitation schedule.	High - As a key stakeholder all feedback should be regarded as a valuable source of insight and suggestions should be taken aboard.
Community representatives from Duchess, Dajarra and The Monument.	Communities will experience little to no impact, the objective is to inform the community of the PRCP schedule and proposed outcomes.	Face-to-face meetings with key community members and leaders.	As required	Rehabilitation schedule.	Low - Keep the community updated of any changes or developments to maintain a positive relationship.
Community representatives from Cloncurry and Mt Isa	Communities will experience little to no impact. The objective is to inform the community of the THGM PRCP.	Written communication	As required	Awareness THGM of PRCP.	Low – provide updates only when required.

Identified stakeholder	Objective	Engagement type	Proposed consultation frequency	Released information	How feedback/comments are considered
Business operators and employees in the locality at the often used by CNB or contractors such as the Duchess Hotel	Medium impact on used businesses. The objective is to inform the cbusinessesof the PRCP schedule and proposed outcomes.	Face-to-face meetings with key businesses comminly used by CNB and contractors.Followed up with written communication.	Maintain effective face-to-face communication. Written communication will beon an as required basis.	Rehabilitation schedule. Periods of high and low required labour so businesses can plan for increased or decreased people using service.	Medium - Keep the businesses updated of any changes or developments. Take into consideration flutuation periods across other mines in the area that may impact business.
Business operators and employees in the locality that CNB or contractors do not directly use or use often Camps/caravan parks, schools/daycare, hospitality (restaurants, pubs, bars) and general stores and markets.	Businesses will experience little to no impact. The objective is to inform the businesses of the THGM PRCP.	Written communication	As required	Awareness THGM of PRCP.	Low – provide updates only when required.
The Yulluna People	Sharing information, collobrating and mobilizing support	Face-to-face meeting with key leader/s.	As required	PMLU and NUMA maps, rehabilitation schedule.	Medium - Keep the Yulluna People updated of any changes or developments.

Identified stakeholder	Objective	Engagement type	Proposed consultation frequency	Released information	How feedback/comments are considered
	during the PRCP process.	Written communication			Consider and action any cultural heritage impacts or concerns.
Kalkadoon Tribal Council and Kalkadunga Association in Mt Isa	Objective is to inform only when directed by the Yulluna people or if Yulluna representatives are not available.	Written communication	As required	PMLU and NUMA maps, rehabilitation schedule.	Low – provide updates only when required.
Local Government	Sharing information, and informing during the PRCP process.	Written communication	As required	PMLU and NUMA, maps, rehabilitation schedule	Low – provide updates only when required.
State and other Government.	Objective is to inform, collobrate and gather feedback.	Written communication	As required	Documents required by government bodies.	High – All feedback is of priority.

Summary

This document outlines the current community consultation process at THGM including stakeholder identification, stakeholder consultation type (details of how and when stakeholder will be engaged), engagement objectives, what information will be provided for community consultation as well as issues raised and will document the process by which feedback will be considered by THGM. THGM is remotely located, with no towns, villages or residences/homesteads located nearby (generally within 5 km). The region is a significant contributor to the Northwest Queensland economy, whereby mining and minerals processing is the central source of employment. The key stakeholders are:

- Landholders M.D.H Pty Ltd
- Community
- Business operators and employees in the locality
- Cultural Heritage
- Government

The objective for THGM community consultation is to involve the key stakeholders in the decision-making processes that directly impact them.

THGM has an established relationship with key stakeholders, discussions have been informal, however open, and progressive relating to THGM operations and environmental performance.

Stakeholder feedback is a valuable source of insight and suggestions that should be taken aboard from key stakeholders. As many stakeholders will have little to no impact they will be updated of any changes or developments. All feedback from government bodies is of priority.

Executive Summary

The Tick Hill Gold Mine ceased operations in 1994 and has been undergoing re-commercialisation through tailings reprocessing. This report outlines the results of tailings storage facility (TSF) cover modelling undertaken to support the Progressive Rehabilitation and Closure Plan (PRCP), in response to regulatory requirements from the Queensland Government Department of Environment, Tourism, Science and Innovation (DETSI).

Key features of the TSF include two engineered dam structures with a combined capacity of 600,000 m³ and an existing water-shedding cover system comprising waste rock and topsoil. The study focused on assessing the performance of various cover design scenarios to reduce net percolation (NP), mitigate seepage risks, and support site rehabilitation in alignment with the region's hot desert climate and regulatory expectations.

Findings

The key findings were:

- The hot arid climate with winter droughts supports the adoption of a store-and-release cover system to manage water retention and promote vegetation growth.
- Substantial variability was observed in texture and drainage classification (at 95% MDD) of potential cover material was observed. Sensitivity analysis was not carried out as it requires great deal of time and effort and full still doesn't capture heterogeneity cover material. Hence, field trial are essential to understand the overall performance of cover.
- A threshold NP was taken as 10% based on the information and considering the current scenario, expected spoil remains at closure, and risk of seepage to the surrounding environment. It was assumed that all tailings will be reprocessed leaving NAF spoils at closure reducing the metals concentration in seepage.
- All modelled cover scenarios achieved NP below the threshold value of 10%, except for the existing cover material scenario. By replacing the cover, there is a minimum of 50% reduction in the seepage as indicated by the analysed cover scenarios.
- Borrow pit materials and waste rock exhibited superior performance in minimising NP due to their lower hydraulic conductivity compared to the current TSF cover material.
- Model outputs are subject to simplifications, requiring validation through field trials.
- Salinities in cover material including tailings were very low and may not affect vegetation growth.

Recommendations

The recommendations include:

- Upgrade the cover system to a store and release cover by incorporating borrow pit or waste rock material to enhance the reduction in seepage.
- Conduct field-scale trials to validate modelling results and optimise cover performance under real-world conditions. Refine the cover design based on trial results and evolving environmental or regulatory requirements.
- Manage the drainage on the top surface to avoid drainage concentrations that may lead to increased NP.
- Implement or upgrade to a comprehensive long-term monitoring program to track cover system performance, groundwater quality, and vegetation establishment.
- Prepare an inventory of cover materials to assess the material volumes required and to ensure that adequate volumes are available for each material type.

- Maintain transparent communication with regulators, communities, and stakeholders to address concerns and ensure compliance with closure objectives.

1. Introduction

The Tick Hill Gold Mine (THGM) is situated around 110 km south-southeast of Mount Isa. Mining operations were halted in 1994, and the site has been under care and maintenance by various owners until recent efforts to re-commercialise it through tailings reprocessing. Key features of the site include an open cut pit, a partially capped tailings storage facility (TSF), a waste rock dump (WRD), a run-of-mine (ROM) pad, topsoil stockpiles, as well as a processing area with workshops and administrative buildings.

Mine Earth was engaged by JDR Mining & Civil to update the Progressive Rehabilitation and Closure Plan (PRCP) in response to the Queensland Government Department of Environment, Science, and Innovation's (DESI) request for an information letter dated 31 October 2023. Cover modelling and design form part of PRCP.

1.1 Geochemical risk and environmental considerations

The tailings are generally characterised by a very low acid-generation potential and minimal total metals content, indicating a low risk of neutral metalliferous drainage. Comprehensive geochemical investigations were conducted to assess potential risks from elevated metals such as copper and cyanide. Analyses of the pit, surface water, and groundwater quality revealed no evidence of acid metalliferous drainage (AMD) or neutral metalliferous drainage (NMD), which would likely have manifested given the cessation of operations nearly 30 years ago (Carnaby Resources Ltd, 2023).

Concentrations of total cyanide were assessed due to the presence in tailings. Levels in groundwater varied across groundwater bores at THGM. Low concentrations were generally found in all bores, with the exception of bores THGW001 and THGW008, where levels exceeded screening criteria. The variation in concentration of cyanide in these bores was found to be consistent with the vertical gradation of cyanide concentration in groundwater sourced from infiltration from the Tailing Storage Facility (TSF) to the south. It is highly likely that cyanide concentrations will steadily decrease over time and that cyanide expressing in pit water would be degraded by sunlight, as has already been occurring (Carnaby Resources Ltd, 2023).

1.2 Challenges and Opportunities

The TSF cover was not originally designed to minimise NP, and monitoring data indicates that seepage has occurred, resulting in the migration of contaminants such as copper and cyanide into the local groundwater aquifer and residual void (Carnaby Resources Ltd, 2023).The revised operation to relocate all tailings material offsite presents an opportunity to enhance the cover system and mitigate future seepage risks.

1.3 Report structure

This report is structured as follows:

1. **Introduction:** project description, overview of information review, and report outline.
2. **Background Information:** Provides the project background information on location and climatic conditions, information review, and examples of cover design in Western Australia.
3. **Field assessment:** Information sample collection, analysis, and results.
4. **Design criteria:** Type of cover, cover selection and design criteria
5. **Vadose zone modelling:** water balance modelling and discussion on modelling results.
6. **Conclusion and recommendations**: Provides conclusions and recommendations based on the study.

2. Background information

2.1 Location and climate

The THGM site is situated in north-central Queensland, approximately 40 km south of the township of Duchess and roughly 140 km southeast of Mount Isa. The region experiences a warm and predominantly dry climate year-round. Average daily temperatures range from 7°C to 24°C during the 'dry season' (April to September) and increase to 17°C to 40°C during the 'wet season' (October to March). According to 2023 data from the Bureau of Meteorology (BoM), the wet season receives an average monthly rainfall of 47 mm, while the dry season receives significantly lower rainfall, averaging 8.8 mm per month (Carnaby Resources Ltd, 2023).

The site layout is given in Figure 1 below.

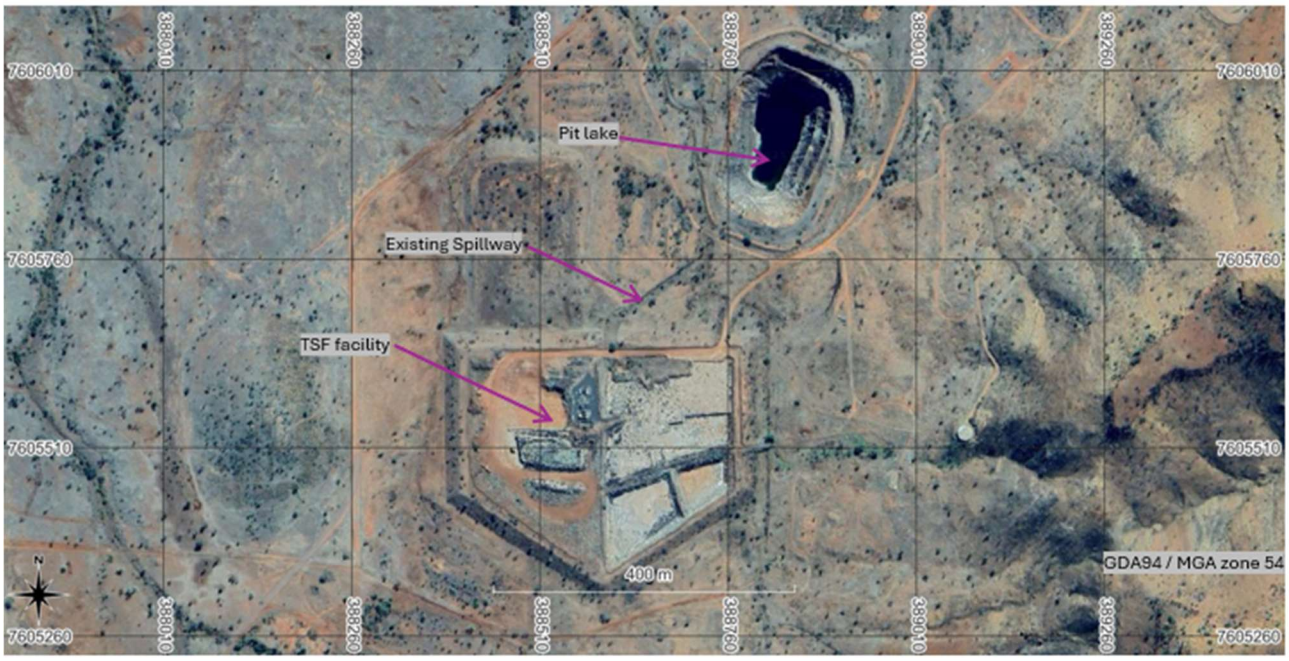

Figure 1: Site layout

2.2 Modified Koppen climate classification

The modified Koppen classification system for Australia based on standard 30-year climatology (1961 -1990) is available on Bureau of Meteorology(BoM) website. These classification maps show 6 major groups and 27 sub-groups of climate zones across Australia based on the concept that native vegetation is the best expression of climate in an area.

The project is in a hot desert zone with drought in winter (Figure 2) with annual average pan evaporation of 2,800 mm, which is about 7 times the annual average rainfall.

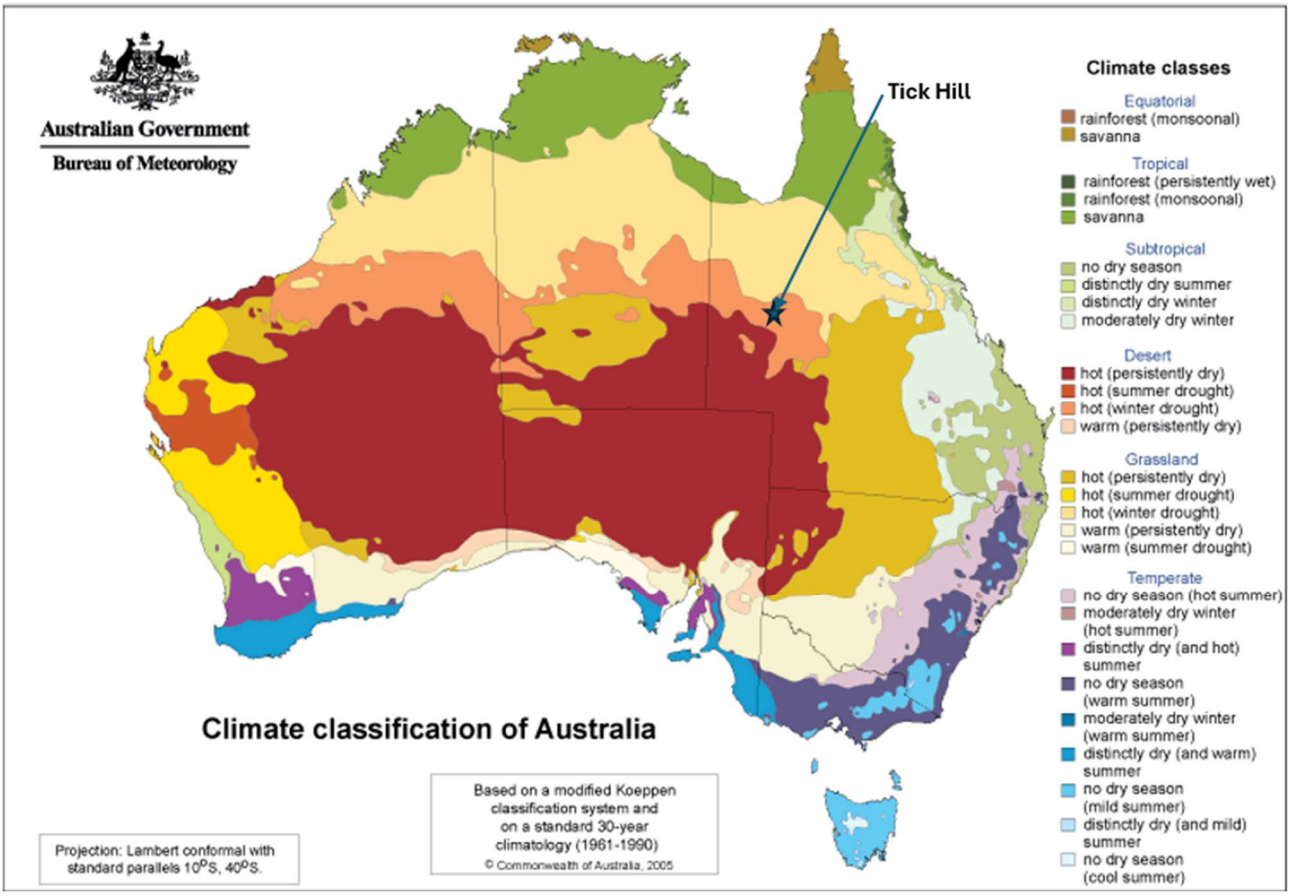

Figure 2: Climate classification of Australia with project location (BOM, 2024)

2.3 Tailings storage facility characteristics

The review of information pertaining to the tailings storage facility from the Progressive Rehabilitation and Closure Plan (Carnaby Resources Ltd, 2023) is summarised below;

- The tailing storage facility consists of two above-ground engineered dam structures with 10.5 m high embankments likely constructed at a single stage with a side slope of 1:3. The 500 mm clay liner in the base and clay core in the embankments were installed during construction.
- The surface areas of the western and eastern cells are 4.4 ha and 4.5 ha, respectively, with an overall capacity of 600,000 m3. The two cells are flat-topped and have a cell surface lower than the perimeter embankment, ranging from 6 – 10 m in depth.
- The water-shedding cover with waste rock mulch to a depth of 700-1,000 mm and topsoil of 100 mm was constructed without proper design to minimise Net Percolation (NP) and with drains and a spillway attached to the facility.
- Currently, approximately 2 ha of tailings has been disturbed for reprocessing, which is likely to continue until all the tailing has been reprocessed. The disturbed cover material has been stockpiled on the undisturbed part of TSF as of now.
- The tailings, in general, were regarded as having very low acid generation potential, and low total metals – meaning a low risk of neutral metalliferous drainage. Extensive investigation to understand the geochemical risk posed by any elevated metals such as copper and cyanide was carried out and noted that the pit, surface water and groundwater quality analysis do not reflect Acid Metalliferous Drainage (AMD) and Neutral Metalliferous Drainage (NMD), which would be expected to be apparent by now given the operation was ceased almost 30 years ago.

- The TSF was not designed to limit the NP, and the monitoring data indicates seepage has been occurring in the groundwater and contaminants have been migrating into the local groundwater aquifer, ultimately reporting to residual voids. Although it has been demonstrated that this will not result in any environmental harm, there is an opportunity to improve the cover system with the disturbance caused by reprocessing activities.

2.4 Examples of TSF cover design

A review of closure designs for TSF covers in Queensland and Western Australia was conducted to inform the identification and evaluation of cover concepts for the Project. A summary of TSF cover designs from 11 relevant Western Australian mines is presented in **Error! Reference source not found.**. The review highlights that there are a wide range of cover designs; from no cover, partial or variable depth covers, to relatively thick soil/waste rock covers, with or without application of a capillary break.

The information presented in **Error! Reference source not found.** has been collated from internal Mine Earth databases and as such, some details are not in the public domain. The names of the mine sites have therefore been excluded. It should also be noted that some of the cover designs presented in **Error! Reference source not found.** may have changed since the information was sourced.

Table 1: Examples of TSF cover designs in Western Australia

Mine details	TSF cover concepts
Metalliferous mine in Cloncurry region	High saline tailings and low capacity PAF. Cover will comprise a 0.3 m clay layer, with 1.0 m subsoil and 0.1 m topsoil cover.
Metalliferous mine in Cloncurry region	Low saline tailings and low capacity PAF. Low permeability and high clay content material used to construct 1.0+ m cap with 0.1 m growth media cover.
Metalliferous mine in Cloncurry region	PAF tailings. TSF cover to comprise capillary break 0.3 m - 0.4 m under 0.5 m reduced permeability layer, 1 m NAF waste rock layer, and 0.2 m growth medium cover.
Metalliferous mine in Cloncurry region	PAF tailings. TSF cover to comprise 0.3 m reduced permeability layer under 2.6 m store and release layer, and 0.3 m growth medium cover.
Gold mine in the WA Goldfields region	Hypersaline tailings. TSF cover will comprise a 0.5 m waste rock layer over the tailings and a final 0.3 m growth medium cover.
Nickel mine in the WA Goldfields region	Hypersaline tailings. TSF cover will comprise a 0.5 m waste rock layer over the tailings and a final 0.3 m growth medium cover.
Nickel mine in the WA Goldfields region	Hypersaline tailings and low capacity PAF. TSF cover will comprise 0.5 m waste rock only (limited growth medium available).
Gold mine in the WA Goldfields region	Hypersaline tailings. TSF was originally closed without a cover based on the assumption that the salt crust would control dust in the long term. This was not the case. The subsequent cover design comprised 0.5 m run-of-mine waste rock.
Nickel mine in the WA Goldfields region	PAF tailings. A non-vegetated upper TSF surface was proposed using a cover of 200 mm mill scats. The cover was designed to mitigate wind erosion.
Gold mine in the WA Goldfields region	Non-saline tailings. TSF cover comprised a layer of oxide mine waste with a surface application of growth medium (soil).
Gold mine in the WA Mid-West region	Hypersaline tailings. TSF cover comprised a 0.5 m waste rock layer.
Gold mine in the WA Goldfields region	Non-saline tailings. TSF cover comprised 2 m cover of oxide and a surface topsoil layer.

Mine details	TSF cover concepts
Gold mine in the WA Goldfields region	Hypersaline tailings. TSF closure plan comprised a coarse rockfill capillary break, transition layer, low permeability clay layer, and growth medium. The cover was to be shaped and graded to facilitate water shedding via a spillway designed to accommodate a 1:10-year ARI rainfall event.
Nickel mine in the WA Kimberly region	PAF tailings. TSF store and release cover comprised 0.3 m soil/waste rock mix overlying 2 m waste rock.
Gold mine in the WA Southwest region	Large valley fill TSF (1,250 ha). The tailings are non-saline but contain elevated cyanide. The TSF closure plan is for a thin cover comprising 300 mm gravel and 100 mm topsoil. The drainage from the TSF is designed to be discharged from the top surface.

3. Field assessment

3.1 Site visit and sample collection

A site visit was undertaken on 29 July – 1 August 2024 to collect samples to improve understanding of the sites' baseline (analogue) soils plus the characteristics of potential rehabilitation material.

Samples of in situ, undisturbed soil, stockpiled soil resources, potential borrow materials, existing decant and tailings cover materials, and waste rock from the waste rock dump were collected by Mine Earth and Tick Hill Mining representatives from 19 sites within the study as shown in Figure 3. Coordinates of the locations are provided in Table 2. The sampling locations comprised of in situ analogue soils (5 sampling locations) collected from 2 to 3 m depth intervals, plus waste rock.

Soil pits were excavated at each sampling location to a maximum depth of 1.5 m for the mechanical excavation sites, or to approximately 30 cm at those sites excavated using hand tools. Details of sample locations, soil profile descriptions, photographs of the soil profiles and surrounding vegetation at each location were recorded.

Table 2: Field sample locations

Site	Target feature	E_GDA94z54	N_GDA94z54	RL (m)
A1	Analogue soil	389082.2	7605553.63	377.46
A2	Analogue soil	389218.02	7606042.2	345.67

WR3	Waste Rock Dump	389097.58	7606173.77	342.45
A1	Analogue soil	389082.2	7605553.63	377.46

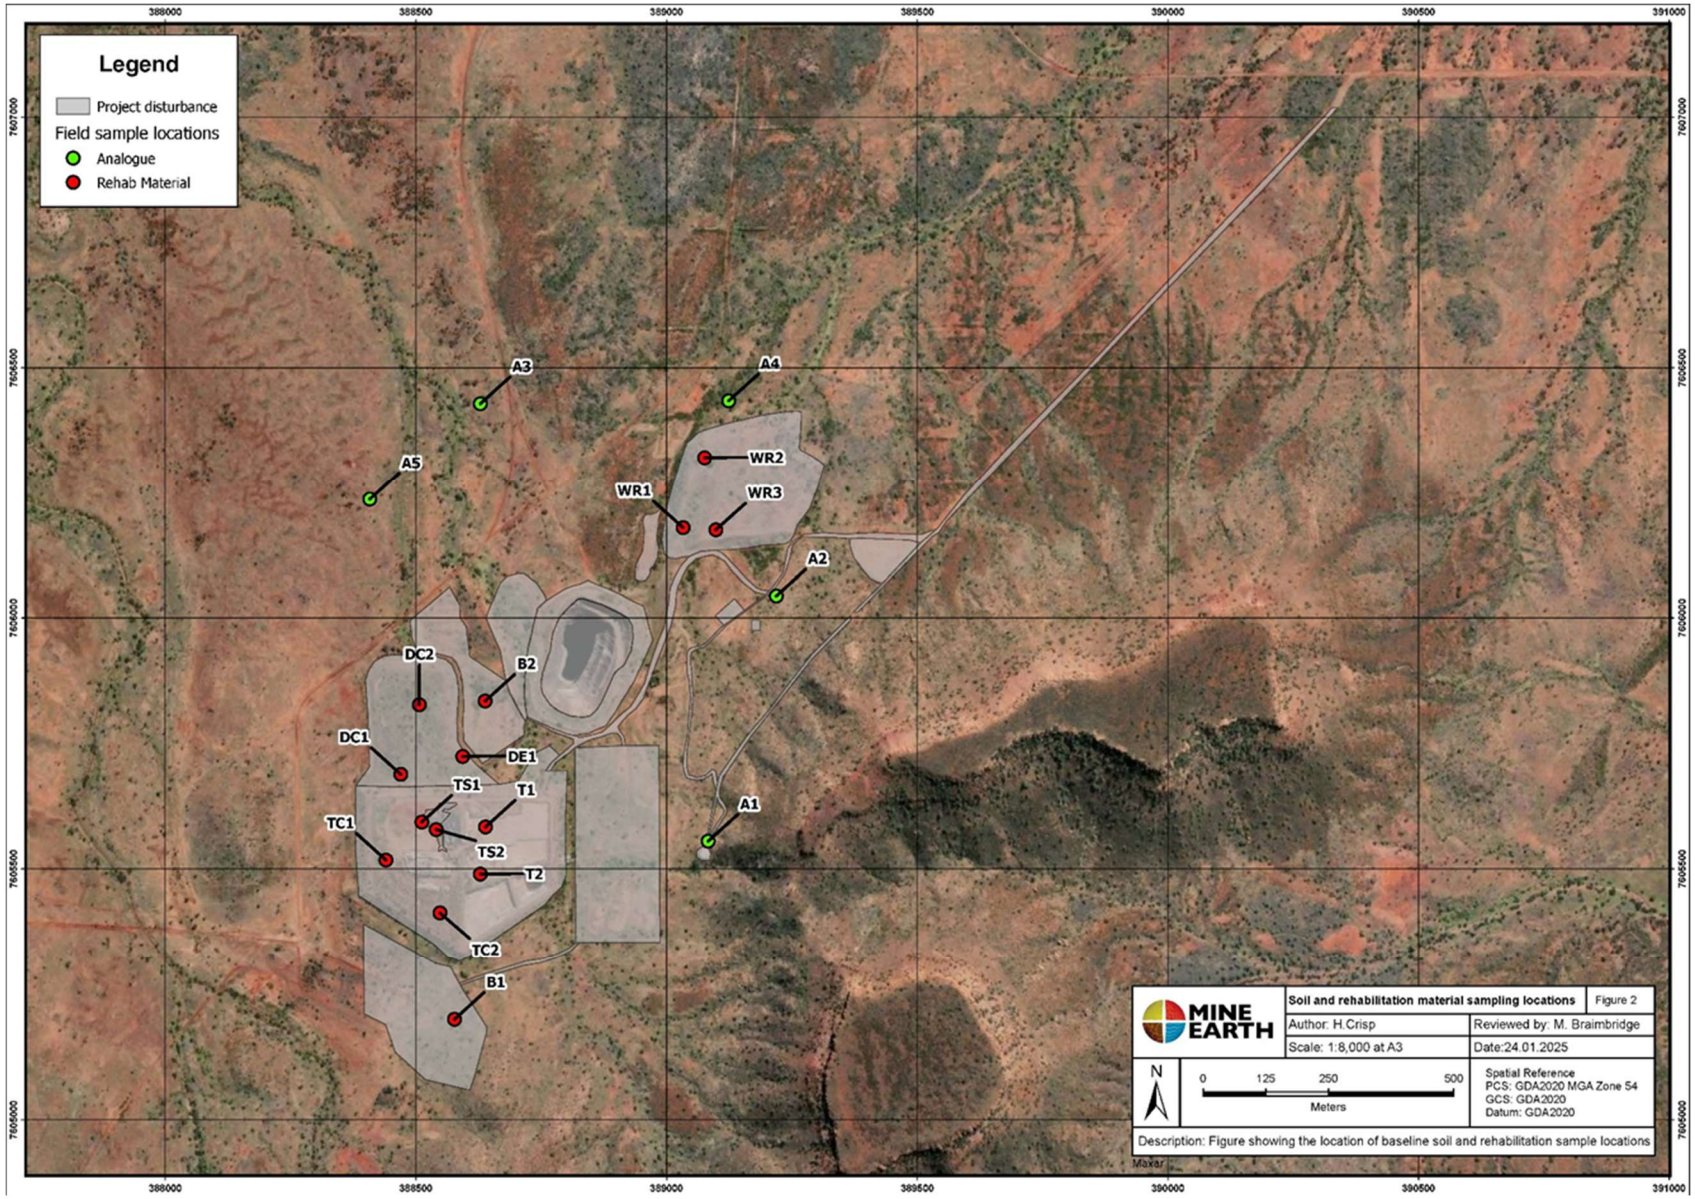

Figure 3: Field sample collection location

3.2 Potential cover material

During the site visit, the following potential cover materials were identified:

1. *Growth media/topsoil* - sand, sandy gravels and caprock should be selectively stockpiled to support vegetation cover.
2. *Weathered waste rock* - oxide and transitional waste from landforms comprising a mixture of high to low-stability material, could be potential cover material for low-permeability cover systems.
3. *Borrow pit material* - Clayey material with low permeability from nearby borrow pits could be another source of cover material.
4. *TSF cover material* - disturbed TSF cover material, currently stockpiled on an undisturbed portion of TSF is a potential cover material readily available at the site.

3.3 Laboratory testing

The constant head and falling head permeability tests, particle size distribution analysis, Emerson class number test, and soil water characteristics assessment were conducted by Trilab, Brisbane Laboratory. ALS Limited, Brisbane, performed the chemical characterisation, including pH, electrical conductivity, nutrient analysis, and organic matter content. The detailed laboratory results are provided in Appendix A for reference.

Mine Earth (2025) reviewed the physical and chemical characteristics of soil resources, waste rock and tailings materials, and found:

- Substantial variability was observed in the soil-sized fraction of waste rock, with clay content ranging from 2% to 24%, and variable hydraulic conductivity (at the measured 95% Maximum Dry Density, or MDD), with drainage classifications of ‘extremely slow’ to ‘very rapid’ was observed for waste rock material.
- The non-saline tailings texture was classified as Sandy Loam, with approximately 12% clay, and a drainage classification (at the measured 95% MDD) of ‘moderately slow and high-water holding capacity.
- The existing tailings cover material, comprising compacted oxide was observed to be variable coarse rock % (up to 80%), and clay content of the soil-sized fraction ranged from 9 to 12%. The existing cover material was found to have a low water-holding capacity and was classified as non-saline.
- The potential borrow material is a single-grained to massively structured sandy clay material (up to 22% clay) with variable coarse fragment content, up to 31%, with ‘extremely slow’ drainage classification (at 95% MDD).

The results were used to determine the Van Genuchten parameters required for SEEP/W (a tool used for cover modelling). The detailed discussion on the derivation of Van Genuchten is discussed in Section 5.3.3.

4. Design criteria

4.1 Type of cover

Cover systems are implemented to rehabilitate surface mine waste storage facilities by providing a stable, reliable, and sustainable engineered barrier between the mine waste and the surrounding environment. This system supports designated land uses while mitigating environmental degradation after mine closure. For reactive materials, minimising environmental impact typically involves controlling net percolation (NP) and/or limiting oxygen ingress during operations and post-closure (International Network for Acid Prevention , 2017).

The International Network for Acid Prevention (INAP) classifies cover systems into the following categories:

- Erosion-protection systems:
- Store-and-release systems:
- Enhanced store-and-release systems:
    - Low permeability layer
    - Capillary break layer
    - Seasonality Frozen Capillary Break Diversion:
- Barrier-type systems:
- Cover systems with engineered layers:
- Saturated soil or rock cover systems:

Given that Tick Hill is in a hot desert zone, characterised by winter drought conditions according to the modified Koppen climate classification system (Section 2.2), the main cover system considered for the Project is a store and release cover. This cover system stores infiltrating water within the rooting zone of the cover and is subsequently released via evapotranspiration, minimising the deep percolation. Additional layers of capillary break material may be added to provide textural discontinuity and enhance the store and release cover system.

While this recommendation aligns with the site's climatic conditions, it could be further validated and refined through a comprehensive multi-criteria assessment, incorporating a detailed evaluation of options and associated risks.

4.2 Models and design criteria

The modelling design criteria for each model are discussed below.

4.2.1 Water balance modelling

NP thresholds are shaped by regulatory frameworks and stakeholder-defined environmental tolerances. Regulations set binding guidelines on acceptable water quality and long-term environmental goals, ensuring compliance with national and regional laws. Stakeholders, including authorities, communities, and industry representatives, influence the NP thresholds based on site-specific environmental, social, and economic risks. Stricter tolerances may apply in sensitive areas, while more flexible thresholds may be allowed in less vulnerable regions, provided risks are manageable. These thresholds ensure compliance with environmental laws and long-term protection goals.

Currently, NP thresholds are not available for the project. Mine Earth reviewed the available information and concluded that a 10% NP threshold can be adopted for the following reasons:

- Overburden material (tailings) will be fully reprocessed, and only non-acid forming (NAF) spoils will remain at closure
- Though the seepage with elevated metals such as copper and cyanide was observed, it is expected to decrease with the removal of tailings.
- The impact of seepage is confined to a nearby pit lake.

4.2.2 Solute transfer/salt dynamics modelling

Salt significantly impacts plant germination and growth, although the extent of this impact varies depending on the plant species, as some are more tolerant to elevated salinity levels.

The Department of Primary Industries and Regional Development, Western Australia provides guidance on salinity tolerance of plants for agriculture and revegetation in Western Australia. The salinity is broadly divided into five major classes (Table 3) and more than 200 plants/species were grouped under these classes based on their salinity tolerance.

The samples tested in the laboratory indicated that all the samples (including tailings) have salinity less than 2 dS/m and are classified as non-saline as per the Table 3. Hence, salinity target and solute transfer modelling is not required for this project.

Table 3: Salinity classification (Department of Primary Industries and Regional Development, 2025)

Salinity (dS/m)	Salinity Class
< 2	non-saline
2–4	slightly saline
4–8	moderately saline
8–16	very saline
>16	extremely saline

5. Vadose zone modelling

5.1 Conceptual model

The conceptual model for the cover system is presented in Figure 4. Precipitation falling on the TSF can generate seepage through the cover layers. As this seepage percolates through zones of high salt concentration, it can dissolve and transport soluble salts downward through the cover.

Concurrently, evaporation creates a suction effect, potentially drawing soluble salts upward through the cover via capillary action. These salts may accumulate in the upper layers as pore water evaporates. The impact of evaporation diminishes with depth and can be effectively interrupted by a layer of coarse rock with low fine content within the unsaturated zone. This coarse layer eliminates the small capillaries necessary for upward capillary movement.

It is important to note that the effectiveness of this capillary break is compromised if the water table rises above it. In such cases, the break becomes ineffective in preventing upward salt migration.

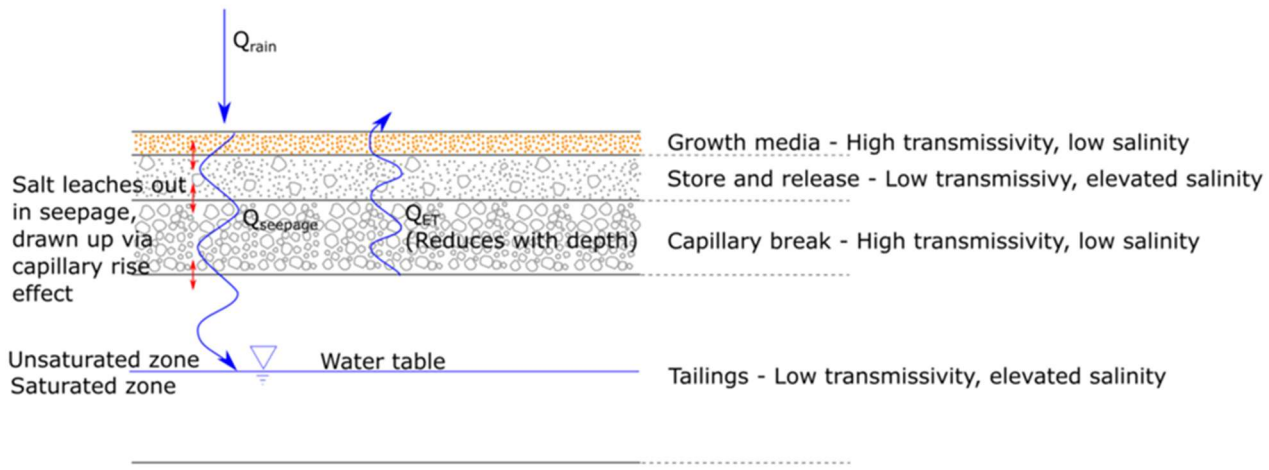

Figure 4: Conceptual cover model

5.2 Water balance modelling

Several cover scenarios were developed considering different cover depths and material types and modelled using SEEP/W analysis in GeoStudio to predict the relative performance of multiple cover scenarios. Water balance modelling was completed using parameters derived for the topsoil, waste rock, tailings and screened fresh rock presented in 5.3.2.

SEEP/W solves the water transfer equation which can be calculated from a mass balance equation at the ground surface, which is given by:

$$\left(q_{P(precipitation)} + q_{M(snowmelt)}\right)\cos\alpha(slope\ ange) + q_{E(Evaporation)} + q_{R(rainfall)} = q_{I(infiltration)}$$

The slope angle is included because precipitation is measured for a horizontal plane. The infiltration is deemed the residual of the surface mass balance equation and therefore forms the boundary condition of the water transfer equation.

5.3 Modelling methods

GeoStudio 2024.2.1 was employed to undertake modelling of the interaction between land and climate in a cover system. This modelling aimed to simulate the hydraulic response in an engineered soil cover and the underlying tailings while considering varying climate conditions. To simulate the water dynamics in these types of systems effectively, the land-climate interaction boundary condition in SEEP/W is preferred because this boundary condition accounts for several factors such as precipitation, evaporation, runoff, and root water uptake that occur beneath the ground surface (GEO-SLOPE International Ltd.)

5.3.1 Climate data

The long-term daily rainfall data was obtained from Monument Station (Bureau of Meteorology Station No. 37107), while other climate data were obtained from Cloncurry Airport Station (Bureau of Meteorology Station No. 29141). The rainfall and climate data were analysed: where <96% of the days have data recorded, the year was excluded and 10 years of data (1981, 1984, 2004-2006, 2008-2010, 2012 and 2013) were selected for analysis. For wind speed and relative humidity, the last twelve months' daily data from the BOM website were used and repeated in cycles to create 10 years of data. The climate data used in the analysis is shown in 5 to 9 below.

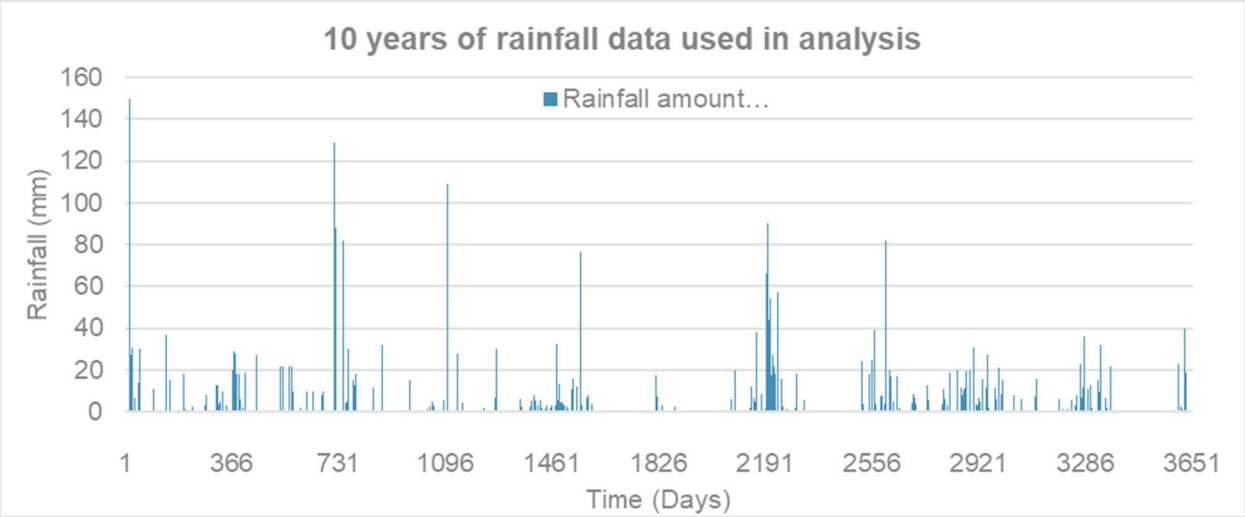

Figure 5: Rainfall data

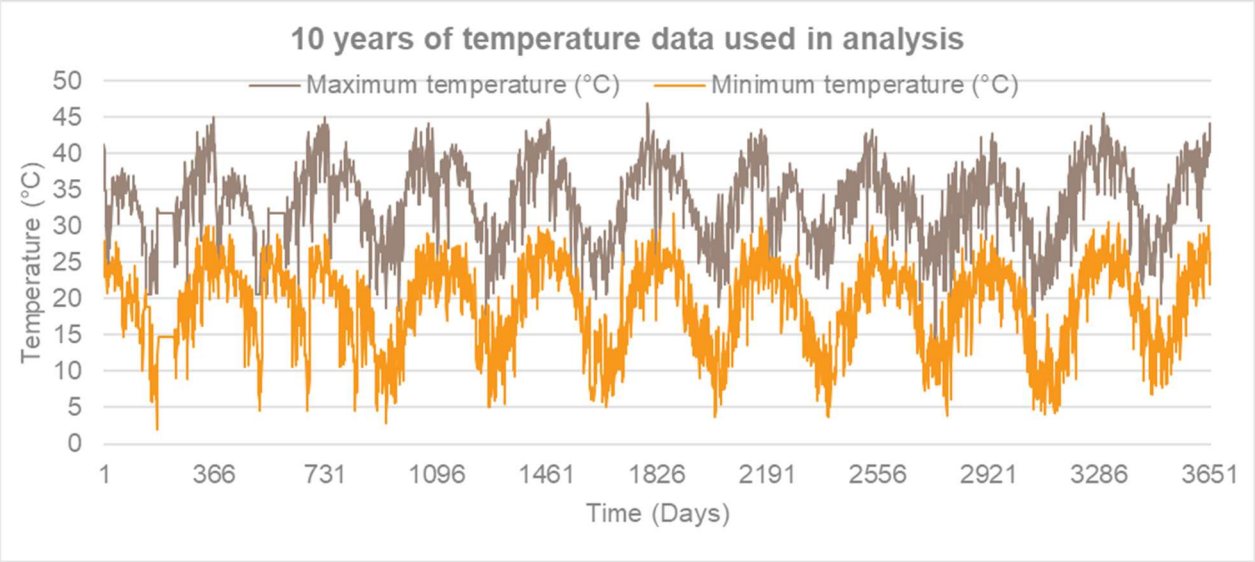

Figure 6: Temperature data

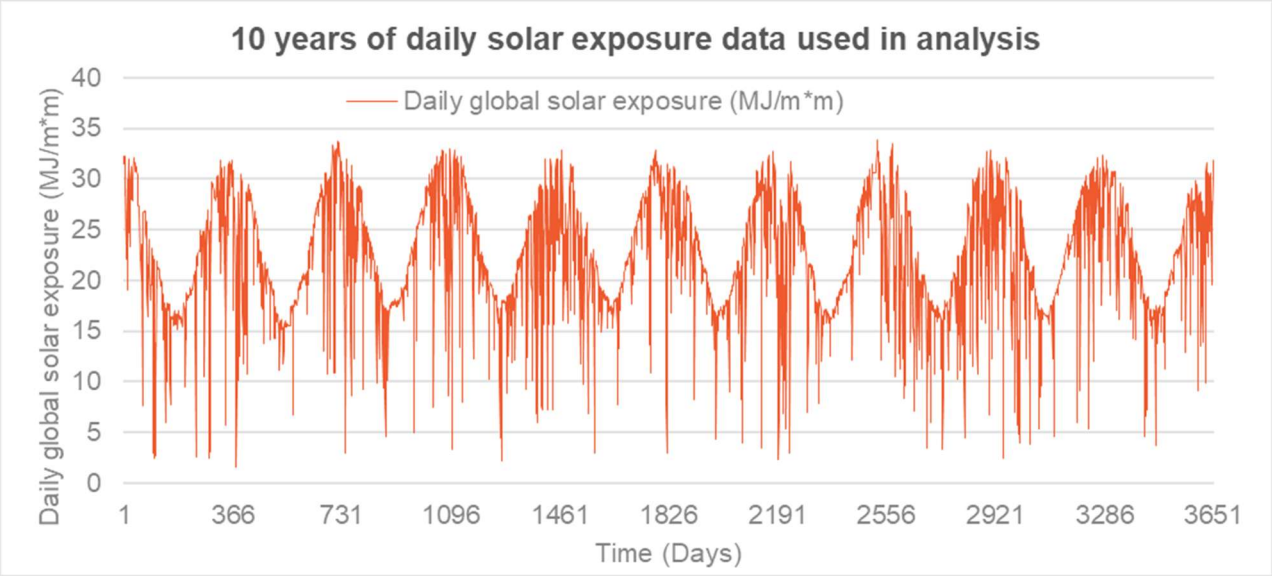

Figure 7: Daily solar exposure data

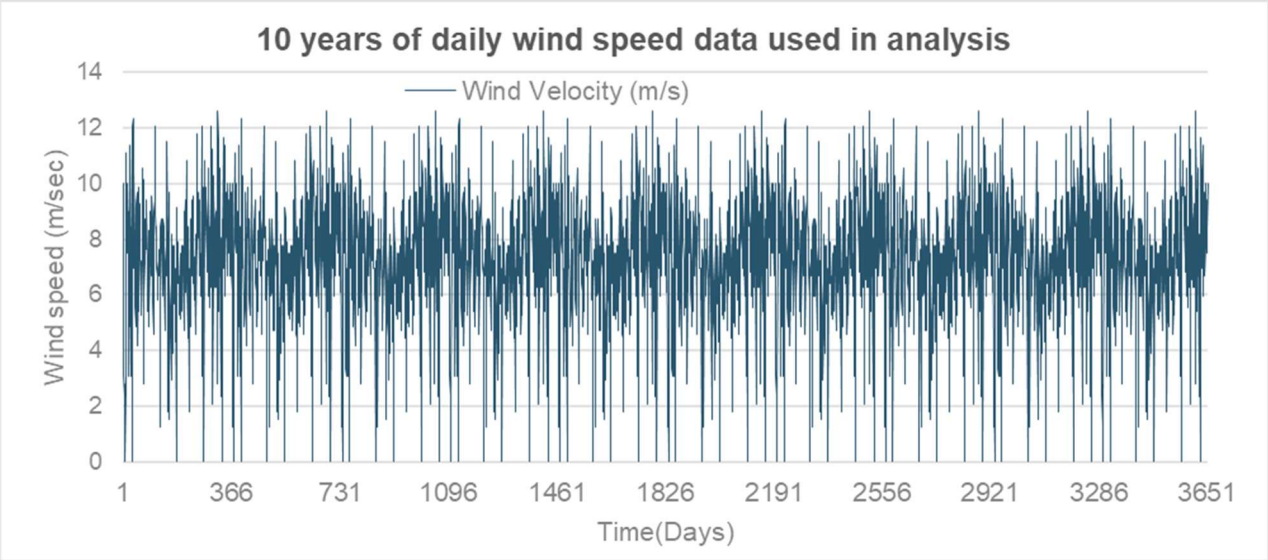

Figure 8: Wind speed data

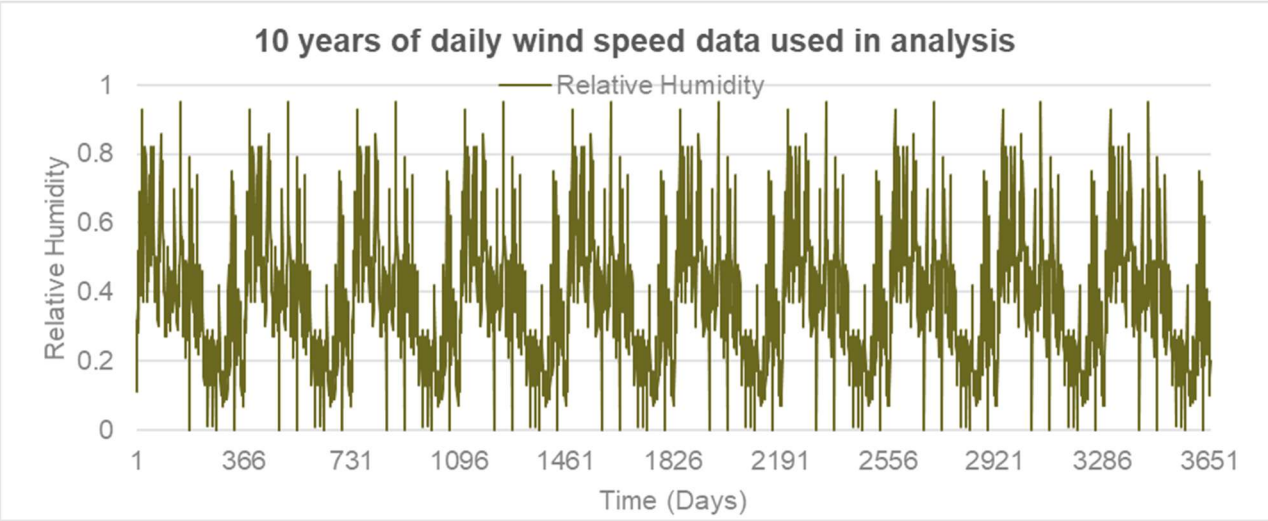

Figure 9: Relative Humidity data

5.3.2 Soil properties

Samples collected during the site visit were sent to laboratories to determine the saturated hydraulic conductivity, water retention curve and salinity. These results were further analysed to finalise input parameters. **Error! Reference source not found.** below provides the salinity, dry density and saturated hydraulic conductivity. The detailed test results are attached in Appendix A.

Table 4: Sample properties

Sample ID	Material	Dry density (kg/m^3)	K_{sat} (m/sec)	Salinity g/m^3
24090391	Tailings	1,570	1.50E-06	-
24090392	Tailings Cover 1	2,210	1.00E-05	35
24090393	Tailings Cover 2	2,190	3.10E-05	-

24090390	Tailings	1,580	3.30E-06	112

5.3.3 Van Genuchten parameter

SEEP/W employs the Van Genuchten-Mualem porosity model to predict unsaturated flow behaviour. The Van Genuchten-Mualem porosity model employs five variables to estimate the Van Genuchten parameter for a specific soil: residual soil water content (θr), saturated soil water content (θs), the α parameter in the soil water retention function (α), the n parameter in the soil water retention function (n) and the saturated hydraulic conductivity (Ks). For a given pressure h, the van Genuchten-Mualem porosity model predicts the water content using the following equation:

$$\theta(h) = \theta_r + \frac{\theta_s - \theta_r}{[1 + (\propto \cdot h)^n]^{1-1/n}}$$

The Van Genuchten parameters for each type of soil were developed using the following approach:

- For all samples, the RETC model v6.02 (Van Genuchten et al, 2009) was utilised to predict the θr, θs, α and n for each soil type using the soil water holding capacity taken from the laboratory analysis of the samples. The r^2 for the modelled water characteristic curve was calculated against the measured value. In all cases, there was a strong correlation between the modelled and observed data.
- Topsoil was not sampled for the project. The parameters of topsoil from similar projects were adopted.

The summary of Van Genuchten's parameters is provided in **Error! Reference source not found.** below. The parameters highlighted in light blue are selected as representative of different cover materials and were used in the analysis.

All the tailings will be harvested and only the 500 mm thick compacted clay base with ground surface below it remains at closure. Assumes that the base material will have parameters similar to the sample Borrow material 2, except for the hydraulic conductivity which was increased by one order. Also, it was assumed that the compacted tailings will have similar properties to Decant Pond cover 1.

Table 5: Summary of Van Genuchten parameters

Material	Θr (cm^3/cm^3)	Θs (cm^3/cm^3)	1/α (kPa)	n	R^2 value
Tailings	0.0247	0.3614	40.5032	3.8094	98%
Tailings Cover 1	0.0080	0.1329	10.9056	1.4358	98%
Tailings Cover 2	0.0165	0.1072	31.1275	2.5125	96%
Waste Rock Dump1	0.0000	0.3686	10.6664	1.2725	98%
Waste Rock Dump 2	0.0000	0.3499	4.9370	1.2647	97%
Waste Rock Dump 3	0.0084	0.1196	36.5822	3.5067	97%
Borrow material 1	0.1128	0.3291	36.6262	2.5793	97%
Borrow material 2	0.0670	0.3513	31.7301	1.5799	99%
Decant Pond cover 1	0.0308	0.2634	44.6329	3.1548	100%
Decant Pond cover 2	0.0000	0.3151	8.3653	1.2020	96%
Decant Pond embankment	0.0000	0.3619	7.8147	1.1973	97%
Tailings	0.0286	0.3901	38.0196	3.4569	96%

5.3.4 Model setup

1D SEEP/W transient flow analysis was set in GeoStudio 2024.2.1. Each scenario was set up with the modelled cover system overlying a 5 m layer of base material. Two scenarios including 0.5 m of compacted clay and 0.3 m of compacted clay were considered to check the model sensitivity to the thickness of the compacted clay layer. The thickness of the material layer in the cover system provides very little advantage over the material properties and constructability in reducing net percolation. The different cover scenarios analysed are shown in Table 6 below.

The model was run assuming no vegetation. This setting is conservative as vegetation will increase evapotranspiration.

The model was set up for 3650 days (10 years) and four hours increments (21,900 steps) were used to run the model.

Table 6: Cover scenarios modelled

Scenario name	Base material	Compacted clay (CCL)	Borrow pit material (BM)	Tailing cover (TC) material (m)	Waste rock (WR) material (m)	Growth media (GM)
0.5CCL+1.5BM+0.2GM	5	0.5	1.5			0.2
0.3CCL+1.5BM+0.2GM	5	0.3	1.5			0.2
0.3CCL+1BM+0.2GM	5	0.3	1			0.2
0.3CCL+1WR+0.2GM	5	0.3			1	0.2
0.3CCL+1TC+0.2GM	5	0.3		1		0.2

5.3.5 Activation pore water pressure

The activation pore water pressure was determined by referring to the moisture content of samples and corresponding matric suction values in the soil water characteristic curves. This activation pore water pressure was applied to the model to define the initial condition for the material types. **Error! Reference source not found.** provides the activation pore water pressure considered for modelling purposes.

Table 7: Activation pore pressure and assumed initial degree of saturation

Parameters	Growth Media	Borrow pit material	Compacted clay	Base material	Tailing cover material	Waste rock material
Assumed initial degree of saturation	40%	40%	40%	40%	35%	15%
Activation pore water pressure (kPa)	-28.5	--100	-110	-100	-100	-100

5.3.6 Boundary conditions

The following boundary conditions were applied:

- The land climate interactions boundary condition at the surface node was used to apply the observed weather data at the top of the model. The Penman-Wilson method was selected to estimate evapotranspiration.
- Use of the free drainage boundary condition should ideally be applied in transient analysis and only specified on bottom mesh boundaries that are relatively far away from your main area of focus (GeoStudio, 2014) . This boundary condition was applied to the bottom of the tailings material.

5.3.7 1D Vadose zone modelling results

A detailed discussion of modelling results from each analysis is presented below.

5.3.7.1 Water balance

SEEP/W partitions precipitation into infiltration, evaporation and runoff. In SEEP/W, when the applied flux(precipitation) exceeds infiltration capacity (zero pressure is reached at the boundary), all excess water is instantaneously removed by surface runoff. The NP (net percolation) was calculated as cumulative water volume moving through the whole cover system for the analysis period of 10 years.

The Figure 10 below presents the water balance components for the 0.3CCL+1BM+0.2GM cover scenario in cumulative water volumes (m^3/m^2). End-of-simulation volumes were used to calculate the yearly average values. These volumes were then divided by the years the model was run to calculate the annual average value. For example, the simulated end-of-simulation rainfall was 4.11 m^3/m^2, which amounts to an average yearly rainfall of 411 mm. This simulated rainfall equals the 10-year average calculated from the input precipitation data. The water balance results for all modelled scenarios are presented in Table 8. The negative value indicates water moving out of the cover system while the positive value indicates water moving into the cover system. The modelled annual average potential evapotranspiration was 2,506 mm.

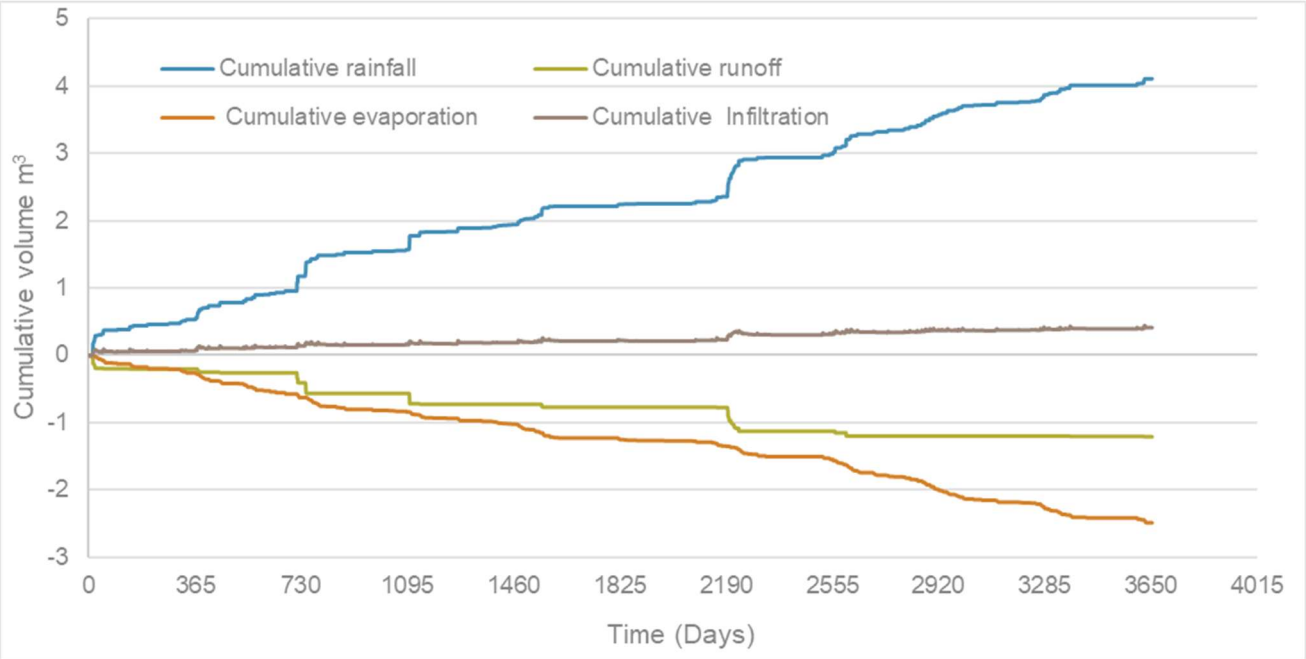

Figure 10: Water balance component of 0.3CCL+1BM+0.2GM scenario

Table 8: Average annual water balance component of all modelled scenarios

Scenario name	Rainfall (mm)	Infiltration (mm)	Evaporation(mm)	Runoff / Ponding (mm)	Net percolation (%)
0.5CCL+1.5BM+0.2GM	411	36.4	252.6	121.9	4.60%
0.3CCL+1.5BM+0.2GM	411	39.6	250.2	212.1	5.57%
0.3CCL+1BM+0.2GM	411	41	249	121	6.36%
0.3CCL+1WR+0.2GM	411	13	264.8	133.2	1.56%
0.3CCL+1TC+0.2GM	411	79	266.7	65.3	15.49%

5.3.7.2 Degree of saturation and rainfall comparison

The degree of saturation at various depths over the years is illustrated below in Figure 11. The degree of saturation at the surface of compacted clay is significantly influenced by rainfall, while the degree of saturation below 1 m of base material remains almost constant, indicating that negligible fluxes go into the base material in the 10-year analysis period.

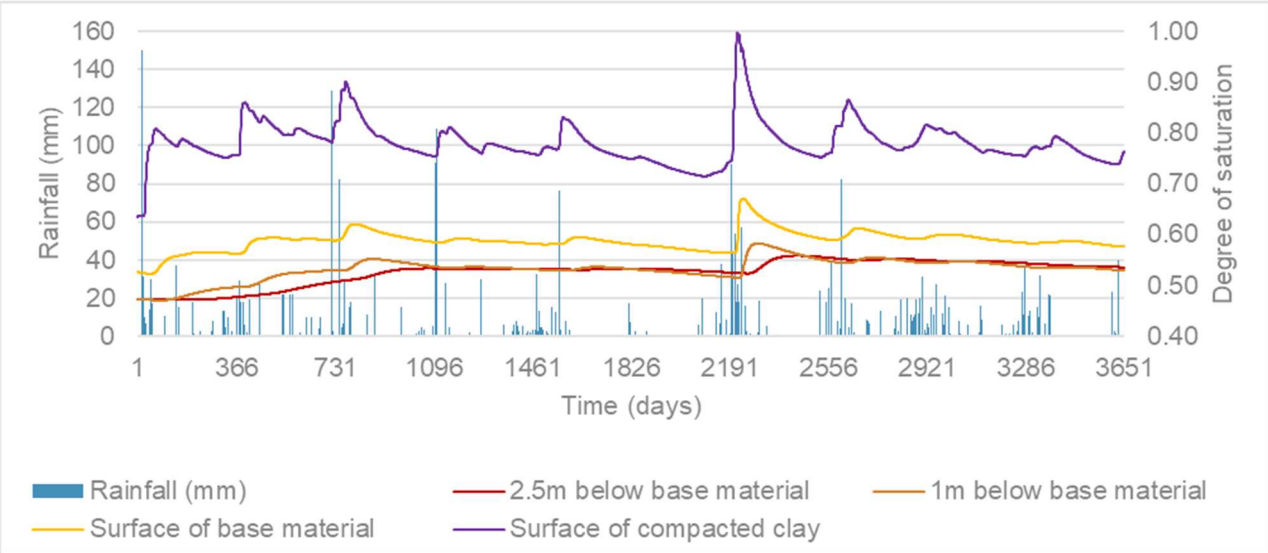

Figure 11: Rainfall and degree of saturation at different depths

5.4 Discussion

The water balance modelling results indicate that all the analysed cover scenarios are technically viable, except for existing cover scenarios (0.3CCL+1TC+0.2GM) in achieving NP less than the threshold value. Among the materials evaluated, borrow pit material and waste rock material demonstrated superior performance in reducing NP compared to the existing TSF cover material as they have relatively lower hydraulic conductivity, which effectively limits water infiltration through the cover system.

5.4.1 Cover design outcomes

The modelling results indicate that except for the existing cover material scenario (0.3CCL+1TC+0.2GM), all other scenarios will have an NP below the threshold value of 10% provided that minimum cover thickness of 1 m plus 200 mm topsoil are achieved. The material from the waste rock dump (WR) outperforms all other cover scenario analyses with NP as low as 1.56%.

This finding highlights the potential benefits of utilising borrow pit material or waste rock for future cover upgrades or replacements. Incorporating these materials could enhance the cover system's ability to minimise infiltration and reduce the risk of seepage.

5.4.2 Cover design uncertainty

It is noted that all models are simplified predictions of real-world behaviour and that there are inherent uncertainties associated with models. To validate the model outputs and inform the final closure approach, it is recommended to undertake trials to assess cover system performance. This could be done via an instrumented cover supported with a lysimeter.

6. Conclusion and recommendations

The conclusion and recommendations are presented below.

6.1 Conclusion

The key conclusions from the study are:

- The hot arid climate with winter droughts supports the adoption of a store-and-release cover system to manage water retention and promote vegetation growth.
- Substantial variability was observed in texture and drainage classification (at 95% MDD) of potential cover material was observed. Sensitivity analysis was not carried out as it requires great deal of time and effort and full still doesn't capture heterogeneity cover material. Hence, field trial are essential to understand the overall performance of cover.
- A threshold NP was taken as 10% based on the information and considering the current scenario, expected spoil remains at closure, and risk of seepage to the surrounding environment. It was assumed that all tailings will be reprocessed leaving NAF spoils at closure reducing the metals concentration in seepage.
- All modelled cover scenarios achieved NP below the threshold value of 10%, except for the existing cover material scenario. By replacing the cover, there is a minimum of 50% reduction in the seepage as indicated by the analysed cover scenarios.
- Borrow pit materials and waste rock exhibited superior performance in minimising NP due to their lower hydraulic conductivity compared to the current TSF cover material.
- Model outputs are subject to simplifications, requiring validation through field trials.
- Salinities in cover material including tailings were very low and may not affect vegetation growth.

6.2 Recommendations

The recommendations from the study are:

- Upgrade the cover system to a store and release cover by incorporating borrow pit or waste rock material to enhance the reduction in seepage.
- Conduct field-scale trials to validate modelling results and optimise cover performance under real-world conditions. Refine the cover design based on trial results and evolving environmental or regulatory requirements.
- Manage the drainage on the top surface to avoid drainage concentrations that may lead to an increased NP.
- Implement or upgrade to a comprehensive long-term monitoring program to track cover system performance, groundwater quality, and vegetation establishment.
- Prepare an inventory of cover materials and assess the required volumes against the available material volumes for each material type.
- Maintain transparent communication with regulators, communities, and stakeholders to address concerns and ensure compliance with closure objectives.

Test Method: AS 1289 5.1.1 (Standard) & AS 1289.2.1.1

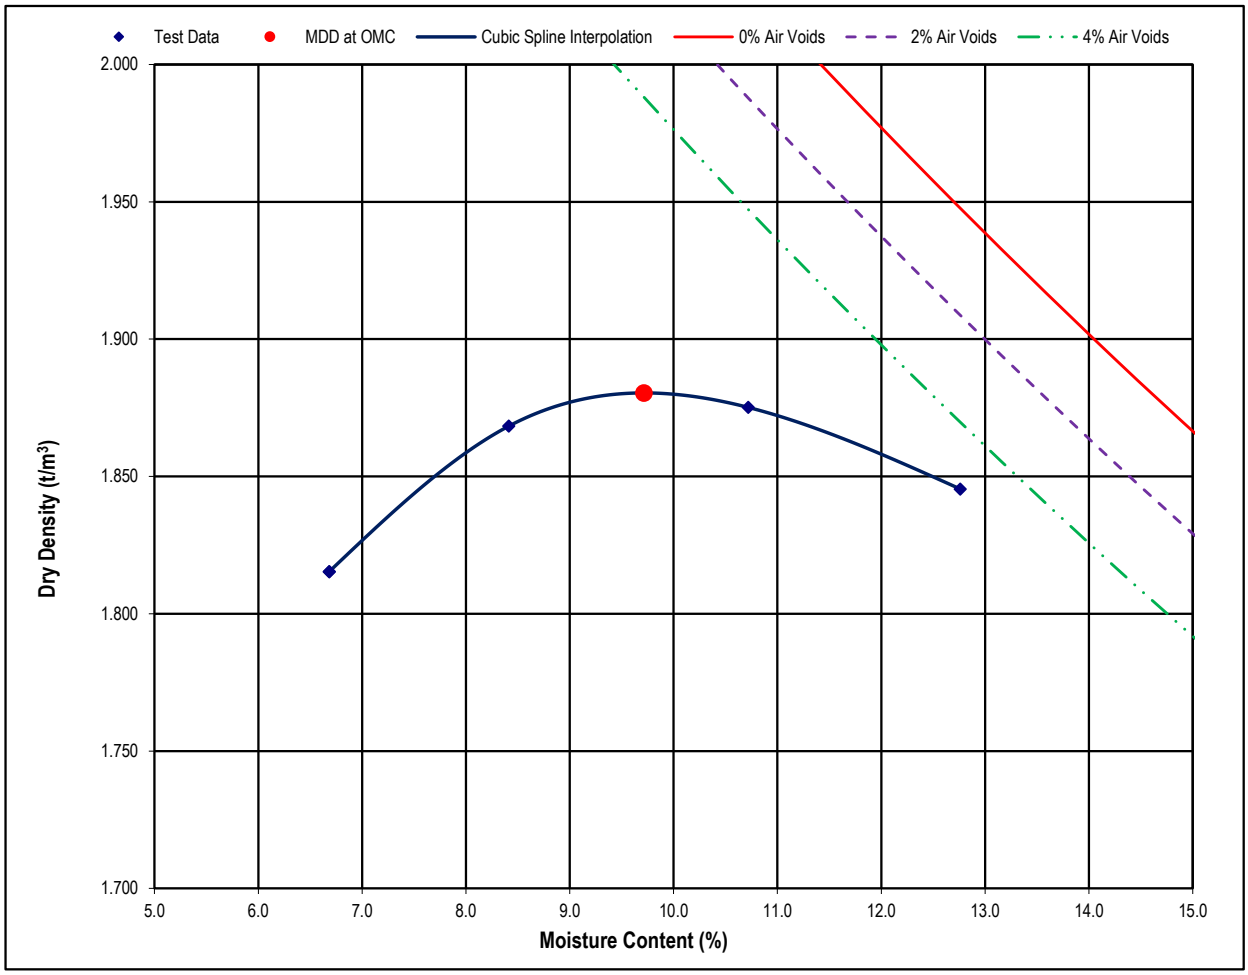
Client	Mine Earth	**Report No.**	24090399-MDR
		Workorder No.	9919/T/654
Address	Unit 1, 94 Forsyth Street O'Connor WA 6163	**Test Date**	10/10/2024
		Report Date	18/10/2024
Project	TCK-2405		
Client ID	DC1	**Location** Not Supplied	**Depth (m)** Not Supplied
Description	Not Supplied		



Maximum Dry Density (t/m^3)	1.88	**Optimum Moisture Content (%)**	9.7
Moisture Content (%)	2.3	**Percentage of Oversize/Sieve Size (mm)**	15 / 19

NOTES/REMARKS:

Curing Time (hrs): 24 * Based on Visual/Tactile assessment of material.

Sample/s supplied by the client % Voids based on assumed SG of 2.59

Accredited for compliance with ISO/IEC 17025 - Testing

*NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates

Tested at Trilab Brisbane Laboratory

Approved Signatory

Michael Ferguson

PERMEABILITY BY FALLING HEAD TEST REPORT

Test Method AS 1289 6.7.2, 5.1.1

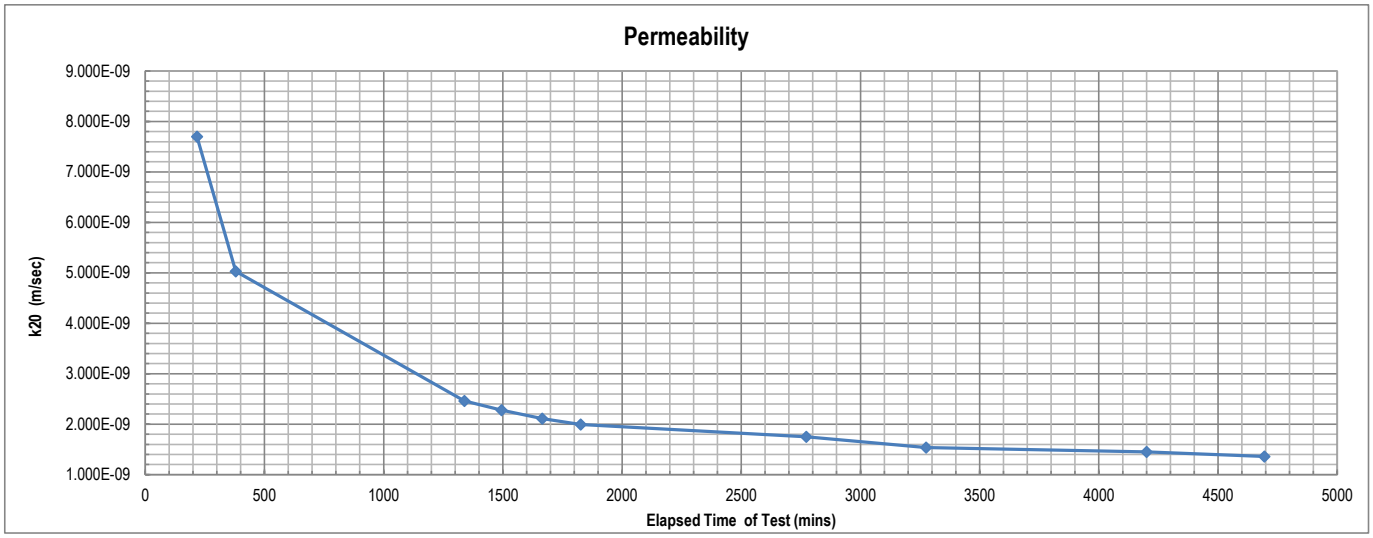
Client	Mine Earth	**Report No.**	24090401-FPER
		Workorder No.	9919/T/654
Address	Unit 1, 94 Forsyth Street O'Connor WA 6163	**Test Date**	5/11/2024
		Report Date	20/11/2024
Project	TCK-2405		
Client ID	DE1	**Depth (m)**	Not Supplied
Description	Not Supplied	**Sample Type**	Remoulded Soil Specimen

RESULTS OF TESTING

Compaction Method	**AS1289.5.1.1 - Standard Compaction**		
Maximum Dry Density (t/m^3)	**1.86**	Hydraulic Gradient	**11.2**
Optimum Moisture Content (%)	**14.1**	Surcharge (kPa)	**3.6**
Placement Moisture Content (%)	**14.0**	Head Pressure Applied (kPa)	**12.75**
Moisture Ratio (%)	**99.6**	Water Type	**Deaerated**
Placement Wet Density (t/m^3)	**2.02**	Percentage Material Retained/Sieve Size (mm)	**0 % /19 mm**
Density Ratio (%)	**95.0**	Sample Height and Diameter (mm)	**116 / 152.26 mm**

PERMEABILITY $k_{(20)} = 1.4 \times 10^{-09}$ **(m/sec)**



Remarks: The above specimen was remoulded to a target of 95% of Standard Maximum Dry Density and at Optimum Moisture Content.

Sample/s supplied by client The compaction data was supplied by the client.

Accredited for compliance with ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- ED009-X (Standard Anions - Extended Method –by IC): Some samples were diluted due to matrix interference. LOR adjusted accordingly.
- EA150H: Soil particle density results fell outside the scope of AS1289.3.6.3. Results should be scrutinised accordingly.
- ALS is not NATA accredited for the analysis of Exchangeable Aluminium and Exchange Acidity in soils when performed under ALS Method ED005.
- ALS is not NATA accredited for the analysis of Exchangeable Cations on Alkaline Soils when performed under ALS Method ED006.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- EG005T (Total Metals by ICP-AES): Sample EB2428324-003 shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ED093C (Leachable Major Cations): Unable to report Sodium results due to it's inclusion in the extraction fluid.
- ED006 (Exchangeable Cations on Alkaline Soils): Unable to calculate Magnesium/Potassium Ratio result for some samples as required Exchangeable Magnesium and/or Potassium results are less than the limit of reporting.
- ED006 (Exchangeable Cations on Alkaline Soils): Unable to calculate Calcium/Magnesium Ratio result for some samples as required Exchangeable Calcium and/or Magnesium results are less than the limit of reporting.
- ED006 (Exchangeable Cations on Alkaline Soils): Sample DC-ALS (EB2428229-006) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- It is recognised that EG005T (Total Metals by ICP-AES) is less than EG005C (Leachable Metals by ICP-AES) for some samples. However, the difference is within experimental variation of the methods.
- ED045G (Chloride)/ ED041G (Sulfate as SO4): Some samples were diluted due to matrix interference. LOR adjusted accordingly.
- EA058 Emerson: V. = Very, D. = Dark, L. = Light, VD. = Very Dark
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCl - Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. All pages of this report have been checked and approved for release. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to Assist with Quality Review and Sample Receipt Notification.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position (Accreditation Category)
Beatriz Llarinas	Senior Chemist - Inorganics (Brisbane Inorganics, Stafford, QLD)
	Senior Chemist - Inorganics (Brisbane Soil Preparation, Stafford, QLD)
Ben Felgendrejeris	Senior Acid Sulfate Soil Chemist (Brisbane Acid Sulphate Soils, Stafford, QLD)
	Senior Acid Sulfate Soil Chemist (Brisbane Soil Preparation, Stafford, QLD)
Dave Gitsham	Metals Instrument Chemist (Brisbane Inorganics, Stafford, QLD)
Layla Hafner	Acid Sulphate Soils - Chemist (Brisbane Acid Sulphate Soils, Stafford, QLD)
Vincent Muller	Chemist - Inorganics (Brisbane Inorganics, Stafford, QLD)
	Chemist - Inorganics (Brisbane Soil Preparation, Stafford, QLD)

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.
Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.
Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Where a result is required to meet compliance limits, the associated uncertainty **must be** considered. Refer to the ALS Contract Terms and Conditions for details, and EnviroMail 53 for a guide on how to interpret the measurement of uncertainty (MU).

Work Order Specific Comments

- ED009-X (Standard Anions - Extended Method –by IC): Some samples were diluted due to matrix interference. LOR adjusted accordingly.
- EA150H: Soil particle density results fell outside the scope of AS1289.3.6.3. Results should be scrutinised accordingly.
- ALS is not NATA accredited for the analysis of Exchangeable Aluminium and Exchange Acidity in soils when performed under ALS Method ED005.
- ALS is not NATA accredited for the analysis of Exchangeable Cations on Alkaline Soils when performed under ALS Method ED006.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- Ionic Balance out of acceptable limits due to analytes not quantified in this report.
- EG005T (Total Metals by ICP-AES): Sample EB2428324-003 shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ED093C (Leachable Major Cations): Unable to report Sodium results due to it's inclusion in the extraction fluid.
- ED006 (Exchangeable Cations on Alkaline Soils): Unable to calculate Magnesium/Potassium Ratio result for some samples as required Exchangeable Magnesium and/or Potassium results are less than the limit of reporting.
- ED006 (Exchangeable Cations on Alkaline Soils): Unable to calculate Calcium/Magnesium Ratio result for some samples as required Exchangeable Calcium and/or Magnesium results are less than the limit of reporting.
- ED006 (Exchangeable Cations on Alkaline Soils): Sample DC-ALS (EB2428229-006) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- It is recognised that EG005T (Total Metals by ICP-AES) is less than EG005C (Leachable Metals by ICP-AES) for some samples. However, the difference is within experimental variation of the methods.
- ED045G (Chloride)/ ED041G (Sulfate as SO4): Some samples were diluted due to matrix interference. LOR adjusted accordingly.
- EA058 Emerson: V. = Very, D. = Dark, L. = Light, VD. = Very Dark
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCl - Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Parameter	CAS Number	LOR	----	Result MU	----	----	----
EA001: pH in soil using 0.01M CaCl extract							
pH (CaCl2)	----	0.1	pH Unit	7.9	----	----	----
EA002: pH 1:5 (Soils)							
pH Value	----	0.1	pH Unit	8.6	----	----	----
EA010: Conductivity (1:5)							
Electrical Conductivity @ 25°C	----	1	µS/cm	219	----	----	----
EA055: Moisture Content (Dried @ 105-110°C)							
Moisture Content	----	1.0	%	10.9	----	----	----
EA058: Emerson Aggregate Test							
Color (Munsell)	----	-	-	Weak Red (2.5YR 5/2)	----	----	----
Texture	----	-	-	Sandy Clay Loam	----	----	----
Emerson Class Number	EC/TC	-	-	3	----	----	----
EA150: Particle Sizing							
+75µm	----	1	%	49	----	----	----
+150µm	----	1	%	14	----	----	----
+300µm	----	1	%	<1	----	----	----
+425µm	----	1	%	<1	----	----	----
+600µm	----	1	%	<1	----	----	----
+1180µm	----	1	%	<1	----	----	----
+2.36mm	----	1	%	<1	----	----	----
+4.75mm	----	1	%	<1	----	----	----
+9.5mm	----	1	%	<1	----	----	----
+19.0mm	----	1	%	<1	----	----	----
+37.5mm	----	1	%	<1	----	----	----
+75.0mm	----	1	%	<1	----	----	----
EA150: Soil Classification based on Particle Size							
Clay (<2 µm)	----	1	%	11	----	----	----
Silt (2-60 µm)	----	1	%	35	----	----	----
Sand (0.06-2.00 mm)	----	1	%	54	----	----	----
Gravel (>2mm)	----	1	%	<1	----	----	----
Cobbles (>6cm)	----	1	%	<1	----	----	----
EA152: Soil Particle Density							
Soil Particle Density (Clay/Silt/Sand)	----	0.01	g/cm3	2.82	----	----	----
ED006: Exchangeable Cations on Alkaline Soils							
ø Exchangeable Calcium	----	0.2	meq/100g	0.9	----	----	----
ø Exchangeable Magnesium	----	0.2	meq/100g	<0.2	----	----	----
ø Exchangeable Potassium	----	0.2	meq/100g	<0.2	----	----	----
ø Exchangeable Sodium	----	0.2	meq/100g	<0.2	----	----	----
ø Cation Exchange Capacity	----	0.2	meq/100g	0.9	----	----	----
ø Exchangeable Sodium Percent	----	0.2	%	<0.2	----	----	----
ED021: Bicarbonate Extractable Potassium (Colwell)							
Bicarbonate Extractable K (Colwell)	----	100	mg/kg	381	----	----	----
ED045G: Chloride by Discrete Analyser							
Chloride	16887-00-6	10	mg/kg	<10	----	----	----
ED092: DTPA Extractable Metals							
ø Copper	7440-50-8	1	mg/kg	11	----	----	----
ø Iron	7439-89-6	1	mg/kg	16	----	----	----
ø Manganese	7439-96-5	1	mg/kg	4	----	----	----
ø Zinc	7440-66-6	1	mg/kg	<1	----	----	----
EG005(ED093)T: Total Metals by ICP-AES							
Arsenic	7440-38-2	5	mg/kg	<5	----	----	----

No. of samples analysed	: 24		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 24

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✗ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001	SOIL	In house: Referenced to Rayment and Lyons 4B3 (mod.) or 4B4 (mod.) 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM Schedule B(3).
pH (1:5)	EA002	SOIL	In house: Referenced to Rayment and Lyons 4A1 and APHA 4500H+. pH is determined on soil samples after a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
pH by Auto Titrator	EA005-P	SOIL	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Electrical Conductivity (1:5)	EA010	SOIL	In house: Referenced to Rayment and Lyons 3A1 and APHA 2510. Conductivity is determined on soil samples using a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
Total Dissolved Solids (High Level)	EA015H	SOIL	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Emerson Aggregate Test	EA058	SOIL	In house: Referenced to AS1289.3.8.1. Testing is performed only on soils with suitable aggregates; sands and gravels are usually unsuitable for this test. The test classifies the behaviour of soil aggregates, when immersed, on their coherence in water.
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3
Soil Particle Density	EA152	SOIL	Soil Particle Density by AS 1289.3.5.1: Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method
Exchange Acidity by 1M Potassium Chloride	* ED005	SOIL	In house: referenced to Rayment and Lyons, method 15G1. This method is unsuitable for near neutral and alkaline soils. NATA accreditation does not cover performance of this service.
Exchangeable Cations on Alkaline Soils	* ED006	SOIL	In house: Referenced to Soil Survey Test Method C5. Soluble salts are removed from the sample prior to analysis. Cations are exchanged from the sample by contact with alcoholic ammonium chloride at pH 8.5. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil.
Exchangeable Cations	ED007	SOIL	In house: Referenced to Rayment & Lyons Method 15A1. Cations are exchanged from the sample by contact with Ammonium Chloride. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil. This method is compliant with NEPM Schedule B(3).
Exchangeable Cations with pre-treatment	ED008	SOIL	In house: Referenced to Rayment & Lyons Method 15A2. Soluble salts are removed from the sample prior to analysis. Cations are exchanged from the sample by contact with Ammonium Chloride. They are then quantitated in the final solution by ICPAES and reported as meq/100g of original soil. This method is compliant with NEPM Schedule B(3).
Standard Anions -by IC (Extended Method)	ED009-X	SOIL	In house: Referenced to APHA 4110B. This method is compliant with NEPM Schedule B(3)
Bicarbonate Extractable K (Colwell)	ED021	SOIL	In house: Referenced to Rayment & Lyons Method 18A1 Potassium is extracted from the soil using 0.5M NaHCO3 at a 1:100 soil:solution ratio and determined by ICP.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by Auto Titrator	ED037-P	SOIL	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	SOIL	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	SOIL	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
DTPA Extractable Metals	* ED092	SOIL	In house: Referenced to Rayment and Lyons 12A1
Leachable Major Cations	ED093C	SOIL	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations in leachates are determined by either ICP-AES or ICP-MS techniques.
Leachable Metals by ICPAES	EG005C	SOIL	In house: referenced to APHA 3120; USEPA SW 846 - 6010: The ICPAES technique ionises leachate sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Leachable Mercury by FIMS	EG035C	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the TCLP solution. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Fluoride by Auto Titrator	EK040P	SOIL	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	SOIL	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ammonia Using Steam Distillation and Titrimetric Finish	EK055-P	SOIL	In house: Referenced to APHA 4500-NH3 B&G, H Samples are steam distilled prior to analysis and quantified using titration, FIA or Discrete Analyser.
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 4500-NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.

Analytical Methods	Method	Matrix	Method Descriptions
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 4500-NO3- F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Thermo Scientific Method D08727 and NEMI (National Environmental Method Index) Method ID: 9171. This method covers the determination of total oxidised nitrogen (NOx-N) and nitrate (NO3-N) by calculation, Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosphorus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Reactive Phosphorus as P-By Discrete Analyser	EK071G	SOIL	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Bicarbonate Extractable P (Colwell)	EK080	SOIL	In house: Referenced to Rayment & Lyons Method 9B1 Phosphorus is extracted from the soil using 0.5M NaHCO3 at a 1:100 soil:solution ratio and determined by FIA.
Organic Matter	EP004	SOIL	In house: Referenced to AS1289.4.1.1. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
pH in soil using a 0.01M CaCl2 extract	EA001-PR	SOIL	In house: Referenced to Rayment and Lyons 4B1, 10 g of soil is mixed with 50 mL of 0.01M CaCl2 and tumbled end over end for 1 hour. pH is measured from the continuous suspension. This method is compliant with NEPM Schedule B(3).
Exchangeable Cations Preparation Method (Alkaline Soils)	* ED006PR	SOIL	In house: Referenced to Rayment and Lyons method 15C1.
Exchangeable Cations Preparation Method	ED007PR	SOIL	In house: Referenced to Rayment & Lyons method 15A1. A 1M NH4Cl extraction by end over end tumbling at a ratio of 1:20. There is no pretreatment for soluble salts. Extracts can be run by ICP for cations.
Bicarbonate Extractable K (Colwell)	ED021PR	SOIL	In house: Referenced to Rayment & Lyons Method 18A1 Potassium is extracted from the soil using 0.5M NaHCO3 at a 1:100 soil:solution ratio and determined by ICP.
DTPA Extraction for Cu, Zn, Mn, Fe (2 hour leach)	ED092PR	SOIL	In house: Referenced to Rayment & Lyons Method 12A1 2 hour end over end tumbler extraction with 0.005M DTPA at a ratio of 1:2. Extracts can be run by ICP for metals.
TKN/TP Digestion	EK061/EK067	SOIL	In house: Referenced to APHA 4500 Norg- D; APHA 4500 P - H. Macro Kjeldahl digestion.
Sample Preparation for Bicarbonate Extractable P (Colwell)	EK080-PR	SOIL	In house: Referenced to Rayment & Lyons Method 9B1 Phosphorus is extracted from the soil using 0.5M NaHCO3 at a 1:100 soil:solution ratio.
Digestion for Total Recoverable Metals in TCLP Leachate	EN25C	SOIL	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of reagent grade water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
ASLP for Non & Semivolatile Analytes - Glass Leaching Vessel	EN60a-G	SOIL	In house QWI-EN/60 referenced to AS4439.3 Preparation of Leachates
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Organic Matter	EP004-PR	SOIL	In house: Referenced to AS1289.4.1.1. Dichromate oxidation method after Walkley and Black. This method is compliant with NEPM Schedule B(3).

1 EXECUTIVE SUMMARY

WK Geotechnical (WKG) was requested by Carnaby Resources Limited (Carnaby) to undertake a geotechnical Pre-Feasibility Study (PFS) for the Tick Hill Mine.

The scope of work undertaken for the geotechnical PFS for the Tick Hill Mine comprised the following items:

- Part A – Site Visit
  - Pit wall inspections of accessible areas
  - Inspect potential failure zone on the north-west wall
  - Review core from three holes (TH023RD, TH075RD and TH077RD) and other holes if required.
- Part B – Design Study
  - Review Carnaby supplied electronic data, including a 3D lithological and structure model
  - Source any geotechnical records including core photos from the Diatreme Resources Brisbane office
  - Construct a geotechnical model
  - Undertake slope stability assessments
  - Develop pit wall design recommendations
  - Prepare report.

Key findings of the study are:

- Non electronic data sources or laboratory testing data constrained the detail of investigation.
- Discontinuity shape/roughness and alteration/infill was not logged in any of the boreholes by Carpentaria Gold loggers.
- RQD generally agreed with comments regarding shear zones or core loss, i.e. lower RQD was assigned to intervals with these features.
- It was noted that weathering varied down hole. It is possible that the loggers were confusing weathering with alteration.
- The geotechnical model calculated rock quality ranging from Poor to Good (GSI descriptions), which agreed with observations of the existing pit.

2 INTRODUCTION AND BACKGROUND

WK Geotechnical (WKG) was requested by Carnaby Resources Limited (Carnaby) to undertake a geotechnical Pre-Feasibility Study (PFS) for the Tick Hill Mine, in preparation for the resumption of mining.

The Tick Hill Mine is located 110 kilometres south of Mount Isa, and 16 kilometres north of The Monument township (Figure 1) which services the nearby Phosphate Hill Mine. The Tick Hill deposit was discovered in September 1989 by MIM Exploration and first gold poured on 31 December 1991 (MIM 1993).

The Tick Hill Gold Deposit was mined between 1991 and 1995 by MIM Holdings Limited subsidiary Carpentaria Gold Pty Ltd. Mining at Tick Hill was by an open pit with decline access to an underground mine beneath the open pit, with a ventilation shaft connecting the levels and also serving as an escape route. The decline and shaft were capped at the completion of mining but are expected to be recoverable if required for further mining. Mine workings are currently flooded (Diatreme 2015).

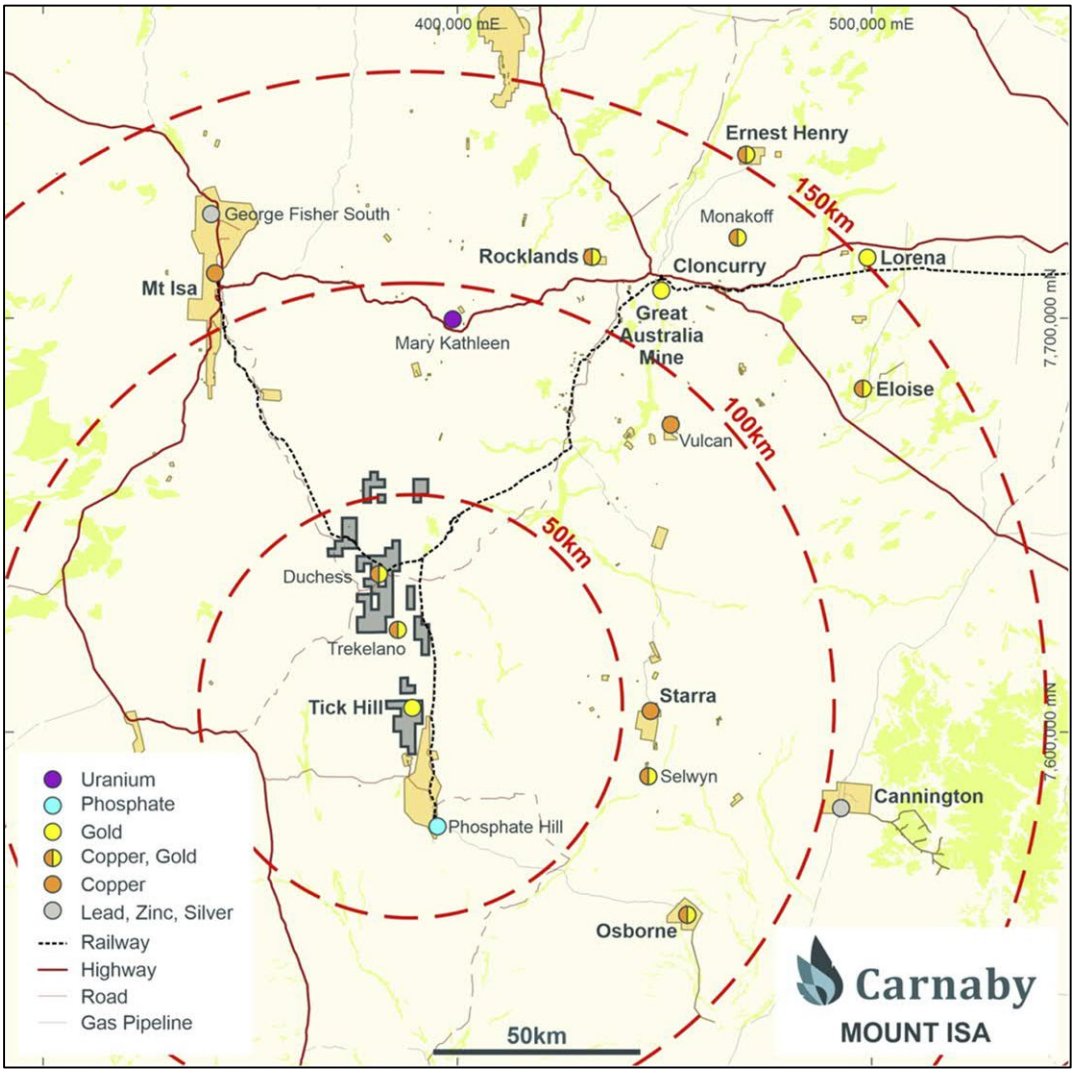

Figure 1: Tick Hill Mine location (Carnaby 2020)

A Scoping Study was completed by Carnaby with the results released in March 2020 (Carnaby 2020). [redacted]

The scope of work undertaken for the geotechnical PFS for the Tick Hill Mine comprised the following items:

- Part A – Site Visit
  - Pit wall inspections of accessible areas
  - Inspect potential failure zone on the north-west wall
  - Review core from three holes (TH023RD, TH075RD and TH077RD) and other holes if required.
- Part B – Design Study
  - [redacted]
    - [redacted]
    - [redacted]
    - [redacted]
    - [redacted]
    - [redacted]

3 INFORMATION SOURCES

3.1 Geotechnical Information

At Carnaby's request, WKG visited the Brisbane office of Diatreme Resources on 5th May 2020 to collect data of geotechnical relevance. The focus for data collection was geotechnical information from selected boreholes intersecting the western wall, preferably boreholes that existed in the on-site core yard so that the logs could be checked against the core.

No previous geotechnical reports (operational or design) or geomechanical laboratory test data could be located. Of the data that was available, none was electronic.

Table 1 summarises the 'Basic Geotechnical Logs' that were located. These are paper logs that were processed electronically for this assessment. Figure 2 illustrates the borehole locations and the existing pit.

Table 1: Basic geotechnical logs

Borehole	Logged Interval (m)
TH007RD	60.50 – 177.40
TH010RD	20.20 – 99.90
TH021RD	35.50 – 243.40
TH023RD	48.00 – 159.00
TH024D	6.00 – 76.00
TH025D	6.00 – 99.00
TH040RD	71.60 – 123.00
TH041RD	83.70 – 141.00
TH045RD	71.50 – 125.90
TH075RD	101.80 – 164.60
TH077RD	89.60 – 158.60

Figure 2: Boreholes containing basic geotechnical logs

Table 2 summarises the relevant core photographs that were located. Figure 3 illustrates the borehole locations and the existing pit.

Table 2: Boreholes with core photographs

Borehole	Interval (m)
TH063D	0.00 – 96.20
TH064D	3.05 – 51.10
TH065D	0.00 – 78.10
TH066D	0.00 – 46.00

Also collected were a joint analysis (Hood, date unknown) and a photo album with historical open pit photographs.

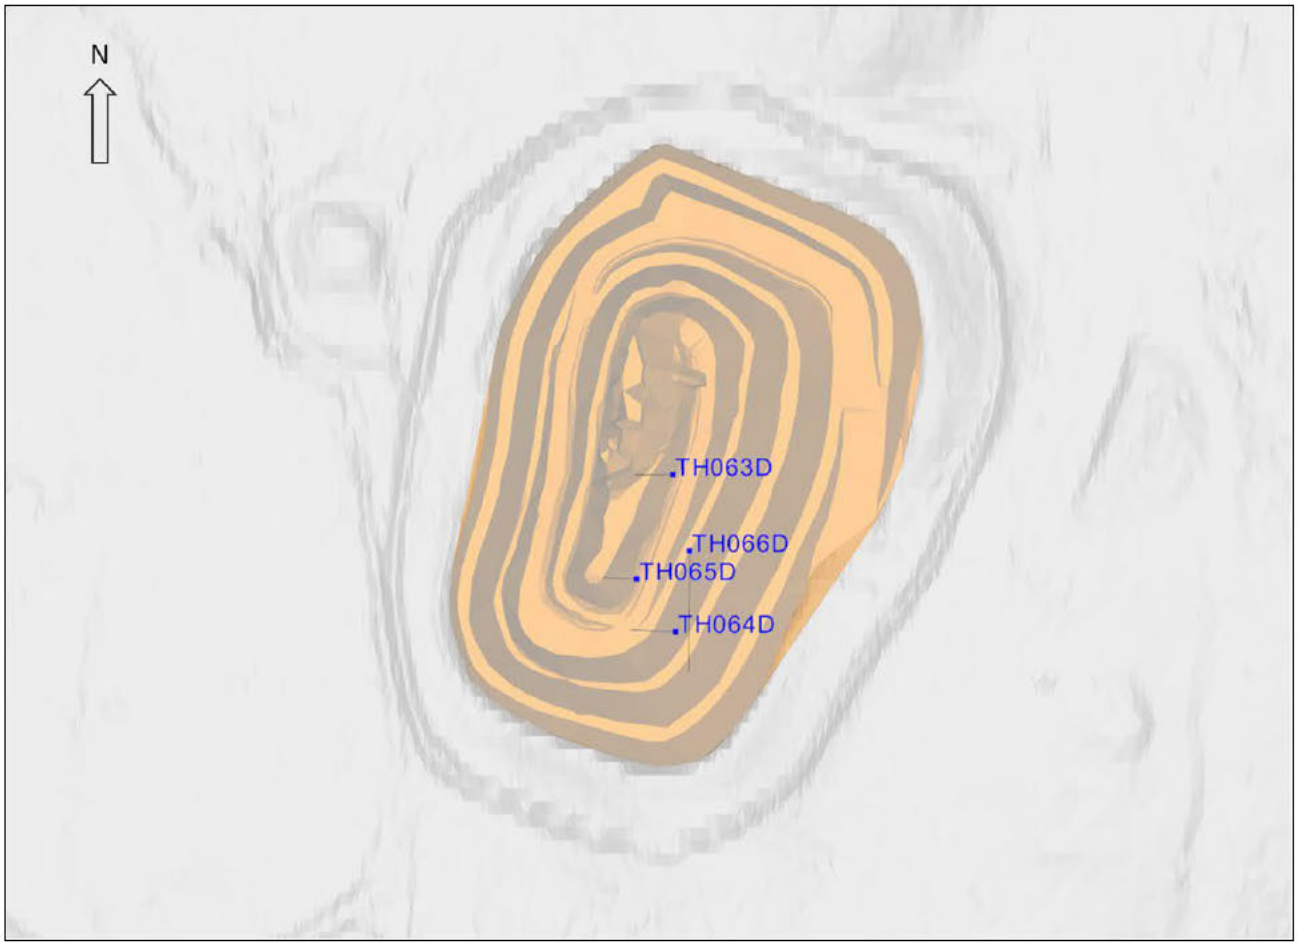

Figure 3: Boreholes containing core photography

3.2 Geological and Structural Model

Table 3 summarises the geological and structural model files supplied. No fault model was supplied.

Table 3: Geological and structure model files

File	Description
base_ox.dxf	Base of Oxidation/Weathering surface
fw_qtz_biotite_granofels_domain.dxf	Footwall Quartz-Biotite Granofels interlayered with Biotite Schists
fw_quartzite.dxf	Footwall Quartzite
hw_amphibolite_calcsilicate_domain.dxf	Hangingwall Amphibolite interlayered with calcsilicates
hw_quartzite.dxf	Hangingwall Quartzite
laminite.dxf	Laminite (host lithology of orebody)
Carnaby_Holes_Oriented_Structures.xlsx	Database of logged structures in eight Carnaby drilled boreholes

3.3 Current Topography, Mine Design and Other Items

Table 4 summarises the model files supplied for the current topography, existing pit (after crown pillar extraction), [redacted], water table, underground workings and west wall slip.

[redacted]

Table 4: Topography, mine design and other files

File	Description
final_topo_excluding_final_pit.dxf	Topography surrounding final pit
pit_floor_after_crown_removal.dxf	Open pit after crown pillar extraction
[redacted]	[redacted]
water_table.dxf	Water table surface
final_dev_solid.dxf	Solids of underground drill and extraction drives
final_full_workings_string_file.dxf	Strings of decline, all underground drives, ventilation shaft and stopes
final_hw_stope_solid.dxf	Hangingwall stope solid
final_main_lode_stope_solid	Main lode stope solid
solid_crown_pillar_remnant_resource.dxf	Orebody with the crown pillar that formed the hangingwall and main lode stope
potential_slip_zone.dxf	Potential slip zone caused by crown pillar extraction

[redacted]

[redacted]

4 GEOLOGY

The Tick Hill gold deposit is hosted in the Middle Proterozoic Corella Formation, locally made up of banded calc-silicates quartzites and amphibolites (Figure 5). Originally these were sediments of evaporitic, detrital and possibly igneous (tuffs) origin, that have now metamorphosed to mid-amphibolite facies.

The sequence has undergone regional deformation, leading to mylonitization, phases of silicification plus retrogressive and metasomatic alteration.

An estimated 90% of the gold mineralisation occurs in a highly strained quartz-feldspar laminite, with the remainder occurring in the surrounding quartzitic schists and amphibolites. The quartz-feldspar laminites vary in width from 1 cm to 150 cm and often carry visible grains of gold up to 2 mm in size. Individual bands show strong lateral continuity both along strike and up and down dip. The orebody contains virtually no accessory or pathfinder minerals, with only very minor pyrite and trace chalcopyrite.

The host rocks strike roughly north-south and dip to the west at about 55°. The orebody is situated on the eastern limb of a well-defined synformal structure, with the sub vertical fold axis striking north south and plunging gently to the north (MIM 1993).

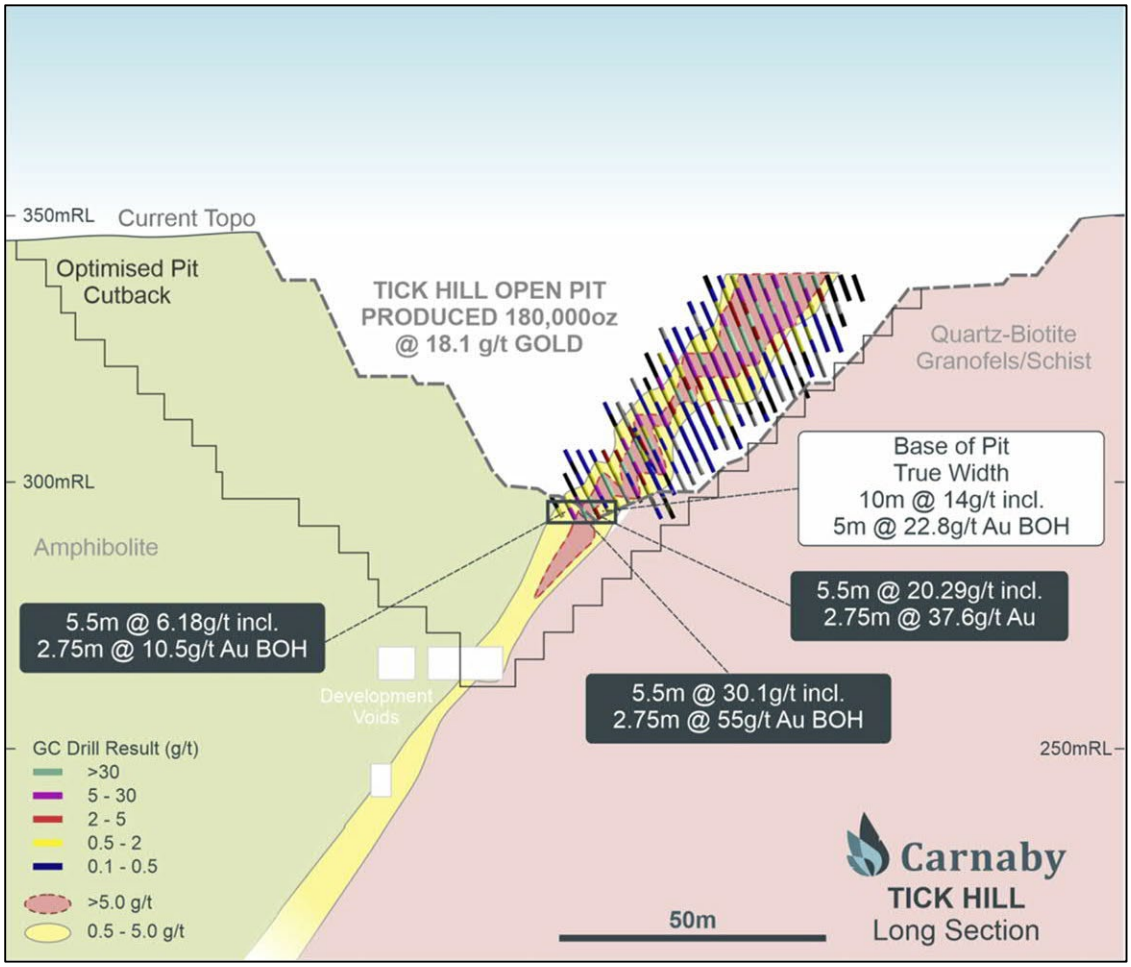

Figure 5: Tick Hill long section (Carnaby 2020)

5 GEOTECHNICAL MODEL

Table 1 and Table 2 summarise the historical geotechnical available to WKG.

On the 7th May 2020 WKG visited the Tick Hill Mine site to inspect core from available boreholes, conduct a site inspection of the existing pit, undertake structural mapping of accessible areas and a general inspection of the tailings dam.

5.1 Historical Paper Logs

The 11 boreholes in Table 1 were scanned and the data transcribed into an Excel spreadsheet.

The logs recorded information such as:

- Rock Type
- Weathering
- Rock Strength
- Bedding Foliation
- CBA
- Core Loss
- Rock Quality Designation (RQD)
- Remarks on shear zones, jointing etc.

In general, the logging was undertaken consistently with minor differences. Table 5 summarises the data collected for each hole.

Fracture frequency was logged with the following boreholes:

- TH040RD (detailed information in the remarks)
- TH045RD (the Rock Type field replaced with Fractures per Metre)
- TH075RD (fracture frequency noted in Remarks)
- TH077RD (dedicated Fractures per Metre field).

Discontinuity shape/roughness and alteration/infill was not logged in any of the boreholes.

RQD generally agreed with comments regarding shear zones or core loss, i.e. lower RQD was assigned to intervals with these features.

It was noted that weathering varied down hole. It is possible that the loggers were confusing weathering with alteration.

Codes and explanatory notes for bedding/foliation and CBA were not found so these parameters were not examined further.

Table 5: Information in historical paper logs

Borehole	Rock Type	Weathering	Rock Strength	Bedding/ Foliation	CBA	Coreloss	RQD
TH007RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH010RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH021RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH023RD	No	Yes	Yes	Yes	Yes	Yes	Yes
TH024D	No	Yes	Yes	Yes	Yes	Yes	Yes
TH025D	No	Yes	Yes	Yes	Yes	Yes	Yes
TH040RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH041RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH045RD	No	Yes	Yes	Yes	Yes	Yes	Yes
TH075RD	Yes	Yes	Yes	Yes	Yes	Yes	Yes
TH077RD	No	Yes	Yes	Yes	Yes	Yes	Yes

Due to the age of the paper logs, some sections were difficult to read and were not included in the geotechnical model.

The scanned logs can be found in Appendix A.

5.2 Core Photos

The four boreholes in Table 2 were logged by WKG visually for RQD and Fracture Frequency. The logs can be found in Appendix B.

5.3 Boreholes

From the 11 boreholes listed in Table 1, five were located in the core yard (Table 6) and structural characteristics (type, infill thickness, roughness, surface weathering and joint alteration/infill) re-logged.

Strength and RQD could not be logged as the cores were split.

The logs can be found in Appendix C.

Table 6: Boreholes re-logged for structure characteristics

Borehole	Interval (m)
TH002D	15.00 – 49.90
TH023RD	48.10 – 159.00
TH045RD	84.40 – 125.90
TH075RD	101.80 – 165.00
TH077RD	93.90 – 158.60

Figure 6 is an illustration of the boreholes that contain data used in the development of the geotechnical model.

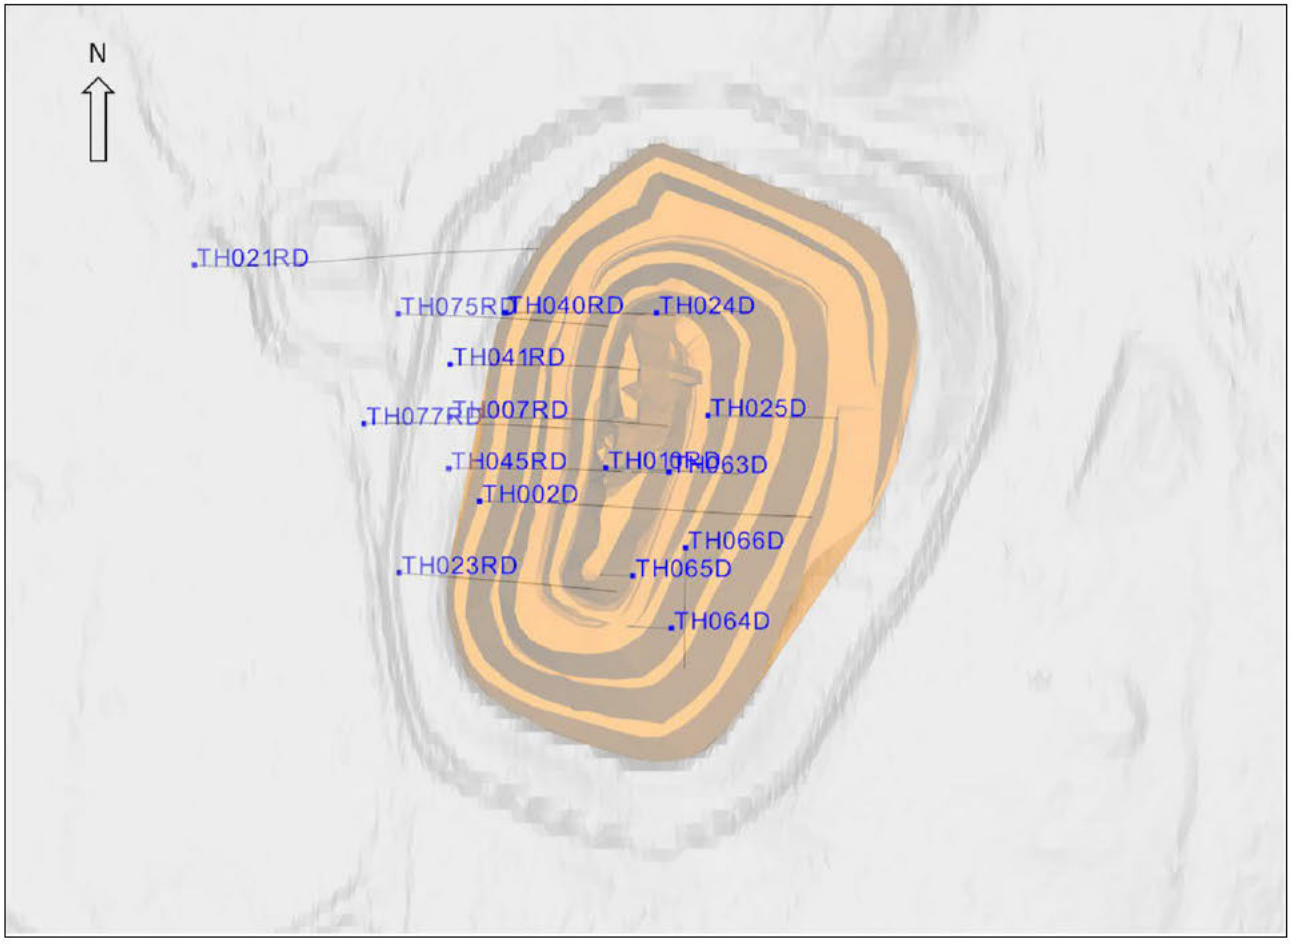

Figure 6: Boreholes used in geotechnical model development

The geotechnical data was compiled and domained using the supplied geological model (see Table 3).

[redacted]

[redacted]

5.4 Geotechnical Domains

The deposit has been divided into six geotechnical domains (Table 7) on the basis of the geology model and weathering state.

Table 7: Geotechnical domains

Domain	Code
[redacted] Amphibolite Calcsilicates Fresh	HW_AMP_CALC_F
[redacted] Amphibolite Calcsilicates Weathered	HW_AMP_CALC_W
[redacted] Quartzite Fresh	HW_QTZ_F
[redacted] Quartzite Biotite Granofels Fresh	FW_QTZ_BIO_GRAN_F
[redacted] Quartzite Fresh	FW_QTZ_F
Laminite Fresh	LAM_F

For the purpose of this assessment, WKG has assumed the unit weight of all domains to be 26 kN/m^3.

Rock mass classifications of the geotechnical domains has been determined using the Geological Strength Index (GSI), which is a function of:

- The degree of fracturing and "blockiness" of the rock mass
- The defect characteristics (surface roughness and infill material)
- The compressive strength of the intact rock material.

The GSI values for each geotechnical domain are presented in Table 8.

Table 8: Design GSI

Domain	UCS (MPa)	RQD (%)	GSI	GSI
HW_AMP_CALC_F	75	70	55	Fair rock
HW_AMP_CALC_W	75	44	53	Fair rock

5.5 Structural Mapping

A structural model for Tick Hill was provided to WKG. [redacted] Figure 8 is an example of the typical structure exposed in the northern wall. WKG's observations are in accordance with the structural model, a regional shear fabric dominates the rock mass and dips at moderate to steep angles to the west. A joint set steeply dipping to the south was also identified. The majority of defects observed by WKG were planar smooth to planar rough in shape.

Discontinuities are discussed in further detail in Section 6.3.

Figure 8: Typical north wall structure

5.6 Pit Inspection

WKG inspected the pit crest and accessible areas of the existing pit.

In general, the pit appears to be in good condition given the duration of exposure, with little erosional or weathering effects. This is a good indication of a reasonably high quality rock mass (Figure 9 and Figure 10).

The pit floor is under water, the level of which can be considered the regional water table level.

A section of the west wall ramp has failed into the pit and the west wall has slipped (Figure 11) however this was most likely due to the crown pillar extraction. The backscarp of the failure extends behind the west wall crest and has been cordoned off. A tell-tale has been established behind the crest. Movement of approximately 1 cm has been recorded (Figure 12) however it is unknown when the tell-tale was established.

A small section on the east wall has failed with a sliding/buckling slab mechanism (Figure 13) however no other major failures were noted.

Catch berms contain rilled material which is to be expected, however the amounts are not significant.

Figure 9: Tick Hill Pit looking north

Figure 10: Tick Hill Pit looking south

Figure 11: Western wall and ramp failure

Figure 12: Tell-tale established behind west wall crest

Figure 13: Sliding/buckling slab failure on East wall

6 GEOTECHNICAL DESIGN STUDIES

6.1 Pit Design

[redacted]

6.1.1 Current Pit

Approximate slope dimensions of the current pit are summarised in Table 9. Batter heights are <10 m for the initial batter in highly weathered material, 20 m in fresh rock materials.

Table 9: Current pit slope dimensions

Pit Wall	Batter Face Angle (°)	Berm Width (m)	Overall Slope Angle (°, including ramp)
West, North and South	65	4.0	52.5
East	56	5.0	44.0

6.1.2 [redacted]

6.3 Geotechnical Analysis Model

6.3.1 Discontinuity Model

Structural discontinuity orientation data sets collected by MIM and by WKG during this study have been combined and reviewed to identify the principal structural sets within the Tick Hill units that will influence wall stability. The discontinuity model adopted for the kinematic stability analyses is summarised in Table 11.

Table 11: Tick Hill structural sets

Structural Set	Mean Orientation (Dip / Dip Direction,°)	Variability (°)	Persistence (m)
Bedding	55/280	± 10	> 50
Joint Set 1 (J1)	40/080	± 10	HW < 5 FW < 30
Joint Set 2 (J2)	90/170	± 10	< 10

Only one fault structure has been observed in the current pit walls; this feature daylights on the southern section of the west wall and is orientated approximately 80°/350°, near perpendicular in strike to the wall.

6.3.2 Discontinuity Strength Parameters

Shear strength parameters for in-situ bedding surfaces were developed using the Barton-Bandis methodology. Surface characteristic parameters for this process were derived from mapping data and from inspection of photographs of the pit walls. A "Basic Friction Angle" of 32° was assumed for the granofels and amphibolite units, based on literature values for similar rock types. Results are summarised in Table 12.

Table 12: Discontinuity strength parameters

Material	Surface Characteristics	JRC	Cohesion (kPa)	Friction Angle (°)
FW Granofels	Slightly Wavy; Undulating Smooth to Slightly Rough	11	21.5	56.2
HW Amphibolite	Slightly Wavy; Undulating Rough to Very Rough	14	136.0	59.6

6.3.3 Rock Mass Strength Parameters

Rock-mass strength and constitutive parameters were developed using the Hoek-Brown model. Equivalent Mohr-Coulomb strength parameters were derived from these for use with anisotropic strength models in the limit equilibrium analyses and where tensile stresses were likely to occur in the finite element models. The parameters are summarised in Table 13.

For the finite element analyses, the materials were assumed to be elastic-plastic with residual strength parameters equal to peak strengths.

Table 13: Rock mass strength parameters

Material	UCS (MPa)	GSI	mi	Unit Weight (kN/m³)	Cohesion (kPa)	Friction Angle (°)	E Rock Mass (GPa)	v	Rock Mass Tensile[2] (MPa)
Fresh FW Granofels	75	55	20	26	1151	56	13.0	0.3	-0.25
Fresh FW Quartzite	75	53	20	26	1092	56	10.3	0.3	-0.22
Fresh HW Amphibolite	75	58	26	26	1280	59	16.0	0.3	-0.25
Weathered Rock	37.5	32	26	26	572	47	1.6	0.3	-0.02
Fresh HW Quartzite	175	57	26	26	2025	61	29.7	0.3	-0.7
Fresh Laminite	75	64	26	26	1519	58	11.4	0.3	-0.5
Rockfill				20	10	35	0.1	0.3	0

6.3.4 In-Situ Stress Model

The in-situ stress model adopted for the finite element analyses is based on the Mt Isa regional model and is summarised in Table 14.

Table 14: In-situ stress model

Principal Stress	Magnitude (MPa)	Orientation
Major	1.6 x Depth x 0.026	Horizontal E-W
Intermediate	Depth x 0.026	Vertical
Minor	Depth x 0.026	Horizontal N-S

[2] *Rock Mass Tensile Strengths used in this work are 2x Hoek-Brown estimates, based on industry recognition that this underestimates rock mass strengths at very low confining stress.*

Logging Codes

Micro Roughness

Code	Description
PP	Planar - Polished
PS	Planar - Smooth
PR	Planar - Rough
UP	Undulating - Polished
US	Undulating - Smooth
UR	Undulating - Rough
SP	Stepped - Polished
SS	Stepped - Smooth
SI	Stepped - Irregular

Infill Thickness

Code	Description
0	Tight, Zero
1	Less than 1mm
5	Between 1 and 5mm
6	Greater than 5mm

Surface Weathering

Code	Term	Description
CW	Completely Weathered	Rock exhibits soil like properties (i.e. can be remoulded).
HW	Highly Weathered	Limonite staining/bleaching and other signs of chemical decomposition evident. Porosity & strength may be increased or decreased. Colour & strength of original fresh rock no longer recognisable
MW	Moderately Weathered	Defect surface affected by weathering to extent that staining extends across complete surface and the original colour of the fresh rock is no longer recognisable.
SW	Slightly Weathered	Staining or discolouration of defect surface, usually limonite, colour & texture of fresh rock recognisable.
F	Fresh	Defect surface unaffected by weathering.

Joint Alteration/Infill

Code		Description	
A		Coatings only, rock contact	Tightly healed, hard, non softening, impermeable filling, e.g. quartz, carbonate, epidote.
B			Unaltered/Fresh joint walls, or surface staining only
C			Slightly altered joint walls (one grade higher than intact rock). Non softening mineral coatings, sandy particles, clay free disintegrated rock
D			Silty-clay or sandy-clay coatings, small clay fraction, non softening.
E			Altered joint walls (two grades higher than intact rock). Softening or low friction clay mineral coatings, i.e. kaolinite, mica, chlorite, talc, gypsum, graphite.
<5mm	>5mm	Filled joints, no wall contact	Friction materials. Sandy particles, clay free, disintegrated rock
F1	F2		
G1	G2		Hard cohesive materials. Strongly over-consolidated, non-softening clay
H1	H2		Soft cohesive materials. Medium to low over-consolidated, softening clay
J1	J2		Swelling clays, e.g. montmorillonite
