Project number:	BC200153.03

1 INTRODUCTION

CS Energy Limited (CS Energy) currently operate the Callide Power Station (CPS) site, located approximately 9 km north-east of Biloela, Queensland. Following release of the Queensland Department of Environmental Sciences' (DES's) Operational Policy for the management of firefighting foam in 2016, CS Energy undertook a review of site operations and identified historical use of per- and poly-fluoroalkyl substances (PFAS). This review identified former storage and use of non-compliant and persistent Aqueous film forming foams (AFFF) at the site. Removal of all non-compliant AFFF commenced in late 2018, with all non-compliant AFFF removed from service and disposed to a licensed disposal facility.

Following removal of non-compliant AFFF, CS Energy committed to DES to undertake a voluntary PFAS Environmental Investigation, to assess potential impacts associated with the former use of PFAS containing products at the site. Epic Environmental (Epic) was engaged by CS Energy to undertake assessment of per- and poly-fluoroalkyl substances (PFAS) at CPS as part of this voluntary investigation. Under the voluntary arrangement, CS Energy also submitted an initial monitoring plan to DES and continue to operate in accordance with it.

Initial investigations completed at the site in 2019 targeted existing onsite and offsite environmental monitoring locations, with the investigation expanded during 2020 and 2021 to include sampling of private groundwater supply wells up to 10 km downstream of the site. To date, a total of 158 groundwater monitoring bores and 50 surface water monitoring locations have been sampled, with results from monitoring completed to date reporting concentrations of Sum of PFOS and PFHxS above the Australian Drinking Water Guideline (0.07 µg/L Sum of PFOS and PFHxS) in onsite and offsite groundwater monitoring wells (Sum of PFOS and PFHxS up to 3.73 µg/L and 6.11 µg/L respectively) and onsite and offsite surface water (Sum of PFOS and PFHxS up to 0.481 µg/L and 0.244 µg/L respectively). All results from sampling completed to date have been provided to DES and the Contaminated Land Auditor.

A Notice to conduct or commission an Environmental Evaluation (EE) notice (Reference: EPPR00536313 | CCPLRC-100046232 | E-100046349, dated 15 December 2021) was formally issued by DES requiring CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site.

A site investigation was completed in accordance with the requirements of the EE, with a contaminated land investigation document (CLID (Epic, 2022c)) submitted to DES on 7 September 2022 in accordance with EE Requirement 5. The report detailed findings of site investigations, remaining data gaps identified, and provided recommendations in accordance with EE Requirements 5(e) and 5(f).

Correspondence received from DES on 4 October 2022 requested that further works be completed to address data gaps identified in the CLID (Epic, 2022c), with the original EE amended (amended notice issued 4 October 2022) to allow further investigation to be completed to address the identified data gaps with the final environmental report required by 5:00pm on 13 October 2023.

This addendum SAQP has been prepared to address the previously identified data gaps, which are discussed further in **Section 1.1**. It is intended that this SAQP will be used to supplement ongoing works on the site as detailed in the previously prepared SAQP (Epic, 2022b).

1.1 EE Requirements

Details of requirements for preparation of a sampling analysis and quality plan (SAQP) are outlined in EE Requirement 3, as summarised in **Table 1**.

Table 1. EE E-100046349 Requirement 3

Item	EE E-100046349 Requirements (Section B)
3	By **5:00 pm on 28 February 2022** you must develop and submit a sampling, analysis and quality plan (SAQP) to the department to characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises for the purpose of preparing a site investigation report as defined in section 387 of the Act. This plan must be prepared by a SQP and consented to by a contaminated land auditor. This investigation detailed in the SAQP must, as a minimum:
3(a)	evaluate the nature and extent of PFAS contamination likely to have been caused by any direct or indirect release of AFFF from the premises to soil, water, groundwater, sediments and, include biota sampling in Callide Creek adjoining the premises as part of the investigation; and
3(b)	assess likely pathways of PFAS contamination from the release of AFFF from the premises including, but not limited to, the premises, surface waters, drainage lines, stormwater infrastructure and groundwater in the vicinity of the premises; and
3(c)	assess the nature of the connectivity/completeness of those likely pathways by, assessing (where applicable) groundwater levels versus surface water levels and connectivity, hydraulic conductivity and groundwater velocity, and evaluate the potential for surface water releases from Callide dam to enhance migration of PFAS contaminants from the site.
3(d)	the sampling analysis must be generally in accordance with all requirements stated in Requirement 7.

1.2 Document Structure and Purpose

The purpose of this Addendum SAQP is to detail the works required to be completed to address data gaps identified at the site as part of the investigation detailed in the CLID (Epic, 2022c). Background information related to the site and previous investigations are detailed in the CLID for the site (Epic, 2022c) and should be read in conjunction with this document.

It is noted that additional information and data collected through the implementation of this Addendum SAQP will be used in conjunction with other scopes (**Section** 4) to develop an updated CLID to address EE requirements (as required).

A summary of identified data gaps is detailed in **Table 2**, with further details on data gaps and additional works proposed to be completed detailed in **Section 4**.

Table 2. Identified Data Gaps (Epic, 2022c)

Data Gap	Details
1	Results from soil and sediment investigations at Ash Dam 4 (AD4) indicate that a localised source of PFAS may be present within AD4. Further investigation will be required to determine the nature and extent of potential impacts at AD4.
2	Soil investigations completed at Callide A indicate a localised PFAS impact may be present within the catchment of the Northern Stormwater Pond (NSP), with elevated concentrations of PFAS reported in soils (coal ash/dust) within the northern sediment pond along with surface water. Further investigation will be required to determine the nature and extent of potential impacts at the Callide A NSP.
3	PFAS is reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations, noting limited water is released via R2 and PFAS impacts were also reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine). No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A, with PFAS reported at R2 likely associated with soil impacts identified at the NSP. Further investigation will be required to confirm the source and associated migration pathways of PFAS reported within R2.
4	Groundwater results indicate that the eastern seepage area likely comprises at least two seepage pathways, one associated with the current seepage pathway and seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32. Further investigation will be required to confirm the nature and extent of seepage pathways at the eastern seepage area.
5	Groundwater results from the western seepage area indicate some wells, including MW49, may be outside the current groundwater seepage recovery area. In addition, surface water within the western stormwater diversion channel (carrying stormwater from the north) may infiltrate through alluvial soils

Data Gap	Details
	in the south-western portion of the site, potentially contributing to PFAS impacts in groundwater. Further investigation will be required to confirm the nature and extent of seepage pathways at the western seepage area along with potential contribution from surface water infiltration.
6	High concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and western stormwater diversion channels. Further investigation will be required to assess the nature (including mass) of PFAS entering the site via these pathways. It is noted that management of PFAS impacts from these pathways will need to be undertaken in conjunction with remediation and/or management of offsite source areas.
7	Potential risks to human and ecological health have been identified (refer EE CLID Sections 12.2 and 12.3 respectively). Further assessment of risk will be required to be completed to quantify potential risks to human and ecological receptors. It is noted that biota sampling was presented as Appendix E to the EE CLID.

1.3 Roles and Responsibilities

Epic was engaged by CS Energy to perform the function of a SQP in accordance with the requirements of the EE. The key roles relating to the project have been summarised in **Table 3** below.

Table 3. Key Roles

Aspect	Details
Suitably Qualified Person (SQP)	Mr Luke Amies Epic Environmental Pty Ltd Completion of environmental investigations and reporting requirements of the EE
Contaminated Land Auditor (CLA)	Mr Mark Stuckey Environmental Earth Sciences Oversee SQP carrying out the requirements of the EE and undertake an Auditor's Function in accordance with Section 568(b) of the Environmental Protection Act 1994.
Recipient / Site Owner	CS Energy Limited Level 2, HQ (North Tower) 540 Wickham Street Fortitude Valley QLD 4006 Commissioning of and compliance with requirements of the EE

2 SITE IDENTIFICATION

The site consists of three coal fired power stations; Callide A, Callide B and Callide C. Callide A Power Station was constructed in 1965, operating up until 1988 when Callide B Power Station was commissioned and supplemented with the addition of Callide C Power Station which was commissioned in 2001. Callide A Power Station was retrofitted to trial low emission coal-fired (oxyfuel trial) power generation between 2012 and 2015. Both Callide B and Callide C continue to operate.

The current combined generation capacity of site (Callide B and Callide C Power Stations) is 1,532 MW with site operations managed under Environmental Authorities EPPR00536313 (Callide A and B) and EPPR00707213 (Callide C) in addition to the internal CS Energy Environmental Management System. Callide B and C manage ash and water internally within the adjacent Waste Containment Facility (WCF) located immediately east of Callide B and C (**Figure F1**).

The site occupies two land parcels located at Biloela Callide Road, Mount Murchinson as outlined in **Table 4.** The operational areas of the power station are split between the two lots, with the majority of the WCF located within Lot 1 RP615528 as shown in **Figure 1** and site features in **Figure F1**.

3 BACKGROUND AND CSM SUMMARY (EPIC, 2022C)

Details on the site history, background information, environmental setting and detailed Conceptual Site Model (CSM) are presented in the EE SAQP (Epic, 2022b) and the previously submitted CLID (Epic, 2022c). A summary of investigation findings and key CSM elements associated with identified data gaps are summarised in **Table 5**, with a summary of source-pathway-receptor linkages detailed in **Section 3.1**.

Table 5. Summary of Data Gaps and CSM Elements (Epic, 2022c)

Data Gap		CLID Investigation Findings/CSM Elements
1	Results from soil and sediment investigations at AD4 indicate that a localised source of PFAS may be present within AD4. Further investigation will be required to determine the nature and extent of potential impacts at AD4.	• One of the samples collected at AD4 (AD401-0.5) reported concentrations of PFAS above the ecological indirect criteria of 0.01 mg/kg. It is understood that areas of AD4 adjacent to bore AD401 are used to dispose road sweeping and vacuum excavation spoil, with PFAS concentrations likely to be associated with disposal of other materials/wastes rather than impacts. Sediment samples collected adjacent to AD4 (refer above) indicate that a localised source of PFAS may be present within AD4. Based on the results of soil and sediment sampling, a localised source area is likely present in the northern portion of AD4. • Sediment investigations at AD4 reported an increase in PFAS concentrations compared with upstream samples from areas surrounding the Coal Stockpile/Coal Plant. All results were reported below the adopted assessment criteria for soil, however results indicate that a localised source of PFAS may be present within AD4. Soil investigation completed in the north-eastern corner of AD4 reported concentrations of PFAS (Sum of PFOS and PFHxS of 0.0155 mg/kg) above the adopted assessment criteria of 0.01 mg/kg, however the composition of PFAS is not consistent with sediment samples and another source may be present. It is noted that overland flow from the waste oil store and western areas of the Coal Plant can drain towards the drains surrounding AD4.
2	Soil investigations completed at Callide A indicate a localised PFAS impact may be present within the catchment of the NSP, with elevated concentrations of PFAS reported in soils (coal ash/dust) within the northern sediment pond along with surface water. Further investigation will be required to determine the nature and extent of potential impacts at the Callide A NSP	• Callide A is unlikely to comprise a primary source area, with the majority of samples reported below the laboratory's LOR and/or the adopted assessment criteria. One location (CA15) within the NSP reported concentrations of PFOS above the ecological indirect criteria of 0.01 mg/kg, representing layers of coal ash/dust approximately 1.0 m deep. It is assumed that the sample represents sediment runoff from the adjacent coal stockpile and coal hopper (decommissioned in 1988), however other locations collected within these area (CA12, CA13 and CA14) reported concentrations below the laboratory's LOR. It is likely that PFAS impacts identified in the NSP are associated with the use of a portable foam-type extinguisher in the station (observed at extinguisher stations throughout the station) or the use of AFFF on coal stockpiles, with a localised PFAS impact present within the catchment of the NSP.
3	PFAS is reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations, noting limited water is released via R2 and PFAS impacts were also reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine). No PFAS was identified in ash	• PFAS is reported to be present in Dunn Creek (total PFAS up to 0.244 µg/L at SW18), with results indicating that concentrations are likely to be associated with discharges from the Callide A site (via release point R2, noting limited water is released via R2) combined with upstream sources, with PFAS impacts reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine) at SW18. In general, concentrations were higher in upstream surface water. No PFAS was identified in ash (soil samples) within Ash Dam 2, however PFAS was identified in surface water (total

Data Gap		CLID Investigation Findings/CSM Elements
	(soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A, with PFAS reported at R2 likely associated with soil impacts identified at the NSP. Further investigation will be required to confirm the source of PFAS reported within R2.	PFAS up to 0.0561 µg/L) and soil (total PFAS up to 0.0655 mg/kg) in the NSP, with PFAS reported at R2 (total PFAS up to 0.202 µg/L) likely associated with these impacts. • Samples from Callide Dam (downstream of Dunn Creek) all reported concentrations of PFAS below the LOR, however the LOR was raised in the majority of samples due to suspended solids.
4	Groundwater results indicate that the eastern seepage area likely comprises at least two seepage pathways, one associated with the current seepage pathway and seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32. Further investigation will be required to confirm the nature and extent of seepage pathways at the eastern seepage area.	• Groundwater results for the eastern seepage area report significant differences in both concentration and composition between onsite wells (MW11, ESC1, ESC3, ESC4, total PFAS up to 0.859 µg/L) and offsite wells (MW31, MW32, MW33 and MW43, total PFAS up to 9.850 ug/L). It is likely that the eastern seepage area comprises at least two seepage pathways, one associated with the current seepage pathway/seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32.
5	Groundwater results from the western seepage area indicate some wells, including MW49, may be outside the current groundwater seepage recovery area. In addition, surface water within the western stormwater diversion channel (carrying stormwater from the north) may infiltrate through alluvial soils in the south-western portion of the site, potentially contributing to PFAS impacts in groundwater. Further investigation will be required to confirm the nature and extent of seepage pathways at the western seepage area along with potential contribution from surface water infiltration.	• Groundwater results from the western seepage area reported PFAS composition to be relatively comparable across all monitoring wells, with MW49 reporting a greater proportion of PFHxS and highest concentrations (total PFAS up to 4.67 µg/L, approximately one order of magnitude higher than other wells [total PFAS between 0.22 – 1.01 ug/L]). • It is likely that surface water within the Western Stormwater Diversion Channel infiltrates through shallow alluvial soils in the southern portion of the site, however current results indicate this is unlikely to be cause of elevated concentrations within MW49. These elevated concentrations may be due to this location being outside of the current groundwater seepage capture area.
6	High concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and western stormwater diversion channels. Further investigation will be required to assess the nature (including mass) of PFAS entering the site via these pathways. It is noted that management of PFAS impacts from these pathways will need to be undertaken in conjunction with remediation and/or management of offsite source areas.	• Groundwater results for background monitoring wells located along the northern (hydraulically upgradient) boundary indicate that groundwater located along the northern site boundary (as represented by MW01 and MW74) is likely to have been impacted from surface water entering the northern site boundary from the area of the mine (operated by Batchfire), which has reported elevated concentrations of PFAS (including SW34 and SW33). It is noted that based on the topography of areas north of the site, groundwater impacts may be localised to areas along the northern site boundary where surface water pools following flow events, with features including the railway line providing a constriction to surface water flows. • PFAS is reported to be entering the site along the northern site boundary from the area of the mine (operated by Batchfire) via SW33, SW34 and SW45 at concentrations up to 6.62 µg/L total PFAS, exceeding the 95% species protection limit (0.13 µg/L PFOS) and the drinking water criteria (0.07 µg/L Sum of PFOS and PFHxS). Once surface water has entered the site it is observed to flow along the NSDC and WSDC and discharge to Callide Creek via SW28. Concentrations of PFAS at the point of discharge (SW28, total

Data Gap		CLID Investigation Findings/CSM Elements
		PFAS up to 0.39 µg/L) are considerably lower than those at the northern site boundary (up to 6.62 µg/L at SW34), with concentrations of PFOS exceeding the 99% species protection limit. Sediment sampling along the NSDC (refer below) indicate approximately 1.0 – 1.5 km of sediments within the NSDC, commencing at SW34 and continuing to between NSDC2 (1.0 km) and NSDC3 (1.5 km) has been impacted by PFAS contaminated surface water entering the site along the northern site boundary (see **Figure F2**). • Results from sediment investigations indicate sediments within the NSDC, commencing at SW34 and continuing to between NSDC2 (1.0 km) and NSDC3 (1.5 km) have been impacted by PFAS contaminated surface water entering the site along the northern site boundary. Beyond 1.5km (sample NSDC3) impacts associated with offsite sources is no longer observed. Sediment impacts remain along the length of the NSDC and WSDC, which may be associated with the offsite impacts noted above, however there is insufficient evidence to indicate whether the site may be contributing, or has historically contributed to PFAS concentrations with the stormwater diversion channels. Concentrations of PFAS were also reported in sample SW45 (north-eastern portion) and SW38 (north-western portion) which may indicate additional minor PFAS impacts from upgradient areas (see **Figure F4**).
7	Potential risks to human and ecological health have been identified (refer EE CLID Sections 12.2 and 12.3 respectively). Further assessment of risk will be required to be completed to quantify potential risks to human and ecological receptors.	• It is noted that biota sampling was presented as Appendix E to the EE CLID.

3.1 Source-Pathway-Receptor Model

A summary of source, pathway and receptor linkages detailed as part of the EE CLID are detailed in **Table 6**.

Table 6. Summary of Pathway and Receptor Linkages (Epic, 2022c)

Source	Migration Pathways	Receptor(s)	Considerations / Comments
Onsite Migration Pathways – Callide B and C	The primary onsite pathways for migration of PFAS from source areas at Callide B and C are via surface water flows through onsite drainage and overland flow to the DRD and ultimately to Ash Dam B (EMS 2022). Results indicate surface water within the DRD and ADB are generally comparable. Once within Ash Dam B, pathways for PFAS migration include: • Circulation within Ash Dam B via movement of surface water and operational water uses (i.e. dust suppression, ash watering) • Adsorb to ash, sediments and soils within Ash Dam B, although limited PFAS has been identified in ash disposal areas • Infiltrate to groundwater and discharge via deep seepage (approximately 75% recovered and returned to Ash Dam B) • Discharge via shallow seepage (collected as surface water in seepage collection trenches and returned to Ash Dam B) • Licenced stormwater discharges (occasional). The estimates of deeper seepage recovered and fugitive seepage from Ash Dam B to Callide Creek are 558 m^3/day and 188 m^3/day respectively (EMS 2022), equating to successful recovery of approximately 75% of deeper seepage. It is estimated that the mass of PFAS within water contained within Ash Dam B is between 0.15 kg to 0.6 kg, with the mass of PFAS in fugitive seepage (not recovered) currently estimated to be approximately 0.01 kg per year (EMS 2022). Surface water entering the site from the direction of the mine, located upgradient (north) of the site was reported to contain elevated concentrations of PFAS. Upgradient water is diverted around the northern and western boundaries of Ash Dam B via the Western Stormwater Diversion Channel. During large rainfall	The receptors associated with the migration pathways in Callide B and C include: • Dermal contact, inhalation or ingestion exposure pathway to site workers operating in areas impacted by PFAS (soil or water) • Plant uptake associated with ecological receptors of current and future revegetated areas (including rehabilitated areas) • Exposure of migratory birds and other transient fauna interacting with the environs of the waste containment facility including the Western Stormwater Diversion Channel	• The risk to site users is considered relatively low based upon the operational conditions and controls required for workers interacting with impacted soils and waters • The current high salinity of the major water bodies onsite (Ash Dam B and Borrow Pits A and B) is likely to preclude consumption or plant uptake pathways associated with ecological (flora and fauna receptors)

Source	Migration Pathways	Receptor(s)	Considerations / Comments
	events, surface water diverted around the site will discharge directly to Callide Creek, with some water retained within the diversion channel. During smaller rainfall events, surface water may be retained within the diversion channel. Water retained within the diversion channel in the southwestern corner of the site is anticipated to infiltrate to groundwater through alluvial soils and eventually the Callide Creek alluvium (EMS 2022), although current results indicate this is unlikely to be a significant source of PFAS impacts in groundwater. A generalised CSM for Callide A and a detailed CSM for the investigation are included in Appendix G of the EE CLID.		
Onsite Migration Pathways – Callide A	The primary onsite pathways for migration of PFAS at Callide A is via surface water flows which are directed to the eastern and NSPs (located upstream of the Ash Dam 2 catchment). Sediment comprising coal ash/dust observed in the NSP reported elevated concentrations of PFAS, indicating possible migration of PFAS via transport of sediment from the coal stockpile. Release of water is authorised under CS Energy's Environmental Authority at Release Point R2, located at the toe of Ash Dam 2. Releases discharge directly into Dunn Creek. PFAS has been detected in surface water within the eastern and NSPs (up to 0.0130 µg/L and 0.0561 µg/L total PFAS respectively), along with water at release point R2 (0.0053 – 0.2020 µg/L total PFAS). Surface water from areas upgradient (north) of Callide A are directed to a mine dam (Dunn Creek Dam) located adjacent to the north-eastern corner of the site. Dunn Creek Dam is an authorised mine affected water release location (Environmental Authority EPML00720413 Callide Coal Mine). Concentrations of PFAS in Dunn Creek (upstream of Callide A) reported concentrations of total PFAS up to 0.244 µg/L. A generalised CSM for Callide A and a detailed CSM for the investigation are included in Appendix G of the EE CLID.	The receptors associated with the migration pathways in Callide A include: • Dermal contact, inhalation or ingestion exposure pathway to site workers operating in areas impacted by PFAS (soil or water) • Flora ecological receptors of current and future revegetated areas (including rehabilitated areas) • Ecological receptors (aquatic and terrestrial) associated with Dunn Creek and Callide Dam	• The risk to site users is considered relatively low based upon both the decommissioned status of Callide A and the operational conditions and controls required for workers interacting with impacted soils and waters • Dunn Creek is ephemeral in nature until the discharge point into where Dunn Creek mixes with waters in Callide Dam. Samples from this location (SW36) have not reported detectable concentrations of PFAS.

Source	Migration Pathways	Receptor(s)	Considerations / Comments
Migration Pathways – Offsite (Surface Water)	Offsite migration of PFAS via surface water flow is considered to occur as follows: • Regional surface water flows (including from Callide Power Station and southern portions of the mine) drain towards Callide Creek. • Surface water within Callide Creek flows from east to west. When the aquifer is comparable to the level of Callide Creek (water level high), water will continue as surface water to downstream catchments (bypass flow). When the aquifer is below the level of Callide Creek, surface water will infiltrate into the aquifer. • Callide Creek is generally considered to be losing (surface water infiltrating to groundwater), however in some sections groundwater may discharge to surface water when the underlying aquifer is full (gaining). The current and historical mass and flux of PFAS in surface water is considered to be highly variable, and influenced by release of PFAS from source areas (historical releases higher than current releases), rainfall within the catchment, water released from Callide Dam and the condition of the underlying aquifer. Appendix G of the EE CLID summarises key PFAS migration pathways for surface water.	The receptors associated with the offsite surface water migration pathways include: • Incidental ingestion and dermal contact exposure pathway for recreational users in surface waters (Lake Callide and Callide Creek) • Human consumption of edible aquatic biota caught from Lake Callide or Callide Creek • Landholders utilising waters from Callide Creek for irrigation of consumable products and subsequent ingestion (i.e. poultry, vegetables, cattle) • Aquatic organisms in direct contact with waters impacted by PFAS • Higher order terrestrial / avian organism consuming aquatic organisms from Callide Creek	• Surface water results were reported below the recreational guideline values indicating risk is likely to be low to recreational water users • Surface water use for irrigation is likely to be limited, with only a minority of landholders identified abstracting water from Callide Creek • Concentrations of PFAS reported in Callide Dam were reported below the laboratory's LOR, however results indicate PFAS is discharged to Callide Dam via the Dunn Creek catchment which could potentially be present in biota. • Offsite concentrations of surface water reported below the 95% species protection limit, and sediment below the ecological direct and indirect exposure criteria, as such direct ecological exposure is likely to be low risk • Based on current advice from the DAF, there is no evidence to suggest PFAS has a detrimental effect on stock health at levels likely to be found in contaminated areas.
Migration Pathways – Offsite (Groundwater)	Within the Callide Creek alluvium, concentrations of PFAS are variable, but present throughout the offsite investigation area. Water movement within the Callide Creek Alluvium occurs at a rate of 4.2 m/day, with water moving from east to west and expanding (north-south) with the aquifer. Since the commissioning of Callide B Power Station, groundwater may have moved up to 17 km down the Callide Valley. Migration of PFAS is considered to mirror water movement, however migration of	The receptors associated with the groundwater offsite migration pathways include: • Incidental ingestion and dermal contact exposure pathway for recreational users in water sourced from groundwater (i.e. swimming pools)	• Groundwater water results were reported below the recreational guideline values indicating risk is likely to be low to recreational water users • Where groundwater has been identified above the drinking water criteria, and is currently being used

Source	Migration Pathways	Receptor(s)	Considerations / Comments
	PFAS will occur at a slower rate. A number of mechanisms are considered to have influenced the current distribution of PFAS within the aquifer. These include: • Current and historical releases of PFAS from Callide Power Station, and other potential PFAS sources. It is noted that the current mass of PFAS entering the alluvium is considered to be lower than historical volumes, and will continue to decrease with time following cessation of AFFF use and remediation of primary source areas. • Recharging of the aquifer by surface water is likely to dilute PFAS within central areas of the alluvium (along the alignment of Callide Creek). The higher concentrations along the northern and southern margins of the aquifer are considered to represent the longer-term background concentrations prior to the commencement of surface water releases from Callide Dam which commenced in 2010. The current mass of PFAS within the Callide Creek Alluvium (between Callide Power Station and Jambin-Dakenba Road) is estimated to be 6.8 kg. Appendix G of the EE CLID summarises key PFAS migration pathways for surface water.	• Landholders utilising extracted groundwater for irrigation of consumable products and subsequent ingestion (i.e. poultry, vegetables, cattle) • Human consumption of untreated groundwater for drinking water • Plant uptake from shallow groundwaters within the alluvial aquifer	for drinking water, CS Energy are providing alternate water supply solutions including supply of bottled water, town water and/or installation/upgrade of rainwater collection tanks. • Based on current advice from the Department of Agriculture and Fisheries (DAF), there is no evidence to suggest PFAS has a detrimental effect on plant health at concentrations found in groundwater offsite. • Based on current advice from the DAF, there is no evidence to suggest PFAS has a detrimental effect on stock health at levels likely to be found in contaminated areas.

4 SUMMARY OF IDENTIFIED DATA GAPS

Based upon the results of the CLID, seven data gaps were identified at the conclusion of the investigation. These data gaps are summarised in **Table 7**. Current investigations are underway to address the data gaps 4 to 7, with the proposed scope of works to address gaps 1 to 3 and supplement the investigations for data gaps 4 to 7 are detailed in this addendum SAQP.

Table 7. Identified Data Gap and Proposed Actions

Data Gap	Details	Addressed by Existing/ Ongoing Scope of Work?	Additional Works Proposed to Address Data Gaps	Additional works detailed in this SAQP?	Other works currently being undertaken outside of this SAQP
1.	Results from soil and sediment investigations at AD4 indicate that a localised source of PFAS may be present within AD4. Further investigation will be required to determine the nature and extent of potential impacts at AD4.	**No**	Proposed works detailed in **Section 6.2**, including: • Site history review to confirm the nature of wastes disposed in AD4 and disposal locations where applicable (refer historical image review in **Section 4.1.1**) • Further investigation at AD4 to confirm the nature and extent of PFAS impacts identified in soil and sediment	✓	• NA
2.	Soil investigations completed at Callide A indicate a localised PFAS impact may be present within the catchment of the NSP, with elevated concentrations of PFAS reported in soils (coal ash/dust) within the northern sediment pond along with surface water. Further investigation will be required to determine the nature and extent of potential impacts at the Callide A NSP	**No**	In addition to the current works being undertaken including ongoing surface water sampling (discussed in **Section 6.4**), the following works are proposed (discussed in **Section 6.3**) • Further soil investigation around catchment of NSP, targeting coal stockpile area, delineation of impacts within NSP • Possible installation of groundwater well adjacent to NSP and within any potential migration pathways between NSP and R2 (i.e. within Ash Dam) • Continued sampling from discharges to R2 (seepage and surface water pathways)	✓	• NA
3.	PFAS is reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations, noting limited water is release via R2 and PFAS impacts were also reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine). No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A, with PFAS reported at R2 likely associated with soil impacts identified at the NSP. Further investigation will be required to confirm the source of PFAS reported within R2.	**Partially**		✓	• Ongoing event based (post rainfall) surface water sampling is being completed across the site, including R2 and locations within Dunn Creek. • The R2 discharge location is currently undergoing an engineering design review to aid in the management of surface water releases from this location.

Data Gap	Details	Addressed by Existing/ Ongoing Scope of Work?	Additional Works Proposed to Address Data Gaps	Additional works detailed in this SAQP?	Other works currently being undertaken outside of this SAQP
4.	Groundwater results indicate that the eastern seepage area likely comprises at least two seepage pathways, one associated with the current seepage pathway and seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32. Further investigation will be required to confirm the nature and extent of seepage pathways at the eastern seepage area.	**Partially**	A geophysical resistivity survey has been completed, with the report recommending intrusive works to assess potential seepage areas. CS Energy have proposed a drilling program to assess seepage pathways (to be delivered independently of this SAQP), with sampling of newly installed investigation and/or recovery wells to be completed. Following completion, new monitoring locations will be included in the ongoing groundwater and surface water monitoring program (discussed in **Section 6.4**). Ongoing monitoring of surface water along the northern site boundary will continue (discussed in **Section 6.4**), with CS Energy investigating potential engineering solutions to enable monitoring of water flows entering the site. Temporary monitoring of surface water flows is proposed as detailed in **Section 6.5**.	✓	• Geophysical resistivity surveys have been undertaken which will inform an intrusive drilling investigation program to refine the understanding of the seepage regime onsite. Following the conclusion of the drilling program the placement of seepage recovery infrastructure will be reviewed and installed groundwater bores sampled as part of ongoing monitoring of PFAS onsite
5.	Groundwater results from the western seepage area indicate some wells, including MW49, may be outside the current groundwater seepage recovery area. In addition, surface water within the western stormwater diversion channel (carrying stormwater from the north) may infiltrate through alluvial soils in the south-western portion of the site, potentially contributing to PFAS impacts in groundwater. Further investigation will be required to confirm the nature and extent of seepage pathways at the western seepage area along with potential contribution from surface water infiltration.	**Partially**		✓	
6.	High concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and western stormwater diversion channels. Further investigation will be required to assess the nature (including mass) of PFAS entering the site via these pathways. It is noted that management of PFAS impacts from these pathways will need to be undertaken in conjunction with remediation and/or management of offsite source areas.	**Partially**		✓	• CS Energy has installed temporary sensors to enable the monitoring of water entering the site along the northern site boundary (**Section 6.5.3**), with engineered solutions currently being investigated • Batchfire (Callide Mine) is currently completing an investigation as part of an Environmental Evaluation Notice. CS Energy will continue to keep

Data Gap	Details	Addressed by Existing/ Ongoing Scope of Work?	Additional Works Proposed to Address Data Gaps	Additional works detailed in this SAQP?	Other works currently being undertaken outside of this SAQP
					Batchfire informed through the completion of both EE programs.
7.	Potential risks to human and ecological health have been identified (refer EE CLID Sections 12.2 and 12.3 respectively). Further assessment of risk will be required to be completed to quantify potential risks to human and ecological receptors. It is noted that biota sampling was presented as Appendix E to the EE CLID.	**Yes**	Completion of proposed biota sampling as detailed in the SAQP (Epic 2022b) is scheduled to be undertaken during the next wet season period (end January 2023).	**X**	• Sampling of offsite landholders is continuing to inform the management of risk to water users. A third round of landowner sampling is currently underway and due to be completed by mid-2023. • Following completion of biota sampling, CS Energy propose to undertake a Human Health and Ecological Risk Assessment (HHERA) to assess potential risks to human health and ecological receptors.

Notes:

- NA – Not applicable

4.1 Data Gap 1 Summary: AD4

AD4 was commissioned in 1979 to service Callide A Power Station, transitioning to service Callide B in approximately 1988. AD4 remains part of the ash/water management of Callide B Power Station. AD4 is located within the WCF (**Figure F1**) and is reported to have had a capacity of approximately 1,200 ML, with the crest of the dam wall located at 239.5 m AHD and a total depth of approximately 10 m. The spillway for AD4 is located at 238.5 m, with surface water and potential seepage discharging to the northern end of the Drains Reclaim Dam (DRD). Notably, the Environmental Authority (EA, EPPR 000536313) for the site authorises the release of ash and effluent to the Waste Containment Facility, where AD4 is located, from the following sources:

- The sedimentation dams
- Effluent from the chemical drains
- Demineralisation and treatment plant
- Callide C blowdown water
- Cooling tower blowdown
- Effluent from chemical cleans
- Washdown waters
- Quantities of oils and petroleum products that will not cause environmental harm
- Dirty drains
- Boiler blowdown
- Blowdown water treatment plant
- Ash dam B seepage pond waters
- Coal plant wastes
- Cooling tower sludges
- Waste ion exchange resins
- Bag filters (and including the bag filters)
- Laboratory drains
- Callide A and B station sewage effluent

The disposal of this material within AD4 could represent a potential source. This intrusive investigation of AD4 was completed through three boreholes (AD401-03) as part of the EE scope of works (Epic, 2022c), with its location shown in **Figure F2**. These bores were placed to target the northern, central and southern ash disposal areas. A summary of the investigation is as follows:

- From the samples collected, one (AD401-0.5) reported concentrations of PFOS (0.0143 mg/kg) above the ecological indirect criteria of 0.01 mg/kg, with Sum of PFOS and PFHxS (0.0155 mg/kg) exceeding the HIL-A criteria of 0.01 mg/kg. Sample AD401-0.5 also reported detection of PFHxA (0.0004 mg/kg).
    - It is understood that areas of AD4, adjacent to bore AD401, are used to dispose road sweeping and vacuum excavation spoil generated from across current operational areas of the site.
    - It was concluded that PFAS concentrations likely to be associated with disposal of other materials/wastes in accordance with EA, rather than impacts within the ash material.
- Results from the sediment collected in drainage channels adjacent to coal stockpile / Coal Plant (upstream) and AD4 (downstream) reported an increase in PFAS concentrations and change in PFAS composition between both locations (**Figure 2**).
    - All results were reported below the adopted assessment criteria of 0.01 mg/kg (Sum of PFOS and PFHxS), however results indicated that a localised source of PFAS may be present within AD4.
    - It was noted that soil investigations reported elevated concentrations of PFAS in the north-eastern corner of AD4, which may be associated with these PFAS detected in sediments. It is also noted that overland flow from the waste oil store and western areas of the Coal Plant can drain towards these drains surrounding AD4.

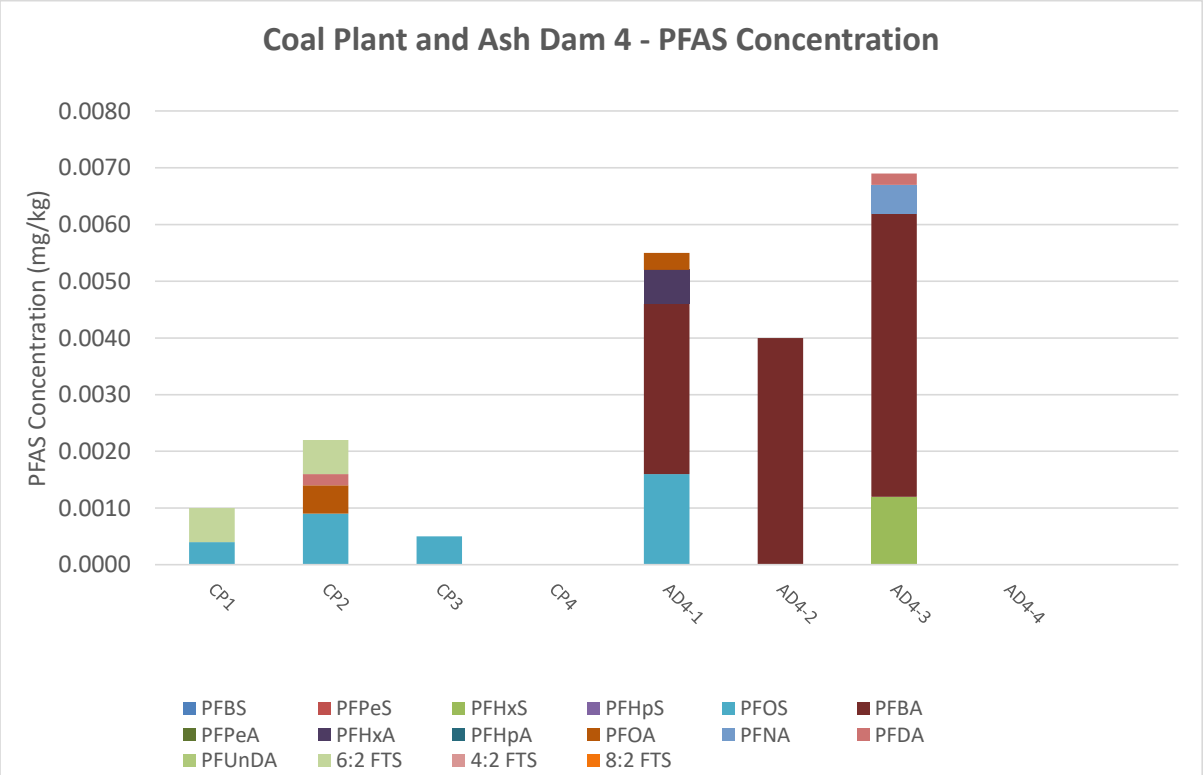

Figure 2. Coal Plant and AD4 – PFAS concentration in sediment (Epic, 2022c)

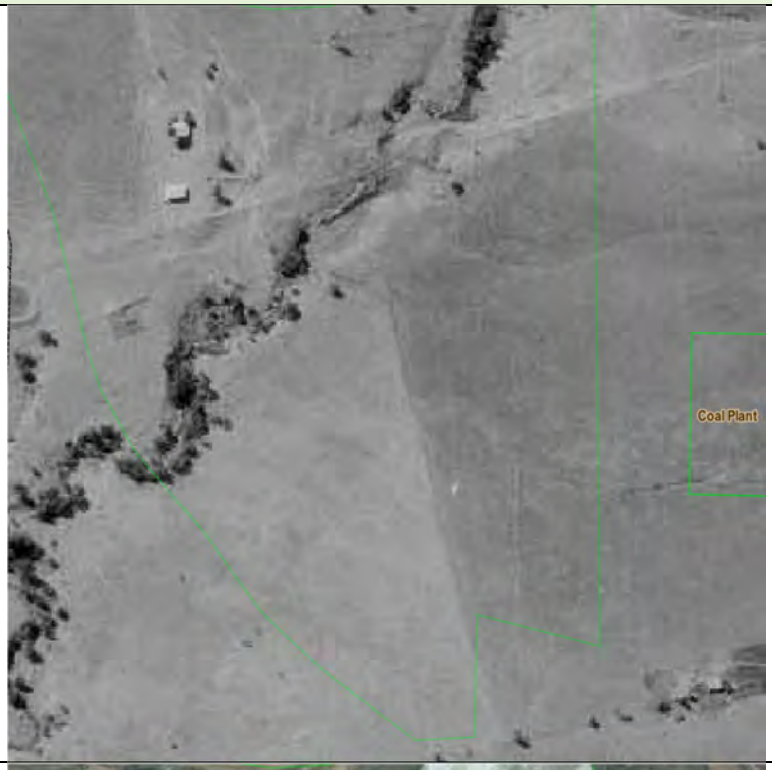
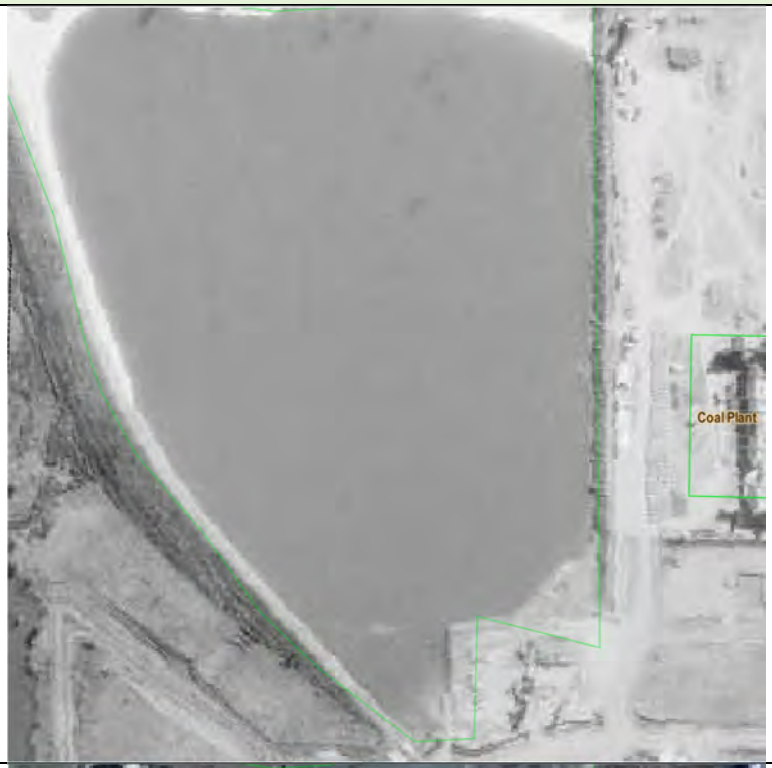
It was recommended that additional investigation be completed to identify and delineate potential sources of PFAS within AD4. To assist with the identification of areas of interest for additional sampling, a supplementary historical aerial image review was completed of AD4 in **Section 4.1.1**.



4.1.1 Supplementary Historical Aerial Review: AD4



As the filling history of AD4 is unclear, a supplementary historical aerial image review was completed to identify the nature of filling and identify any areas of interest. A summary of this review is presented in **Table 8** with the full historical aerials presented in **Appendix C**.

Based upon this review, the following areas of interest were identified for further investigation:

- AD4 was built over the former alignment of Suicide Gully (imagery from 1977 – 1981)
- Potentially bunded pads (imagery from 1999) filled with a potential slurry of unknown nature
- Nature of material used for the construction of the internal dam wall (imagery from 2004)
- Machinery storage immediately north of the belt conveyor tower (imagery from 2012)
- Potential use of AD4 as a temporary coal stockpile (imagery from 2017) with the potential for spontaneous combustion requiring extinguishment
- Windrowed material stockpiles of a distinct red/orange colour (imagery from 2021)

Table 8. Historical Aerial Review: AD4

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1977		Callide B Power Station has not been constructed. The area prior to the construction of the station is primarily used for grazing with small structures (potential house and shed) located north of the watercourse. The watercourse of Suicide Gully is visible bisecting the area of AD4.
1981		The dam walls associated with AD4 are being constructed with significant amount of earthworks visible to the south and east of the dam. Potential cenospheres are visible floating on the surface along the margins of the dam, potentially from Callide A. The watercourse of Suicide Gully has been filled in and is no longer visible.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1984		Construction of the adjacent areas is continuing and has extended further north. Construction of the coal plant has commenced. A larger volume of water is present within the dam identifiable by the inundation of the northern section of the dam, previously visible.
1988		Construction of the adjacent areas are complete with the belt conveyor and coal plant visible. Potential bottom ash (dark grey) is visible filling the northeastern and eastern margins of the dam, with the lighter cenospheres visible across the surface of the water.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1994		Progressive filling of the dam has continued with the volume of water reduced. A darker coloured material (potentially carbonaceous) is filling the dam in the northern and southern areas.
1999		Filling has continued of the dam, with water confined to the western margin of the dam. Two bunded areas (red) are visible in the eastern area of the dam with an unknown material used to fill the area. Vegetation regrowth across the surface of the filled dam is visible in the north and southern areas.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2004		Construction of an internal dam wall is visible with earthworks highlighted in red. A belt conveyor extension has been built in the southern corner of the dam, likely associated with the operations at Callide C. The surface area of water has continued to reduce, and a brown discharge is visible from a potential outlet in the southwest corner of the dam.
2012		Filling of the internally constructed dam has continued, likely with ash (grey) and carbonaceous material (black). Vegetation regrowth has continued the top of the ash dam. Machinery and mechanical parts are visible north of the belt conveyor tower (Red). A water course has been excavated in the northern area of the dam.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2017		Stockpiling of coal is visible in the area of AD4 with black coal visible covering over half the area.
2021		Water course in the northern end of the dam has been filled and has been channelised linking to the remaining water body in the west of the dam. Windrowed stockpiles of soil is visible in the north (red), unlikely to be ash based upon colour.

4.2 Data Gap 2 and 3 Summary: Callide A

Callide A Power Station is located in the north-eastern portion of the site and is located on a small ridgeline that borders Dunn Creek. Ash disposal areas (Ash Dams 1 and 2) are located to the south-west and north-east respectively of the main structure.

Soil sampling completed at Callide A as part of the initial EE investigation (Epic, 2022c) indicate a localised PFAS impact may be present within the catchment of the NSP, with elevated concentrations of PFAS reported in soils (coal ash/dust) within the northern sediment pond along with surface water. These results included:

- No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A with the exception of CA04, CA10 and CA15 (**Figure F3**)
- PFAS concentrations were above the laboratory's LOR at three locations, CA04 (former pump house), CA10 (laydown area) and CA15 (NSP). A summary of the results includes:
  - Results from CA04 (pump house) reported concentrations of PFOS at the LOR of 0.0002 mg/kg at the surface, with all other compounds reported below the laboratory's LOR, and no PFAS detected in deeper samples. Surrounding samples (CA02, CA05 and CA06) also reported concentrations of PFAS below the laboratory's LOR indicating PFAS detected at CA04 is unlikely to represent a significant source of PFAS.
  - Results from CA10 (Oxyfuel laydown area) reported detections of PFHxA, PFHpA and PFOA, with a total PFAS concentration of 0.0007 mg/kg. Activities completed at the laydown area are unknown, with results indicating minor PFAS impacts may be present. It is noted that surface water sampling completed at the eastern stormwater pond (**Figure 3** and **Figure 4**) (downstream of CA10) reports concentrations of PCAs including PFHxA, PFHpA and PFOA above the laboratory's LOR, along with PFOS and PFHxS.
  - Borehole CA15 was drilled within the NSP, with site observations reporting layers of coal ash/dust approximately 1.0 m deep and assumed to comprise runoff from the adjacent coal stockpile and coal hopper. The 0.5 m sample reported concentrations of PFOS (0.0552 mg/kg) above the ecological indirect criteria and Sum of PFOS and PFHxS (0.0624 mg/kg) above the HIL-A criteria. Site history information (Epic, 2022c) indicates AFFF usage at Callide A was likely to be limited to use of portable foam-type extinguishers (blue band), with results indicating localised PFAS impacts may be present within the catchment of the NSP.
- Surface water concentrations of PFAS were reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations. A summary of the results included:
  - Concentrations of PFAS have been reported in all sample locations within Dunn Creek (SW18, SW17 and SW43), with highest concentrations reported in the upstream sample (SW18) (refer **Figure 4**). Most samples collected within Dunn Creek reported concentrations of PFOS above the 95% species protection limit and concentrations of Sum of PFOS and PFHxS above the drinking water criteria. Concentrations are generally reported to decrease along the alignment of Dunn Creek, with concentrations of total PFAS in upstream surface water (SW18) reported between 0.225 – 0.244 µg/L and downstream surface water (SW42) reporting concentrations between <0.0031 – 0.1250 µg/L.
  - PFAS concentrations within Callide Dam at the mouth of Dunn Creek (SW36) have been reported below the laboratory's LOR during each of the five monitoring events completed. However, it is also noted that LORs have been raised in all samples (PFOS LOR of <0.0008 - <0.00016 µg/L).
  - PFAS has been reported within the Northern (SW44) and Eastern (SW43) Stormwater Ponds, along with the Callide A release point (R2) into Dunn Creek. Concentrations of PFAS at R2 were reported to be variable, however concentrations were lower than those observed downstream in Dunn Creek SW17 when sampling was completed at both locations (Dec21 and Jan22, refer **Figure 4**).
- No clear trend is observed with PFAS compositions (**Figure 3**), however some similarities are observed across events (i.e. SW18, SW17, SW42 and R2 during the December 2021 monitoring event). It is noted that SW44 and R2 were the only locations to report detection of 6:2 FTS (both at 0.002 µg/L, Oct21) which may indicate some linkage between these locations.
  - Surface water has also been noted to accumulate within the voids associated with the coal reclaim hopper (**Figure F3**) which may represent a subsurface migration pathway for impacted waters (if any)

- Groundwater bores installed surrounding Callide A have not reported a sufficient standing water level to facilitate sampling. As such, no data is available regarding the PFAS concentrations in groundwater (if any).

It was recommended that additional investigation be done to determine the nature and extent of potential impacts at the Callide A NSP.

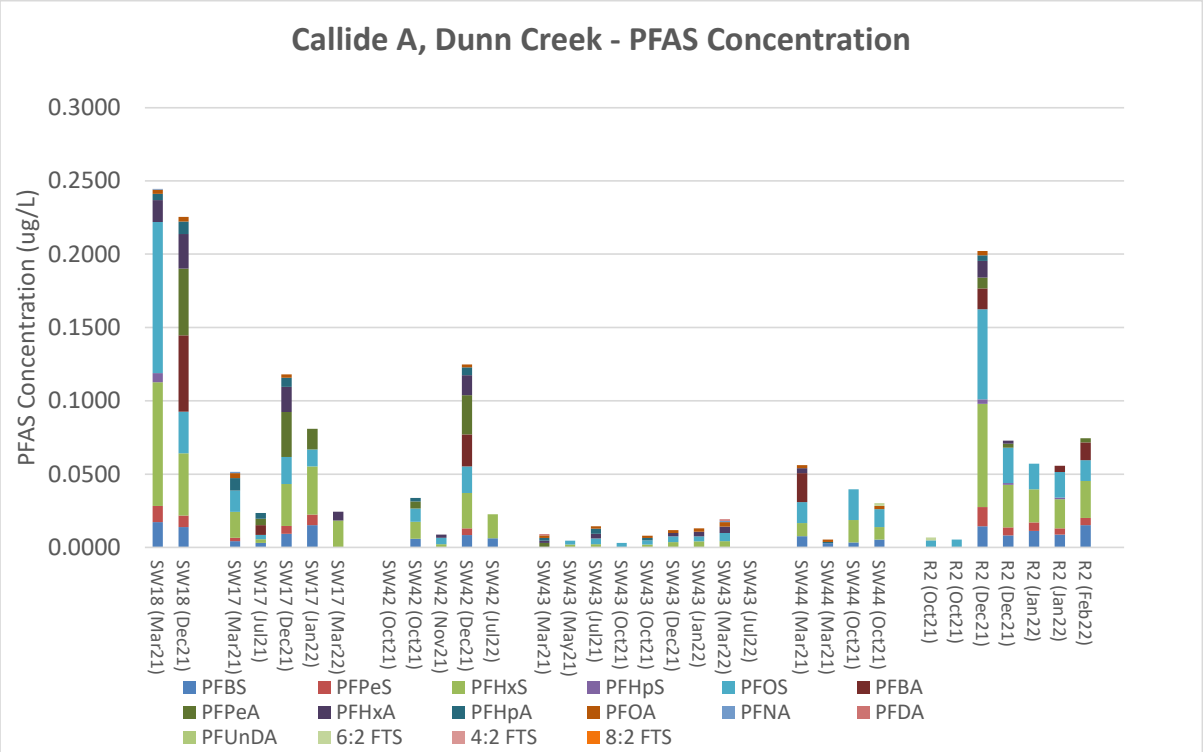

Figure 4. Callide A and Dunn Creek – PFAS Concentration

4.2.1 GHD (2022): Callide A and R2

A site inspection was completed by GHD (2022) of the decant collection system as Ash Dam 2 which discharges to R2. A summary of the findings is presented in **Table 9.**

Table 9. Document Review: Callide A – Ash Dam 2 Investigation and Engineering Plan

Document Title	Technical Memorandum – Callide A – Ash Dam 2 Investigation and Engineering Plan – Preliminary Dam Safety and Environmental Review
Prepared By	GHD
Prepared For	CS Energy
Investigation Site/Area	Ash Dam 2
Date	6 September 2022
Objectives	
The objective of the investigation was to outline the preliminary risks that have were identified from the inspections, desktop reviews and CCTV inspection of the decant system at Ash Dam 2.	
Relevant Findings	
• Significant tree growth and shrubbed vegetation was observed along the upstream and downstream faces of the embankment. • Water overflows from the ESP and NSP via spillways on top of Ash Dam 2. The water is then contained within Ash Dam 2 and should only discharge through R2 if the water level in the Wetland rises to a level where it overtops the decant inlet tower level. When this occurs, the water then passes through the decant system and discharges at R2 (design shown in **Figure 5**). • There was no evidence of seepage from the toe of the dam wall at the time of the inspection • Existing monitoring well (MW21) downgradient of Ash Dam 2, appears to be installed in perched groundwater, that sits above the bedrock and not in the regional groundwater aquifer • The hardstand on which the power station and historically the coal stockpiles were located has been built up and levelled with large boulders in the area between the northern pond and the Wetland. It is possible that these boulders could act as a preferential pathway for surface water in the northern pond to flow directly into	

the Wetland. This is supported by the presence of melaleucas in the Wetland directly down gradient of the northern pond and not in any other areas of the Ash Dam 2.

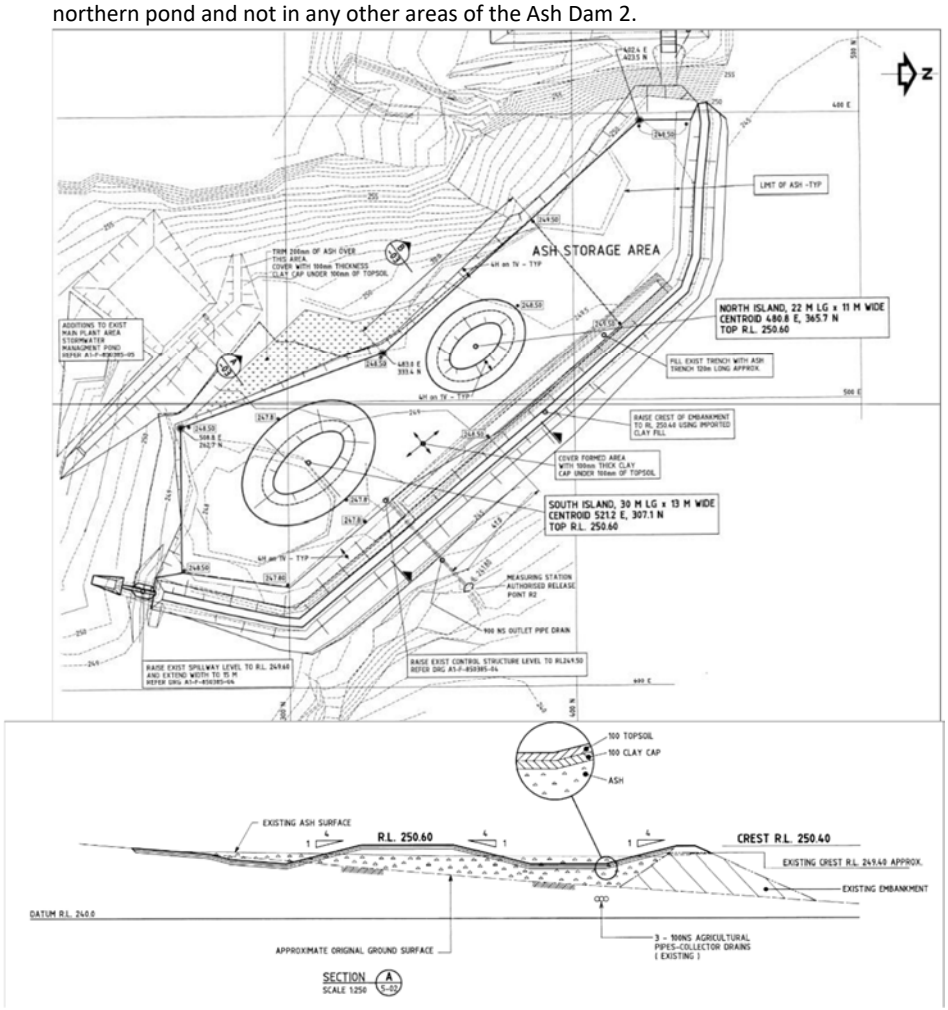

Figure 5. Ash Dam 2 Embankment Rise and Wetland Typical Design (GHD, 2022)

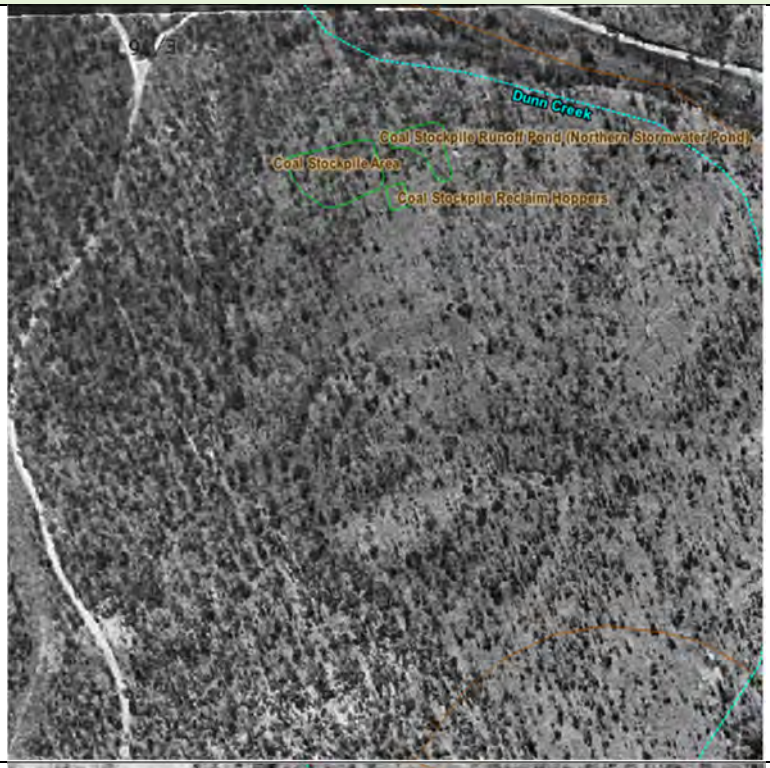

Conclusions and Recommendations

- The desktop review identified that the water quality monitoring in the vicinity of AD2 is generally limited to one surface water sample point (R2) and one groundwater monitoring location (MW21), with the remaining available wells/bores being reported as dry or installed in shallow fill and not representative of the groundwater aquifer.
- The presence and growth of deep tree root systems could damage the pipework or embankments
- A water quality monitoring program is required to understand the conditions surrounding AD2, which is currently proposed to be addressed as part of the works proposed in this SAQP

4.2.2 Supplementary Historical Aerial Review: Callide A

A review of historical aerials was completed of the catchment associated with the NSP. A summary of this review is presented in **Table 10**. The NSP was not visible in photographs prior to 1999, where the area was used for the stockpiling of coal. From this review, areas of interest were identified in (2012) the north-western corner of the site and stormwater channel linking the areas surrounding the ash hoppers with the NSP where white material is visible being washed into the NSP, potentially mobilising impacted material from a historic discharge of a firefighting foam extinguisher into the pond. Additionally, areas of permanent moisture are identifiable in the northern area of Ash Dam 2 (deep rooted vegetation), which may be the result of infiltration from the NSP or spillway discharge from the NSP. These waters would then eventually discharge into R2 through seepage recovery in the ash dam walls, further corroborated with the findings of GHD (2022).

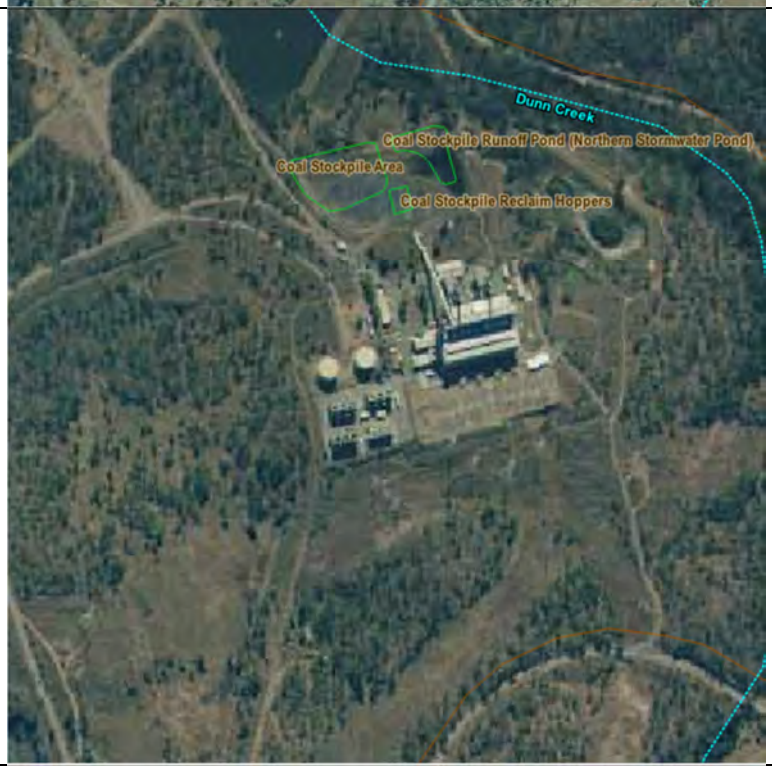

Table 10. Historical Aerial Review

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1958		First available historical image of the site. Area is sparsely vegetated with dirt roads to the north of Dunn Creek and east of the future site.
1965		Callide A Power Station is being constructed with coal loading hopper and NSP visible. Clearing in areas northwest (for the site infrastructure and haul road) and southwest (for the ash dams) is evident from the clearing of trees. Infrastructure in the south of the site (switchyards, water tanks and cooling towers) are still in the process of being constructed.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1973		Shadows from the site smokestacks obscure the areas of interest. Infrastructure in the south of the site has been completed with filling of the ash dam in the southwest with the ash dam wall constructed along the eastern margin of the dam. The walls associated with ash dam 2 have been constructed.
1977		Stockpiles of coal are covering the majority of the coal stockpile area, future NSP and hopper. Pooled water is visible in the ash dam to the east (Ash Dam 2). A haul road is visible entering the area from the northwest of the site with possible dump trucks adding material to the stockpile.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1981		Areas of interest are obscured by smokestack emissions, but the area appears to still be fully covered by coal stockpiles. Site access roads appear to have been sealed. Regrowth across the southwest ash dam has started to occur.
1984		Potentially filling has commenced of the Ash Dam 2 to the northeast of the site, south of Dunn Creek where an outline of possible earthen walls is visible and ponded water in the south-eastern corner of the site. The areas of interest are still covered in coal stockpiles. Equipment and possible trucks are parked in cleared areas to the east of the site (highlighted in red).

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1988		No major changes are visible compared to previous image.
1994		One cooling tower has been removed since the previous image and a reduced number of vehicles and machinery visible in the site. Coal has been removed from the stockpile area. Dunn Creek appears to have been dammed north of the site.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1999		Stockpile area has been reduced in size and the NSP has been constructed. The ash dam located to the east of the site (Ash Dam 2) has been filled and vegetated. The area is holding water, with the topographic highs visible as islands of the constructed wetlands. A replacement cooling tower appears to have been constructed.
2004		Water in the Ash Dam 2 has been removed / evaporated or the dam filled, with no water visible. Regrowth is visible in the northern end of this ash dam. Additional coal has been removed from the stockpile area.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2012		Regrowth has occurred in the northern end of the ash dam located in the east of the site not visible in the original rehabilitation visible in 1999. The infrastructure associated with the oxyfuel combustion trials are visible adjacent to the site in the east along with the associated equipment laydown. White material (red) can be seen washing out of the power station facility into the NSP through the drainage channel. Soot or coal dust is visible on the eastern side of the roof of Callide A generator house (enlarged below highlighted in orange) not visible in previous images.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2021		Coal has been removed from the stockpile area and removal of cooling towers and infrastructure associated with the oxyfuel trial has been completed. Powerlink switchyard has been removed and the area rehabilitated. Regrowth across the eastern ash dam has continued primarily in the northern end of the dam.

Note:

Areas highlighted are approximate with historical aerial images manually georeferenced against identifiable site features.

4.3 Data Gap 4 to 6 Summary: Groundwater and Surface Water PFAS

Additional data gaps were identified in respect to the groundwater and surface water distribution of PFAS (summarised in **Table 7**). Ongoing monitoring for PFAS has been completed since 2021, with a summary of the results as follows:

- A number of onsite and offsite groundwater results have reported concentrations (or raised LORs) above the 99% species protection limit, generally due to the presence of suspended solids. A summary of the groundwater results included:
  - Based upon TOPA results, it was considered that groundwater in proximity to the site (extending up to approximately 2 km downgradient) may contain an additional mass of PFAS precursors, with groundwater further downstream unlikely to contain an additional mass of PFAS precursors.
  - Groundwater results for background monitoring wells located along the northern (hydraulically upgradient) boundary indicated that groundwater located along the northern site boundary (as represented by MW01 and MW74) is likely to have been impacted from surface water entering the northern site boundary from the area of the mine (operated by Batchfire), which has reported elevated concentrations of PFAS (including SW34 and SW33).
  - Groundwater results for the eastern seepage area reported significant differences in both concentration and composition between onsite wells (MW11, ESC1, ESC3, ESC4, total PFAS up to 0.859 µg/L) and offsite wells (MW31, MW32, MW33 and MW43, total PFAS up to 9.850 ug/L).
    - It was considered likely that the eastern seepage area comprises at least two seepage pathways, one associated with the current seepage pathway/seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32.

  - Groundwater results from the western seepage area reported PFAS composition to be relatively comparable across all monitoring wells, with MW49 reporting a greater proportion of PFHxS and highest concentrations (total PFAS up to 4.67 µg/L, approximately one order of magnitude higher than other wells [total PFAS between 0.22 – 1.01 ug/L]).
    - It was considered likely that surface water within the Western Stormwater Diversion Channel infiltrates through shallow alluvial soils in the southern portion of the site, however current results indicate this is unlikely to be cause of elevated concentrations within MW49, which may have elevated levels due to being located outside of the current groundwater seepage capture area.
- Concentrations of PFAS within the Callide Creek alluvium were reported to be variable (total PFAS between 0.003 – 0.386 µg/L), but present throughout the offsite investigation area, with PSAs (including PFOS and PFHxS) comprising the dominant PFAS group. Detections of PCA and FSA compounds were generally limited to areas upstream of the Dawson Highway (closer to the site). In general, PFAS concentrations decrease with distance from the site, with the composition of PFAS also observed to change with distance from site (higher proportion of PFOS adjacent to the site, with PFHxS becoming the main compound approximately 5 km downstream). As such:
  - The results support the current CSM that the variability of PFAS concentrations were associated with a number of mechanisms including the variability of current and historical releases, variability of aquifer composition and recharging of the aquifer by surface water and releases from Callide Dam which is likely to dilute PFAS within central areas of the alluvium (along the alignment of Callide Creek).

Based upon these results, it was recommended that monitoring of groundwater and surface water should continue at select groundwater and surface water locations across the site and within the study area to provide ongoing assessment of PFAS within key migration pathways (including Callide A/Dunn Creek, the northern and western stormwater diversion channels and the western and eastern seepage areas) and the receiving environment to monitor potential impacts to human health and ecological receptors. Additionally, it was recommended that monitoring should also include monitoring locations which inform the effectiveness of and/or impacts associated with implementation of remediation and management works undertaken at the site.

Additional works are currently underway to provide further characterisation of seepage pathways onsite with the geophysics investigation and associated drilling program being delivered separately to address data gaps 4 and 6, with the proposed works (**Section 6.4**) designed to supplement these ongoing works.

5 DATA QUALITY OBJECTIVES

5.1 Establishing DQOs

The DQO process consists of seven iterative steps, which are designed to clarify the specific project objectives, define the appropriate type of data and inputs required and specify tolerable levels of potential decision errors. Depending on the intended use of the data, there are two types of DQOs:

- Decision making problems – which are addressed by performing statistical hypothesis tests on the collected data
- Estimation problems – which involve using the collected data to estimate some unknown population parameter together with some reported measure of uncertainty in the estimate

These DQOs are estimation DQOs, and the seven steps and associated planning process output is detailed in **Table 11**. These seven steps are:

- Step 1 of the DQO process aims to define the problem that has initiated the study by stating the problem
- Step 2 of the DQO process aims to define the problem that has initiated the study by identifying the goal of the study. Details associated with Step 2 are presented below.
- Step 3 of the DQO process aims to identify the information that will be required to support the decision and specify which inputs require new environmental measurements.
- Step 4 of the DQO process aims to define the spatial and temporal boundaries that the data must represent to support the decisions. Details associated with Step 4 are presented in the table below**.**
- Step 5 of the DQO process aims to define the statistical approach by developing a logical "if …, then …, else …" statement that defines the conditions that would cause the decision maker to choose among alternative actions.
- Step 6 of the DQO process aims to specify probability limits for false rejection and false acceptance decision errors.
- Step 7 of the DQO process aims to identify a resource effective sampling and analysis design for generating data that are expected to satisfy the DQOs.

Table 11. Summary of DQO aspects of proposed investigation

Aspect	Detail
STEP 1 *Describe the problem, develop a conceptual model of the environmental hazard to be investigated, and identify the general type of data needed.*	• PFAS was detected within groundwater and surface water at the site boundary and in downstream monitoring locations up to approximately 10 km downstream of the site, with some locations reported to exceed the Australian Drinking Water Guideline for PFOS + PFHxS. • DES issued an EE notice requiring CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site. • As part of the EE site investigation works completed to date, PFAS has been identified in AD4 and in the Callide A NSP. The source, extent and nature of these detections were not able to be determined, requiring additional data to be collected. • PFAS in groundwater and surface water bodies were identified across the investigation area, requiring additional investigation be completed to facilitate an update to the PFAS flux model across the site.
Establish the planning team and identify the team's decision makers.	• Works are to be undertaken by a Suitably Qualified Person (SQP) in accordance with the requirements of the EE Notice. Details on the project team are outlined in **Section 1.3**.
Develop/refine the conceptual site model (CSM).	• A summary of the site wide CSM is presented in **Table 6.** Development of the CSM is detailed further the CLID (Epic, 2022c)
Define the exposure scenarios.	• PFAS is extremely soluble and highly mobile in water, consequently surface water and groundwater flow are important transport mechanisms for PFAS compounds. Potential water flow and contaminant transport from the site to the surrounding environment was likely dominated by surface water and groundwater flows.

Aspect	Detail
	• The primary exposure pathways associated with human health was ingestion, associated with primary surface water and groundwater pathways (including drinking water) and secondary pathways through the consumption of impacted produce and biota. Ingestion of impacted media and to a lesser extent dermal contact and inhalation pathways were considered to be limited.
Discuss alternative approaches to investigation and solving the problem.	• A notice to conduct or commission an environmental investigation was issued in accordance with Section 326B of the *Environmental Protection Act 1994*. All works detailed in the EE and the subsequent amended notice are required to be completed.
Identify available resources, constraints, and deadlines associated with planning, data collection, and data assessment.	• A CLID (site investigation report) was prepared to address the requirements of the initial EE and delivered to DES on 7 September 2022 • Based upon the identification of data gaps (**Table 7**) an extension was issued by DES with the final EE CLID required for delivery to DES by 1700 on 13 October 2023 • It is noted that multiple investigations have been completed or are currently ongoing to address the full requirements of the EE (detailed in **Table 7**). Further to this, several aspects relevant to the EE are to be completed outside of investigations detailed in this SAQP (refer **Table 7**).

STEP 2:
 	
Identify the principal study question(s).
	• The principal study questions for this sampling plan are:
	  • What is the source of PFAS detected in AD4 (Data Gap 1) and at Callide A within the NSP Catchment (Data Gaps 2 and 3)
	  • What is the nature and extent of PFAS contamination at the site, including areas identified to comprise an existing data gap
	  • What are the likely pathways associated with PFAS contamination at the site to other areas of the site, surface waters, drainage lines, stormwater infrastructure and groundwater (Data Gaps 4, 5 and 6)?
	  • For pathways identified, what is the nature of the connectivity/completeness of these pathways and relative contribution to site mass flux of PFAS?
	  • What are the potential risks to human and ecological health including aquatic biota

Define alternative actions that may be taken based upon the range of possible outcomes that result from answering the principal study question.	• Where data gaps are unable to be resolved, further investigation to be completed to inform and close out relevant gaps • Where PFAS contamination has been identified at the site, options for remediation / management can be established. • Where environmental harm is not identified ongoing monitoring of relevant media can continue in accordance with site licencing requirements and include identification and reporting (if required) of any trends or changes in site conditions.
Combine the principal study question and the alternative actions into a decision statement.	• If investigations are unable to close identified data gaps, further investigation will be completed to be completed to inform and close out relevant gaps. • If investigations indicate that direct or indirect releases of AFFF resulted in measurable impact to soil, sediment, surface water, groundwater and/or biota, actions required to prevent or minimise any further releases of contaminants and options for remediation of impacts will be required to be established. • If investigations indicate that direct or indirect releases of AFFF have not resulted in measurable impacts to soil, sediment, surface water, groundwater and/or biota, the previously developed CSM (Epic, 2022c)will be reviewed and updated, with further recommendations made where applicable in the main report.
Organize multiple decisions into an order of sequence or priority.	N/A
STEP 3: *Identify the information that will be required to resolve the decision statement and determine the sources for each item of information identified.*	The following existing information was utilised in resolving the decision statement: • Information on current and historical site activities as detailed in **Section 3** and the completed CLID (Epic, 2022c). • Results from previous PFAS investigations completed at the site summarised in the CLID (Epic, 2022c). • Hydrogeological information available for the site and receiving environments detailed in the CLID (Epic, 2022c).

Aspect	Detail
	• Groundwater and surface water levels, chemistry, connectivity, hydraulic conductivity and velocity. • Review of the representativeness of monitoring locations to assess potential sources along with potential impacts to identified receptors. • Review of GHD (2022) investigation into the integrity of Ash Dam 2. New/Additional Information: • Identification of all potentially impacted media (including groundwater, surface water, soil) within the nominated study boundary • Update of potential pathways between potentially impacted media and human and ecological receptors • Confirmation of PFAS contamination through sampling and analytical testing by a NATA accredited laboratory (as applicable) to be completed on all media for PFAS (standard suite of 28) to the lowest laboratory limit or reporting • Leachability assessment of soil and sediment samples (as applicable) • Analysis of samples for additional laboratory analytical methods including physicochemical parameters and cations/anions to enable comparison of and between aquifers and surface water bodies • Potential impacts/contributions from adjacent land uses including groundwater and surface water impacts from the Callide Mine and surface water releases from Callide Dam • Sampling and analysis of aquatic biota within Callide Creek and associated waterways

Identify the information needed to establish the action level.	The adopted action levels were detailed in the original SAQP (Epic, 2022b) and was based on environmental guideline values detailed within the following guidelines:
	• PFAS NEMP, including
	  • Table 1. Human health guideline values
	  • Table 2. Human health investigation levels for soil
	  • Table 3. Ecological guideline values for soil
	  • Table 4. Biota guideline values
	  • Table 5. Ecological water quality guideline values (freshwater)
	• NHMRC Guidance on Per and Polyfluoroalkyl substances (PFAS) in Recreational Water (2019)

Confirm that appropriate analytical methods exist to provide the necessary data.	Proposed analytical testing and detection limits will be consistent with the previous sampling events. Laboratory analysis will be completed by Australian Laboratory Services (ALS) (primary laboratory) and Eurofins MGT (Eurofins) (secondary laboratory). Both laboratories are NATA accredited for the analytical testing proposed. All analytical procedures used by the laboratories were in accordance with established internationally recognised procedures such as those published by the United States Environmental Protection Agency (USEPA), American Public Health Association (APHA) and relevant Australian Standards/New Zealand Standards (AS/NZS).
STEP 4 *Specify the characteristics that define the population of interest.*	Onsite investigations will be limited to within Lots 1 RP615528 and 4 SP103557 which form the current Callide Power Station site. Areas of interest for this supplementary investigation includes: • Callide A • AD4 • Seepage recovery areas adjacent to Ash Dam B Offsite investigation areas include areas immediately surrounding the boundaries of the site and included areas within Dunn Creek and Callide Creek. Investigation areas along the alignment of Callide Creek will continue to include public and private lands extending to Jambin Dakenba Road, approximately 10 km west of the site. Aquatic biota sampling will be completed within Callide Creek (including Callide Dam and upstream areas), with reference sampling to be completed within Kroombit Dam (adjacent catchment).

Aspect	Detail

Define the geographic area and media to which the decision statement applies.	• Assessment of groundwater was limited to existing groundwater monitoring and abstraction wells including:
	  • CS Energy groundwater monitoring wells
	  • Department of Regional Development, Manufacturing and Water (DRDMW, formerly DRNME) monitoring wells
	  • Private groundwater abstraction bores
	• Assessment of surface water will be limited to existing onsite surface water bodies along with areas of Callide Creek and Dunn Creek within the investigation area
	• Assessment of soil (including ash) will be limited to Callide A and AD4 within the boundaries of the site
	• Aquatic biota sampling will be completed within Callide Creek (including Callide Dam and upstream areas), with reference sampling to be completed within Kroombit Dam (adjacent catchment)

When appropriate, divide the populations into strata that have relatively homogenous characteristics.	• Assessment of groundwater will target the uppermost aquifer identified beneath the site. • Assessment of surface water will include onsite water bodies and existing environmental monitoring locations within Callide and Dunn Creeks. These will then be divided based upon onsite catchments. • Assessment of soil will target both fill and natural soil profiles. Investigation will not be completed within underlying rock profiles. • Aquatic biota sampling will be completed in accordance with the existing Sampling Plan, targeting species of different trophic levels to inform risks to human and ecological health.
Determine the time frame to which the decision applies.	The findings of the proposed SAQP addendum works will be required to be submitted 13 October 2023 (EE Requirement 8).
Determine when to collect data.	Implementation this SAQP will be undertaken as a number of separate monitoring/sampling events. It should be noted that some scope of works have already commenced or are a continuation of the previous SAQP program (prior to issue of the SAQP), including aquatic biota sampling.
Define the scale of the decision making.	The results collected during investigation, in addition to previous information determined to be appropriate, will inform the principal study questions nominated above, and determined whether further works/actions are required to be completed.
Identify any practical constraints on data collection.	Data collection will be limited by a number of factors including: • Site operational considerations which could limit access to monitoring locations, including exclusion zones and existing above and below ground infrastructure. • Access to monitoring locations can be limited due to weather or natural events including rainfall/flooding or storms. • Subsurface conditions could limit the vertical extents of the investigation (refusal on rock). • Potential travel restrictions associated with public health orders.
STEP 5 *Specify the statistical parameter that characterises the population of interest, such as mean, median, maximum or proportion, etc.*	Analytical results will be compared against the adopted assessment criteria to provide an indication of whether potential or actual environmental harm could occur. In addition, analytical results will be utilised to enable comparison of and between soil, sediment, groundwater and surface water (where applicable) to assess representativeness and reliability of monitoring locations along with potential linkages between media. To ensure statistically significant data sets account for seasonal/temporal variations, additional assessment works will be completed from existing established monitoring locations. Data collected from established monitoring locations will result in a more statistically robust data set, with new locations sampled to provide preliminary/indicative information to inform potential sources and/or impacts.

Aspect	Detail
Specify the action level for the decision.	Analytical results will be compared against the adopted assessment criteria**.** It should be noted that in accordance with the NEMP, a higher level of protection has been adopted (i.e. 99% species protection for slightly-moderately disturbed systems instead of 95% species protection) due to the bioaccumulative nature of PFAS, in the absence of biota sampling (scheduled to be completed early 2023) and completion of a site specific detailed risk assessment. Field QA/QC will be completed in accordance with the proposed QA/QC plan as outlined in **Section 6.9**.
Confirm that measurement detection will allow reliable comparisons with the action level.	All analysis will be completed to the lowest practicable limit of reporting (LOR). Analysis of groundwater and surface water will be completed using Super-Ultra Trace methods (0.0002-0.0005 µg/L) to achieve LORs below the 99% Species Protection limits. It is noted that some samples reported elevated LORS due to sample turbidity which is expected to continue through future sampling events.
Combine the outputs from the previous DQO steps and develop a decision rule.	If laboratory results report concentrations above the adopted assessment criteria, then, further assessment will be completed to determine the nature and extent of any impact (where it was not already defined). If field and laboratory QA/QC data report results within acceptable ranges, then, analytical data will be considered suitable for interpretative use.
STEP 6 *Specify the decision rule as a statistical hypothesis test.*	The Null hypothesis (H_O) is that that concentrations of PFAS associated with the direct or indirect release of AFFF resulted in concentrations that exceeded the adopted assessment criteria and/or has resulted in environmental harm. The Alternative hypothesis (H_A) will be that concentrations of PFAS are below the adopted assessment criteria and/or have not resulted in environmental harm.
Examine consequences of making incorrect decisions from the test.	False rejection or Type I error of determining the site is not causing environmental harm when it is (wrongly rejects a true H_O). Consequence will be potential risks and ongoing harm to human health and/or the environment. False acceptance or Type II error of determining the site is causing environmental harm when it is not (wrongly accepts a false H_O). Consequence is unnecessary expenditure and implementation of actions to prevent or minimise further harm and/or manage identified risks.
Place acceptable limits on the likelihood of making decision errors.	The acceptable limits on decision errors will be applied for the implementation of these works, and the manner of addressing possible decision errors are to be developed based on the Data Quality Indicators (DQIs) of precision, accuracy, representativeness, comparability and completeness**.** The potential for significant decision errors will be minimised by: • Assessing whether appropriate sampling and analytical density and representativeness are achieved • Completing a robust QA/QC assessment of the field and laboratory data and application of the probability that 95% of data that satisfied the DQIs, therefore a limit on the decision error will be 5% that a conclusive statement may be incorrect • Ensuring the assessment criteria adopted is appropriate • Sufficient mass/volume of sample media is collected to achieve the lowest possible LORs • Laboratories holding NATA accreditation are used for the analytical methods adopted • The potential for significant decision errors are to be minimised by completing a robust QA/QC program and an environmental assessment that has an appropriate sampling and analytical density for the purposes of the assessment in which representative sampling was undertaken and appropriate sampling methodologies which are to be employed by trained and experienced field personnel

Aspect	Detail
STEP 7 *Document the final sampling and analysis design, along with a discussion of the key assumptions underlying this design.*	Details of the identified data gaps are detailed in **Section 4**, with details and justification of proposed sampling detailed in **Section 6**.
Detail how the design should be implemented, together with contingency plans for unexpected events.	Details of the of the proposed sampling and analysis design are detailed in **Section 6**.
Determine the quality assurance and quality control (QA/QC) procedures that would be performed to detect and correct problems to ensure defensible results.	QA/QC procedures which are to be adopted for field and laboratory aspects are outlined in **Section 6.9**.
Document the operational details and theoretical assumptions of the selected design in the sampling, analysis and quality plan (SAQP).	Operational details and design elements are detailed in **Section 6**. These are taken from the SAQP prepared for the initial phases of the project (Epic, 2022b)

6 PROPOSED ADDITIONAL INVESTIGATION

6.1 Objective

The objective of these proposed works is to address the identified data gaps discussed in **Section 4.** It should be noted that additional works are currently being completed in conjunction with those proposed in this SAQP and are detailed in **Table 7**.

6.2 Data Gap 1: AD4 Investigation

As a potential source of secondary PFAS has been identified in AD4 (**Section 4.1**) additional works are proposed to identify (if any) and delineate the source of these concentrations. To address this data gap, the following additional scope of works are proposed:

- The advancement of additional drill holes consisting of:
  - Four (4) additional locations north of the current stormwater channel to characterise filling of the historic Suicide Gully
  - Two (2) additional locations advanced between AD401 and AD402 to delineate the concentrations detected in AD402
  - Two (2) location advanced within the area of windrowed stockpiled (2021) identified in the historical aerial imagery review (**Section 4.1.1**)
  - One (1) location advanced in the western area of AD4 to provide additional characterisation
  - One (1) location advanced within the area formally used for storage of machinery (2012) identified in the historical aerial imagery review (**Section 4.1.1**)
  - Two (2) locations advanced within potentially bunded area identified in the 1999 historical aerial imagery review (**Section 4.1.1**)
- The analysis of two (2) samples per location (nominal) for PFAS, with the analytical schedule discussed in **Section 6.7**

The proposed locations for these additional locations are shown on **Figure F2** and will be advanced to a maximum depth of 10 m below ground level (mBGL). The proposed methodology is detailed in **Section 6.5**.

6.3 Data Gap 2 and 3: Callide A Investigation

Due to the presence of PFAS in the NSP and in surface waters associated with R2 and Dunn Creek, additional works are proposed to identify and delineate potential secondary sources (if any) present within the NSP at Callide A (discussed in **Section 4.2**). Additionally, a data gap is present in the understanding of potential connectivity of groundwater (GHD, 2022) within Ash Dam 2. To address this data gap, the following is proposed:

- The advancement of three (3) additional boreholes through the NSP to delineate the extent of PFAS detected during the initial investigation and assess potential migration pathways (i.e. overland flow). Soil samples will be collected as per the methodology discussed in **Section 6.5**.
- The collection of four (4) surface samples from within the flow path and drainage channel identified in the historical aerial imagery review in 2012 (**Section 4.1.1**)
- Installation of three (3) groundwater bores to investigate a potential seepage pathway between the NSP and R2, consisting of:
  - One (1) bore located at the eastern boundary of the NSP
  - One (1) bore located within the area of permanent vegetation present in the northern portion of Ash Dam 2 identified in the historical aerial imagery review
  - One (1) bore located between Ash Dam 2 and Dunn Creek to identify potential seepage bypass (if any)
  - The newly installed groundwater bores will be incorporated with the quarterly monitoring events (See **Section 6.4**) with the analytical schedule discussed in **Section 6.7**
- The collection of two water samples from the coal reclaim hopper

The proposed locations for these additional locations are shown on **Figure F3** and will be advanced to a maximum depth of 6 mBGL, with perched groundwater expected at between 2-4 mBGL within Ash Dam 2.

6.4 Data Gap 4 to 6: Groundwater and Surface Water Monitoring

Based upon the sampling results collected to date, ongoing groundwater and surface water sampling is recommended to continue at the site to provide ongoing assessment of PFAS within key migration pathways and the receiving environment.

The ongoing monitoring program has been broken into several areas of interest associated with key migration pathways/site areas based on the results of the initial EE investigation (Epic, 2022c). These areas of interest are detailed in **Table 12**.

The sampling methodology is summarised in **Section 6.5**, while the analytical schedule is presented in **Section 6.7** and proposed locations are shown on **Figure F4**. A summary of proposed sampling locations for the proposed sampling schedule is included as **Table T1** (quarterly), **Table T2** (seasonal), **Table T3** (annually) and event based (**Table T4**) in the Tables Appendix.

Table 12. Proposed Groundwater and Surface Water Monitoring Program

Sampling Scope	Area of Interest	Sample Locations	Proposed Sampling Schedule				
			Q1 [Feb/Mar23]	Q2 / Dry Season / Annual Event [May/Jun23]	Q3 [Aug/Sep 23]	Q4 / Wet Season Event [Nov/Dec23]	Rainfall Event (>20mm) [A]
Groundwater	Northern Site Boundary	MW74	X	X	X	X

	Western Seepage Area	SW13		X		X	X
	Callide Creek	SW02 SW12 SW22 SW40	X	X	X	X	X
		SW41		X		X	

Notes:

[A] - event-based sampling is to occur within 72 hours of a rain event >25mm (72 hr) as recorded onsite, with sampling to be limited to one event per month

6.5 Summary of Other Works to Address Data Gaps

6.5.1 Release Point R2 (Data Gap 3)

GHD have been commissioned to undertake dam safety and environmental review of Ash Dam 2 (AD2), and the associated EA licenced discharge location R2. The purpose of the investigation is to identify the key risks presented by AD2 to the environment and license compliance as well as dam safety. The investigation will also consider aspects associated with the detection of PFAS at R2 including surface water and seepage flow paths.

6.5.2 Groundwater Bore Installation Program (Data Gaps 4 and 5)

Based on the findings of the geophysical resistivity survey, CS Energy are proposing to commission a groundwater bore installation program. The recommendations of the geophysical resistivity survey report recommended installation of nine monitoring wells to assess potential seepage pathways. CS Energy's hydrogeologist has reviewed the geophysical survey report and recommended monitoring bore locations and

made recommendation to install thirteen monitoring bores, with bores to be converted to groundwater recovery bores based on the drilling observations and testing.

The bore installation program will target known seepage areas, along with potential additional seepage area (based on the geophysical investigation) to confirm the nature and extent of seepage pathways.

The bore installation program is anticipated to be awarded in the second quarter of 2023.

6.5.3 Northern Boundary Flow Monitoring (Data Gap 6)

CS Energy are currently commissioning the installation of an engineering solution to enable monitoring of water flows entering the site along the northern boundary. The engineering solution proposed includes installation of a v-notch weir, engineered culvert or similar at key watercourses entering the northern site boundary, with dedicated flow monitoring equipment installed to monitor surface water entering the site.

CS Energy have also installed temporary monitoring at existing stormwater culverts at monitoring locations SW33 and SW34. A LoRaWAN LDDS75 Distance Detection Sensor has been installed at each location to provide real time monitoring of water levels within the culverts. Monitoring will be supplemented by collection of regular field measurements (i.e. during/following flow events) to calibrate the sensor readings. Estimate flux volumes will be calculated based on the culvert cross sectional areas and assumptions of flow velocities. Further details on the flow sensors is included in **Appendix B**.

6.5.4 Landowner Sampling Program (Data Gap 7)

CS Energy is continuing their landowner sampling program, which includes sampling of groundwater bores from 84 landowners adjacent to, and downstream of the site. Sampling of landowners commenced in February 2021, with two rounds of sampling currently completed. A third round of landowner sampling is currently underway and due to be completed by mid-2023.

Results from the landowner sampling program, along with water use survey data collected as part of this scope of work and the aquatic biota sampling will be used to inform completion of a HHERA to assess potential risks to human health and ecological receptors.

6.6 Methodology

The proposed sampling methodology for the proposed works detailed in **Sections 6.2, 6.3** and **6.4** are detailed in **Table 13** (soil), **Table 14** (surface water) and
Table 15 (groundwater). Quality assurance and quality control measures are discussed further in **Section 6.9**.

Table 13. Soil Sampling Methodology

Action	Description
Permit to Work	Soil sampling is to be completed under a Site Permit to Work (PTW) and a Digging, Excavation and Building Penetration Checklist. Permits will be obtained in accordance with the CS Energy Permit to Work Manual (CS-PTW-01) and Digging, Excavation and Building Penetration (CS-PTW-HAZ-04) prior to the commencement of works.
Soil Sampling	Soil samples will be collected using a drill rig utilising single-use disposable pushtubes, with drilling terminated at target depth or prior refusal. Soil samples will be collected directly from the pushtube sleeve, directly from the soil surface or from material returned on the hand auger using disposable nitrile gloves, which will be replaced between the collection of each sample. The soil samples will be immediately transferred into laboratory supplied PFAS sampling containers.
Soil Logging	Logging of investigation locations will be conducted in general accordance with the Unified Soil Classification System and AS 1726-1993. Descriptions will be recorded on Epic's standard field log sheets for uniformity in descriptions, presentation and to aid in future interpretations.
Field QA/QC	Field intra- and inter-laboratory duplicates of soil samples will be prepared in the field by collecting blind and split samples from the same depth. Duplicate sample pairs will be collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.

Decontamination	Soil sampling will be completed using dedicated disposable equipment (pushtubes) along with a hand auger where access is limited. Reusable equipment will be decontaminated by hand between each sampling location and event which will include scrubbing thoroughly with a plastic brush and rinsing with clean water followed by a triple-rinse in deionised water. Rinsate samples will be collected from reusable equipment to verify effectiveness of the decontamination.

Table 14. Surface Water Sampling Methodology

Action	Description
Sampling Timing	Surface water sampling on a quarterly, seasonal (wet/dry) or annual basis as detailed in **Table 12**. Additionally, event-based sampling is to occur within 72 hours of a rain event >20mm (recorded onsite) to a maximum of one event per month.
Surface Water Depth Monitoring (Northern Boundary)	Monitoring of surface water flowed is being completed through the installation of LoRaWAN Distance Detection Sensor: LDDS75. It will detect the distance between the measured object (water level) and the sensor. This data will be downloaded and corrected for interpretation, enabling an estimation of surface water flow rates.
Surface Water Sampling	Surface water sampling will be conducted using a decontaminated telescopic sampling pole or by directly submerging laboratory PFAS compliant containers into the water body. Samples will be collected into a laboratory prepared sample bottle attached to the pole with the lid open and lowered with the opening facing downwards into the water. Where possible the sample bottle will be lowered to at least 30cm beneath the water surface and at least 30cm from the base of the water body. Care will be taken not to disturb any sediments during this process. The sample bottle will then then rotated so as to sample water from the centre of the water column. Once full, the bottle will be carefully removed and sealed. Water quality parameters recorded in the field will include dissolved oxygen, temperature, EC, redox potential, turbidity and pH, measured using a calibrated water quality meter.
Field QA/QC	Field intra- and inter-laboratory duplicates of the surface water samples will be collected in the field by collecting blind and split samples from the same depth. Duplicate sample pairs will be collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Sample Labelling, Storage and Transport	All samples will be clearly labelled with unique identification numbers consisting of the date, sample location and samplers' initials. All samples will be bagged and kept in an ice filled Esky prior to dispatch and during transport to the NATA registered laboratory, under chain-of-custody procedures. By prior arrangement with the laboratory, samples will be extracted and analysed as soon as practicable after receipt.
Decontamination	Reusable equipment will be decontaminated by hand between each surface water sampling location. This will include scrubbing thoroughly with a plastic brush and rinsing with clean water followed by a triple-rinse in deionised water. If required, equipment will be scrubbed with a solution of Liquinox (a PFAS approved detergent) followed by a rinse in deionised water.

Table 15. Groundwater Sampling Methodology

Action	Description
Groundwater Bore Installation	Groundwater bore construction will be undertaken by an appropriately licenced driller and be consistent with the Minimum Construction Requirements for Water Bores in Australia (National Uniform Drillers Licensing Committee (NUDLC) 2020).
Aquifer Matrix Sampling	One soil sample will be collected from within the target groundwater aquifer unit from each groundwater bore. Sampling will be completed generally in accordance with **Table 13** (modified based on final drilling method), with analysis to be completed in accordance with **Table 16**.
Groundwater Bore Development	The groundwater bores will be developed using an electric submersible centrifugal pump to remove sediment load and encourage connectivity with the surrounding aquifer matrix. A minimum of five bore volumes will be removed and additional water will be

Action	Description
	removed if physicochemical parameters haven't stabilised [A]. Construction details will be provided in the final report along with bore development data.
Groundwater Bore Surveying	Groundwater bores will be surveyed to enable accurate measurement of standing water levels (SWL) in mAHD and will be completed by a licenced surveyor.
Sampling Timing	Surface water sampling on a quarterly, seasonal (wet/dry) or annual basis as detailed in **Table 12**.
Monitoring Well Gauging	Measurement of the SWL will be completed at each groundwater monitoring well using an electronic interface probe prior to the commencement of purging. SWL will be measured throughout groundwater bore purging to enable the minimisation of drawdown. Due to the pre-existing headworks present on landholder bores (L005-B01, L006-B05, L012-B01 and L021-G01), the SWL will not measured at these locations.
Monitoring Well Sampling – CS Energy and DRDMW wells	Sampling of existing groundwater monitoring wells will be completed utilising appropriate sampling methods based on the findings of the groundwater monitoring network review (Epic 2022c). Sampling methods will include polypropylene HydraSleeves™ or using submersible pump in accordance with the methods outlined below. Sampling methodologies for new groundwater monitoring wells will be determined in accordance with Epic 2022c.
	Sampling of monitoring wells utilising polypropylene HydraSleeves™ will be completed as follows: • Groundwater depth and total well depth will be measured and recorded to determine the appropriate length of bail cord to ensure the HydraSleeve™ is positioned a sleeve-length below the top of the screen interval • The HydraSleeve™ will then be lowered down the well at a slow rate (less than 15cm per second) to avoid water entering the HydraSleeve™ prematurely • The HydraSleeve™ will be left at the depth for at least 24 hours to allow for stabilisation • After the required time to stabilize, the HydraSleeve™ will be recovered by pulling the cord upward at a rate of approximately 30cm per second, allowing the top check valve to open and groundwater within the screened well casing to enter the HydraSleeve™ (the top check valve closes when the HydraSleeve™ is full) • Samples will be collected by transferring the groundwater from the HydraSleeve™ to sample bottles by piercing the sleeve with the provided disposable High Density Poly Ethylene (HDPE) straw • Where suspended solids are observed in the sample, this will be allowed to settle, with sample collected by piercing the sleeve above the settled sediment. Alternatively, sample will be transferred into a suitable laboratory prepared bottle and be allowed to settle before being decanted into a separate laboratory prepared bottle • Samples will be collected directly from the HydraSleeve™ into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged).
	Sampling of groundwater monitoring wells utilising low flow techniques will be completed as follows: • The pumps inlet will be set within the groundwater wells screened interval during purging and sampling • Prior to sampling, monitoring wells will be purged using a submersible pump at a rate <1 L/min • Continuous monitoring with an interface probe will be completed during purging and sampling with pumping rates adjusted to ensure minimal drawdown • Purging continued with frequent measurements of the water quality until parameters stabilised • Sampling of the monitoring wells will be completed using the pump and dedicated HDPE tubing following stabilisation [A]. Samples will be collected directly from the tubing into laboratory prepared bottles. All bottles are to be

Action	Description
	sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged). • Where suspended solids are observed in the sample, the sample will be allowed to settle in the laboratory prepared bottle before being decanted into a separate laboratory prepared bottle
	Sampling of groundwater monitoring wells using a submersible pump will be completed as follows: • The pumps inlet is to be set within the groundwater wells' screened interval during purging and sampling • Prior to sampling, monitoring wells will be purged using a submersible pump. Purging continued with frequent measurements of the water quality until parameters stabilised [A] or the well was purged dry. • Sampling of the monitoring wells will be completed using a pump and dedicated HDPE tubing following stabilisation or following recovery (where purged dry). Samples will be collected directly from the tubing into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged). • Where suspended solids are observed in the sample, the sample will be allowed to settle in the laboratory prepared bottle before being decanted into a separate laboratory prepared bottle
Monitoring Well Sampling – Private Abstraction Wells	Samples at private wells will be collected as follows: • Samples will be collected directly from the bore pump at the nearest tap or suitable outlet. Prior to sampling the pipework will be purged, with a minimum of one well volume purged (if well volume known) or purging for at least 10 minutes prior to sampling. • Samples will be collected directly from the outlet into laboratory prepared bottles. All bottles are to be sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged). • Where suspended solids are observed in the sample, the sample will be allowed to settle in the laboratory prepared bottle before being decanted into a separate laboratory prepared bottle
Field QA/QC	Field intra- and inter-laboratory duplicates of the groundwater samples will be prepared in the field by collecting blind and split samples from the same depth. Duplicate sample pairs are to be collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Sample Labelling, Storage and Transport	All samples will be clearly labelled with unique identification numbers consisting of the date, sample location and samplers' initials. All samples will be bagged and kept in an ice filled Esky prior to dispatch and during transport to the NATA registered laboratory, under chain-of-custody procedures.
Decontamination	Reusable equipment, including the water level meter, and groundwater pumps, will be decontaminated by hand between each groundwater sampling location. This will include scrubbing thoroughly with a plastic brush and rinsing with clean water followed by a triple-rinse in deionised water.

Notes:

[A] - Stabilisation determined based on three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Groundwater Sampling Procedures, April 1996 (ref. EPA/540/S-95/504) including ±0.1 pH, ±3% EC, ±10mv ORP and ± 10% DO.

6.7 Laboratory Analysis

All samples will be submitted to a NATA registered laboratory for analytical testing for PFAS methods (where possible / available) to the lowest available laboratory limit of reporting (LOR) for the specific media. Details on the proposed analytical program is presented in **Table 16**.

Australian Laboratory Services (ALS) has been adopted as the primary laboratory for groundwater, surface water, soil and sediment analysis, with Eurofins MGT (Eurofins) adopted as the secondary laboratory. Both laboratories are NATA accredited for the analytical testing proposed.

All analytical procedures used by the laboratories are in accordance with established internationally recognised procedures such as those published by the United States Environmental Protection Agency (USEPA), American Public Health Association (APHA) and relevant Australian Standards/New Zealand Standards (AS/NZS).

Table 16. Proposed Laboratory Analytical Schedule

Scope	Event Type (As per Section 6.4)	Analytical Suite – Number of Samples			
		PFAS (28 Analyte)	Water[#] / Aquifer Matrix[‡] Characterisation	Total Oxidisable Precursor (TOP) Assay [&]	Leachability – PFAS (28 Analyte) [+]
Groundwater	Quarterly	20 Primary 4 Duplicates	20 Primary 4 Duplicates	-	NA
	Seasonal	28 Primary 6 Duplicates	28 Primary 6 Duplicates	-	NA
	Annually	30 Primary 6 Duplicates	30 Primary 6 Duplicates	-	NA
Surface Water	Quarterly	15 Primary 4 Duplicates	15 Primary 4 Duplicates	-	NA
	Seasonal	21 Primary 5 Duplicates	21 Primary 5 Duplicates	-	NA
	Annually	21 Primary 5 Duplicates	21 Primary 5 Duplicates	-	NA
	Event Based	20 Primary 4 Duplicates	20 Primary 4 Duplicates	-	NA
Soil	Callide A	24 Primary 6 Duplicates	3 Primary	2 Primary	2 Primary
	AD4	26 Primary 6 Duplicates	NA	2 Primary	2 Primary

Notes:

NA – Not applicable

[#] - Water characterisation will include: pH, Electrical Conductivity (EC), Total Dissolved Solids (TDS), Total Suspended Solids (TSS) Cations and Anions (Ca, Mg, Na, K, Cl, SO4, alkalinity, fluoride), dissolved aluminium (Al), iron (Fe) and manganese (Mn), Ammonia, Nitrate, Nitrite, Reactive Phosphorus

‡ - Aquifer matrix characterisation will include (in addition to PFAS): pH, EC, total organic carbon, Fe and Mn

[&] - Samples to be selected based on results from standard analysis, targeting samples with highest concentrations

[+] - Analysis completed following leachability (ASLP) at pH 7.0

6.8 Assessment Criteria

Groundwater and surface water analytical data will be evaluated against relevant assessment criteria with regards to human health and the environment. The adopted assessment criteria, along with guidance documents used to establish the screening/ investigation levels are summarised in **Table 17**.

Concentrations are to be compared to 99% Species Protection Guideline Values due to the proximity of the site to sensitive environmental receptors including Callide Creek and the potentially bioaccumulative nature of PFAS[1]. Results will also be compared to 95% Species Protection Levels to evaluate likely impacts to environmental values, noting that the 99% Species Protection Levels may be below ambient background concentrations.

[1] NEMP 2018, Table 5: The WQG advise that the 99% level of protection be used for ...slightly to moderately disturbed systems'. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife.

Table 17. Adopted Groundwater and Surface Water Assessment Criteria

Media	Potential Contaminant of Concern	Criteria	Potential Receptor	Description	Guideline Source
Groundwater and Surface Water	Sum of PFOS and PFHxS	0.07 µg/L	Human Health	Drinking Water	• Australian Drinking Water Guidelines 6, 2011 (v3.5 August 2018) • PFAS National Environmental Management Plan (v2.0 January 2020)
	PFOA	0.56 µg/L			
	PFOS/PFHxS	2 µg/L		Recreational Water	• NHMRC Guidance on Per and Polyfluoroalkyl substances (PFAS) in Recreational Water (2019) • PFAS National Environmental Management Plan (v2.0 January 2020)
	PFOA	10 µg/L			
	PFOS	0.00023 µg/L	Ecological	99% species protection	• PFAS National Environmental Management Plan (Freshwater)
	PFOA	19 µg/L			
	PFOS	0.13 µg/L		95% species protection	• PFAS National Environmental Management Plan (Freshwater)
	PFOA	220 µg/L			

Soil results are to be compared against relevant assessment criteria with regards to human health and the environment. The adopted assessment criteria, along with guidance documents used to establish the screening/ investigation levels are summarised in **Table 18.**

Table 18. Adopted Soil and Sediment Assessment Criteria

Media	Potential Contaminant of Concern	Criteria	Potential Receptor	Description	Guideline Source
Soil and Sediment	PFOS/PFHxS	1 mg/kg	Human Health	Public Open Space [offsite soils/ sediments]	PFAS National Environmental Management Plan Soil
	PFOA	10 mg/kg			
	PFOS/PFHxS	20 mg/kg		Industrial / Commercial [onsite soils/ sediments]	PFAS National Environmental Management Plan Soil
	PFOA	50 mg/kg			
	PFOS	1 mg/kg	Ecological	Ecological Direct Exposure	PFAS National Environmental Management Plan Interim Soil
	PFOA	10 mg/kg			
	PFOS	0.01 mg/kg		Ecological Indirect Exposure (Residential) [offsite soils/ sediments])	PFAS National Environmental Management Plan Interim Soil
		0.14mg/kg		Ecological Indirect Exposure (Industrial / Commercial) [onsite soils/ sediments]	

6.9 Quality Assurance and Quality Control Program

The field and laboratory quality assurance and quality control (QA/QC) plans to be adopted for the assessment are detailed below. These have been designed to achieve pre-determined data quality objectives that will be assessed with respect to Data Quality Indicators (DQIs). Achieving the DQIs will demonstrate the precision, accuracy, representativeness, completeness and comparability of the data set and that the data set is of acceptable quality to meet the objectives of the assessment.

6.9.1 Field Quality Assurance and Quality Control

The field quality assurance procedures to be adopted and the field quality control samples to be collected during the assessment and the corresponding acceptable control limits are presented in **Table 19**.

Table 19. Field Quality Assurance and Quality Control

Data Type	Comments and Acceptable Control Limits
Field personnel	Use appropriately trained field personnel employing procedures detailed in this assessment.
Field data collection	Site conditions and sample locations accurately surveyed and properly described. Information is to be recorded in field notes. Field notes are appropriately completed and included in the report on the assessment works. Test locations to be recorded on handheld GPS unit, accurate to 3m. Groundwater monitoring wells will be surveyed by a licensed surveyor.
Sample handling (storage and transport)	• Samples will be collected in appropriate sample containers, provided by the laboratory. The sampling containers will be labelled and stored in a sealed container immediately after sampling until receipt by the analysing laboratory • Sample numbers, dates, name of sampler, sample type, preservation and analytical requirements will be recorded on chain of custody (COC) documentation, which will also be delivered to the analytical laboratory • All samples are required to be documented as received by the laboratory intact
Field intra-laboratory duplicates/inter-laboratory duplicates	• Intra- and inter-laboratory duplicates will be collected and analysed at a rate of 1 in every 10 primary samples • Duplicate samples will be labelled so as to conceal their relationship to the primary sample from the laboratory. It is expected that relative percentage differences (RPD's) would be less than 30%, and if not, liaison with the laboratory will be undertaken and samples will be re-analysed, if required

6.9.2 Laboratory Quality Assurance and Quality Control

The laboratory quality aassurance procedures to be adopted and the internal laboratory quality control samples to be analysed and the corresponding acceptable control limits are presented in **Table 20**.

Table 20. Laboratory Quality Assurance and Quality Control

Data Type	Comments and Acceptable Control Limits
Sample Analysis	All sample analysis is to be conducted using the methods detailed by the nominated laboratory, which will implement a quality control plan in accordance with NEMP V2.0 (2020)
Holding Times	Maximum acceptable sample holding times as follows: • pH: 6 hours (field based pH readings will be used instead) • Phosphate, nitrite & nitrate: 2 days • Metal analysis (excluding mercury): 6 months • PFAS: 180 Days
Laboratory Detection Limits	All laboratory detection limits to be less than the assessment criteria.
Laboratory Blanks	• Laboratory blanks to be analysed at a rate of 1 in 10, with a minimum of one analysed per batch • Concentration of analytes to be less than the laboratory detection limits
Laboratory Duplicates	• Laboratory duplicates to be analysed at a rate of 1 in 10, with a minimum of one analysed per batch • RPDs to be less than 50% and if not, liaison with the laboratory will be undertaken and samples will be reanalysed, if required
Laboratory Control Samples (LCS)	• LCSs to be analysed at a rate of 1 in 20 • Control limits: 70 to 130 % is considered as acceptable Recovery and if not, liaison with the laboratory will be undertaken and samples will be reanalysed, if required
Matrix Spikes	• Matrix spikes and matrix spike duplicates prepared by dividing a field sample into two aliquots, then spiking each with identical concentrations of the analytes at a rate of 1 in 20 • Matrix spike control limits: 70–130 % acceptable recovery and if not, liaison with the laboratory will be undertaken and samples will be reanalysed, if required • Matrix spike duplicates: RPDs <50% and if not, liaison with the laboratory will be undertaken and samples will be reanalysed, if required.

6.9.3 Data Quality Indicators

A summary of the data quality indicators (DQIs) and the corresponding measures to be applied for the investigation are presented in **Table 21**.

Table 21. Data Quality Indicators

DQI	Field Measures	Laboratory Measures	Acceptance limits
Precision	Sampling methodologies appropriate and complied with. Collection of duplicate and triplicate samples.	Analysis of: Field duplicate samples (1 in 20) Field triplicate samples (1 in 20) Laboratory duplicate samples	RPD of <50% RPD of <50% RPD of <50%
Accuracy	Sampling methodologies appropriate and complied with.	Analysis of: Method blanks [1] Matrix spikes [1] Matrix spike duplicates [1] Laboratory control samples [1] Laboratory prepared spikes [1] Reagent blanks [1] Reference materials [1]	Non-detect 70 – 130 % RPD of <50% 70 – 130% 70 – 130% Non-detect for CoC Varies
Sensitivity	Sampling methodologies appropriate and complied with	Sample laboratory detection limits. Appropriate laboratory detection limits.	< nominated criteria As set out in this SAQP
Representativeness	Appropriate media sampled according to SAQP. All media identified in SAQP sampled.	All samples analysed according to SAQP	All samples analysed according to SAQP
Comparability	Same sampling methodologies used on each day of sampling. Experienced sampler. Climatic conditions. Same types of samples collected.	Same analytical methods used (including clean-up) Sample laboratory detection limits (justify/quantify if different) Same laboratories and methods (NATA accredited) Same units	As per NEPC (2013) < nominated criteria
Completeness	All critical locations and media sampled. All samples collected and analysed. Sampling methodologies appropriate and complied with. Experienced sampler. Documentation correct. Data completeness.	All critical samples analysed and all analytes analysed according to SAQP Appropriate methods Appropriate laboratory detection limits Sample documentation complete Sample holding times complied with All critical samples analysed and all analytes analysed according to SAQP. Field and Laboratory methodology conducted in accordance with SAQP	As set out in this SAQP

Notes:

[1] These are completed as per internal laboratory methods for internal quality assurance and control procedures.

In the event that a DQI is not met by laboratory analyses, the field observations relating to the nature of the samples will be reviewed, and if no obvious source for the non-conformance is identified, such as an error in sampling, preservation of samples or heterogeneity of samples, liaison with the laboratory will be undertaken in an effort to identify the issue that has given rise to the non-conformance and additional analyses will be undertaken on the original samples, on duplicate samples or on other samples, if required.

If no explanation for the non-conformance is identified, the concentrations for the affected samples will be marked as estimates.

APPENDIX B CS ENERGY NORTHERN BOUNDARY SENSORS

Northern Boundary Sensors

Background

CS Energy wanted to implement a way of monitoring water at the northern boundary of the site. The objective was to estimate the volume of water that was entering the site via conventional waterways or other.

It was decided that LDDS75 sensors would be installed at appropriate locations to gather the data required.

Technology

The LDDS75 is a LoRaWAN Distance Detection Sensor for Internet of Things solution. It is used to measure the distance between the sensor and a flat object. The distance detection sensor is a module that uses ultrasonic sensing technology for distance measurement, and temperature compensation is performed internally to improve the reliability of data.

The LDDS75 can be applied to scenarios such as horizontal distance measurement, liquid level measurement, parking management system, object proximity and presence detection, intelligent trash can management system, robot obstacle avoidance, automatic control, sewer, bottom water level monitoring, etc.

It detects the distance between the measured object and the sensor and uploads the value via wireless to LoRaWAN IoT Server.

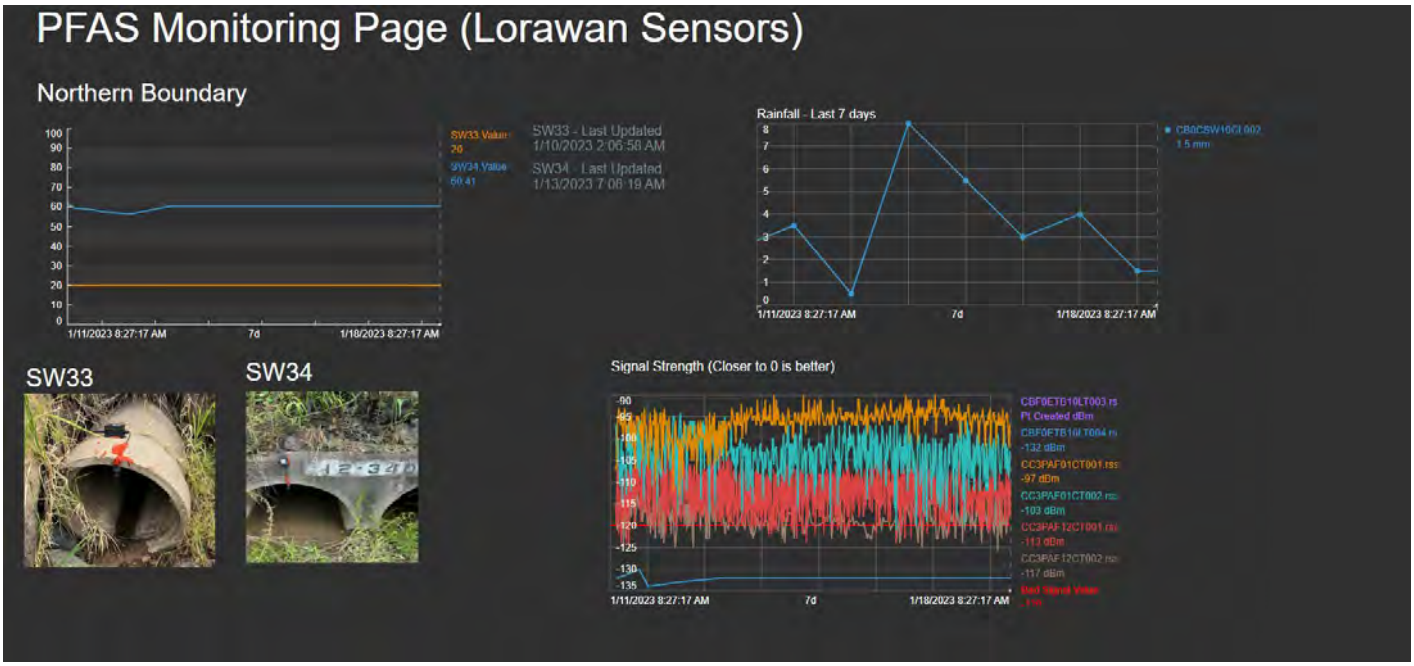
The LoRa wireless technology used in LDDS75 allows device to send data and reach extremely long ranges at low data-rates. It provides ultra-long range spread spectrum communication and high interference immunity whilst minimizing current consumption.

LDDS75 is powered by 4000mA or 8500 mA Li-SOCI2 battery; It is designed for long term use up to 10 years*.

Each LDDS75 pre-loads with a set of unique keys for LoRaWAN registrations, register these keys to local LoRaWAN server and it will auto connect if there is network coverage, after power on.

Locations

The sensors were strategically placed at surface water monitoring sites SW33 and SW34 as there are culverts present at those locations. That allows us to measure volumes of water entering the site given we will have data from both the sensor as well as the dimensions of the culvert piping.



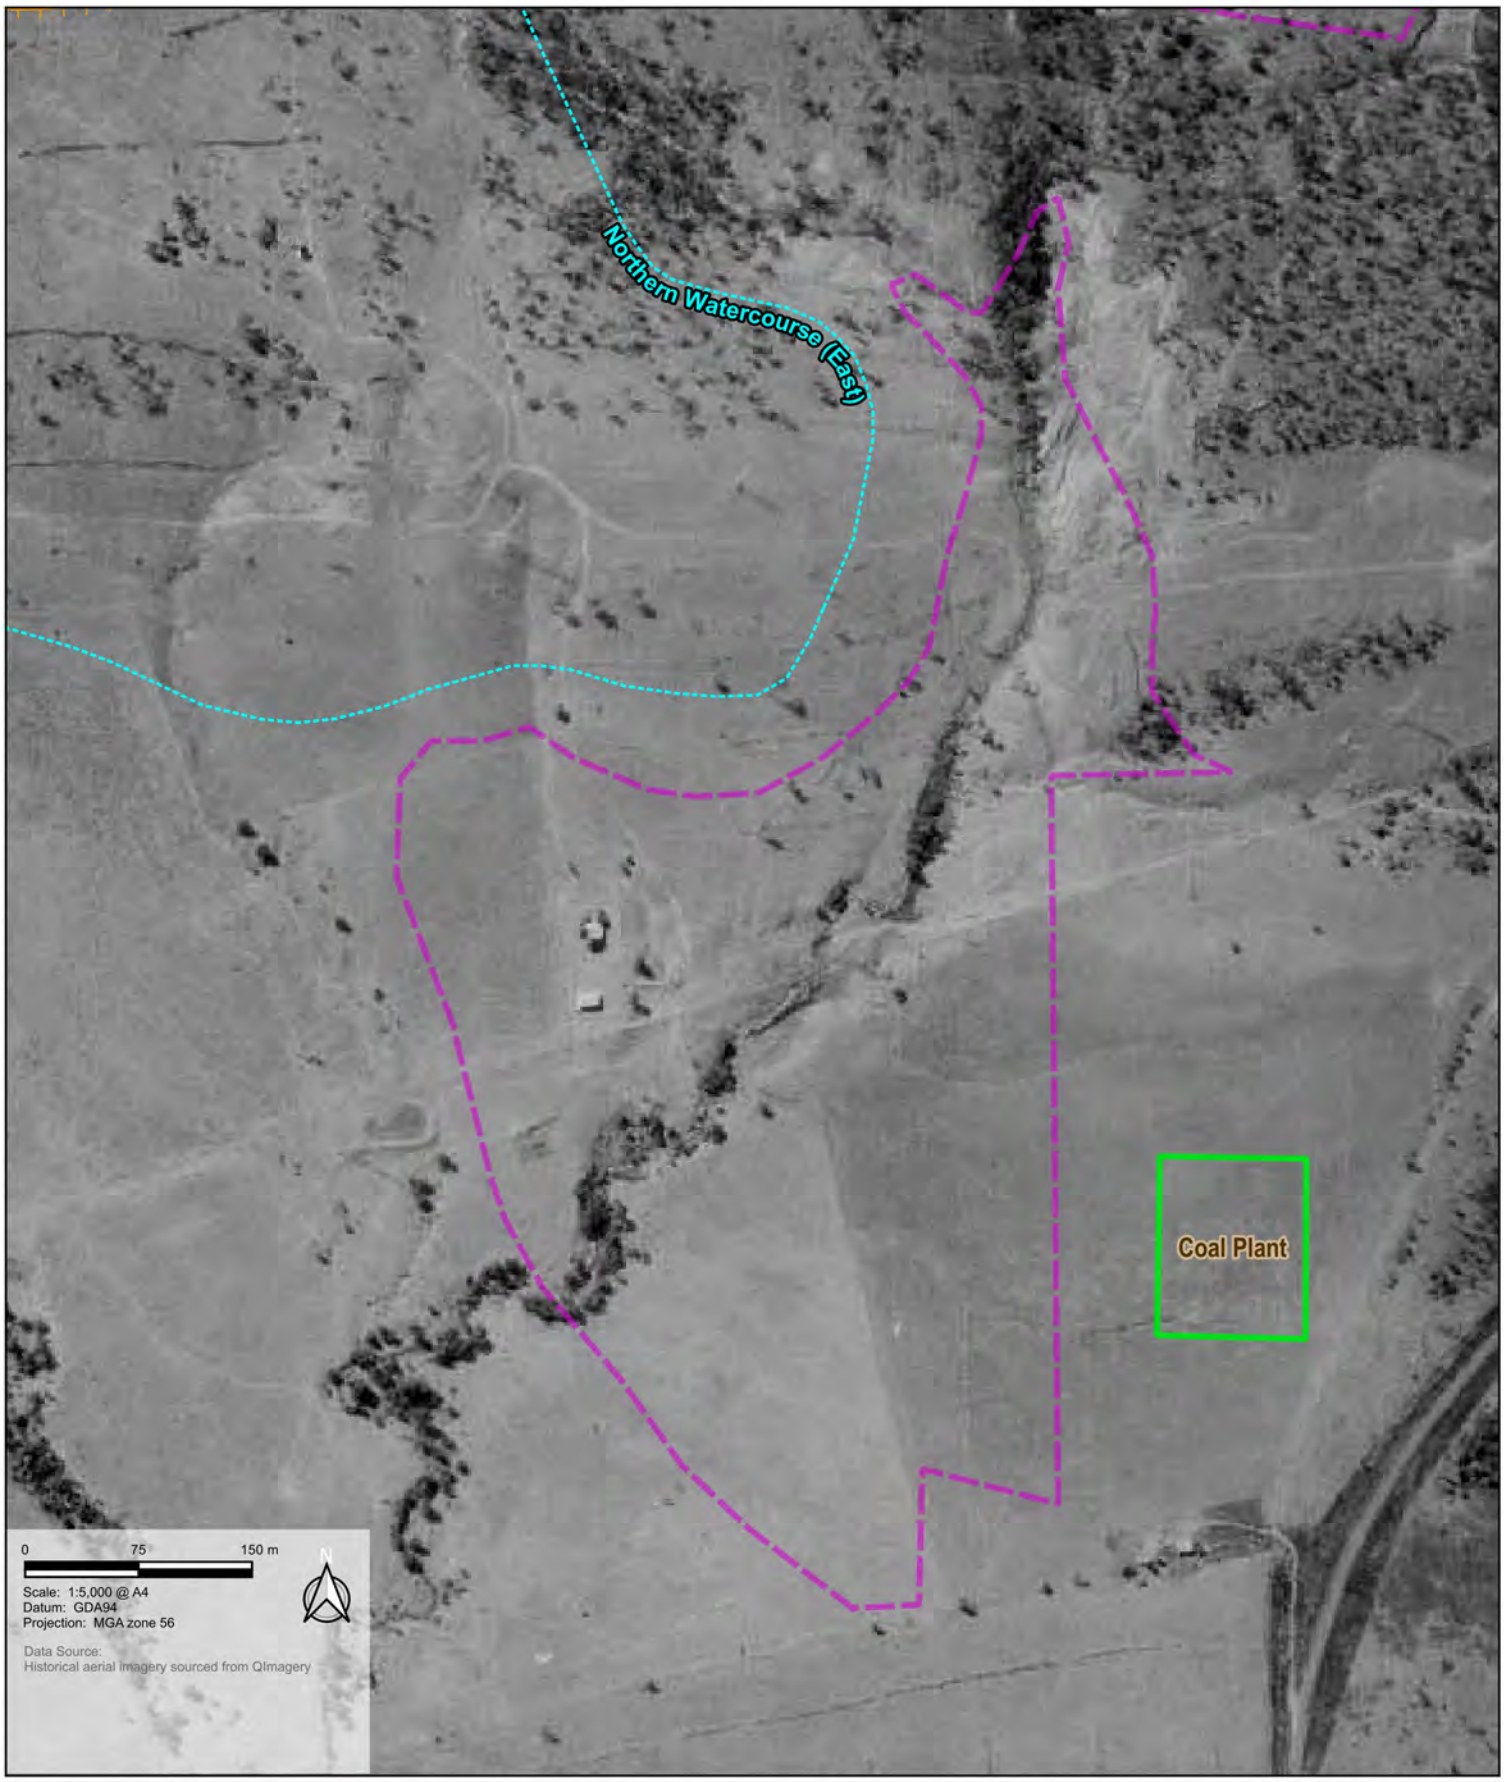
The locations are detailed in the following table.

Site name	SW33
Coordinates	S 24° 20’04.49” E 150° 36’49.47”
Photos	
Diameter of culvert	61cm

Site name	SW34
Coordinates	S 24° 21’52.40” E 150° 35’58.18”
Photos	
Diameter of culvert	111cm

Data Collection

Data is currently collected at 20-minute intervals. This can be altered to feed data more often however this would decrease the battery life expectancy of the unit. The data is presented in the following format. It includes the depth of water (mm) by time. Rainfall over the same period is presented next to it as well as the signal strength and photos of sensor locations.



The link to access the data is:
https://titanvis.csenergy.com.au/PIVision/#/Displays/3892/PFAS-Monitoring

Limitations & Calibration

The signal strength is currently not at its best due to the distance it must travel to send data back to CS. We are in the process of installing a new gateway in a more central location will increase the signal strength and thus the confidence of the data.

On a fortnightly basis, or whenever it rains, a member of the environment team will be going out to collect a field measurement of water depth where the probe is placed. This will allow us to verify the readings the sensor is feeding us.

B22096_Callide Power Station Ecological Report Primary_V4-0	Ecological Assessment of Callide Creek Catchment	LA	JC

EXECUTIVE SUMMARY

This report presented the finding of the aquatic ecological assessment of the Callide Creek catchment upstream and downstream of Callide Power Station (CPS). The survey involved the collection of aquatic fauna and analysis of biota tissue to inform human and ecological health risk assessments regarding per and poly fluorinated alkyl substance (PFAS) compounds and other chemicals (metals/metalloids and fluoride). The survey also aimed to determine the aquatic values of the assessed waterbodies. Aquatic values are defined as the intrinsic values of aquatic ecosystems, habitat and wildlife in waterways and riparian areas, for example, biodiversity, ecological interactions, plants, animals, key species (such as turtles, platypus, seagrass and dugongs) and their habitat, food and drinking water (DEHP, 2011).

key species (such as turtles, platypus, seagrass and dugongs) and their habitat, food and drinking water.

The survey was conducted in early February 2023, and assessed the biota tissue contaminants, habitat condition, macroinvertebrate community and aquatic biota (macrocrustaceans, fish and aquatic reptiles), of each site. Results were compared between sites and against relevant guidelines.

The habitat condition, aquatic biota, and macroinvertebrate communities varied between control/reference sites and test sites. Upstream of Callide Dam within Callide Creek habitat condition was excellent and aquatic biota and macroinvertebrates were abundant and diverse for this system. Downstream some disturbance was evident based on the state of the habitat, water quality, and macroinvertebrate assemblages. Habitat quality overall was in good to excellent condition, with most sites limited due to lower water depth, availability of micro and macrohabitats and by high fine sediment content. Lake Callide, a larger water body with sections of sheltered habitat was able to support similar, and in some cases more diverse aquatic biota and macroinvertebrates communities

than the comparable reference site Lake Kroombit. Available water quality data was scarce, however showed that site AB11 had high conductivity (2,631µS/cm) and that dissolved oxygen (%saturation) was relatively low across all sites, in particular downstream of Lake Callide.

PFOS was detected in biota samples at sites on Callide Creek both upstream and downstream of the CPS with most concentrations being above human and ecological health guidelines levels. No PFOS was detected in biota samples from Lake Callide or within Lake Kroombit. PFOS concentrations appear to increase with increasing distance downstream of CPS, with the highest concentrations recorded at the furthest downstream site. Concentration of metals and fluoride in biota samples did not show an obvious trend between control/reference and test sites. Where guidelines (generally expected levels) were available most metals/metalloids concentrations were below respective guidelines, except for zinc. However, zinc concentrations were above guideline levels regardless of species and site.

1. INTRODUCTION

1.1 BACKGROUND

In December 2021, CS Energy Limited (CS Energy) was issued with a notice to conduct or commission an Environmental Evaluation (EE) to investigate and assess the source, cause and extent of any actual or potential environmental harm resulting from the historical use of Aqueous Film Forming Foam (AFFF) at the Callide Power Station (hereafter referred to as CPS). A Sampling Analysis and Quality Plan (SAQP) was prepared by Epic Environmental on 28 February 2022 (Epic Environmental, 2022) to address Requirement 3 of the EE.

The SAQP outlined the need to conduct a desktop review to facilitate the design of an appropriate aquatic biota sampling that would adequately address the requirements of the EE pertaining to human and/or ecological health risks arising from human consumption of aquatic biota as well as bioaccumulation within the food chain.

Epic completed the desktop review in accordance with the SAQP and as an outcome of this review designed a biota sampling strategy which was then implemented by Hydrobiology in 2023.

1.2 SCOPE

Hydrobiology was contracted to conduct the fieldwork and reporting as stipulated by the SAQP, including:

- Habitat assessments;
- Macroinvertebrate sampling; and

- Collection of aquatic biota to inform the human and ecological health risk assessments. The original scope of works included the assessment of PFAS; however Hydrobiology were requested to subsequently include the assessment of the following parameters, including:
  - Metals and metalloids.
    - arsenic, barium, boron, chromium, copper, lithium, molybdenum, selenium, strontium, thorium, uranium, vanadium, zinc.
    - Fluoride.

1.3 LOCATION AND HISTORY

CPS is located within the Callide Basin in the Banana Shire region of Queensland, approximately 10 km east of the Biloela township and approximately 110 km south of Rockhampton. CPS comprises three coal-fired power plants supplied by the nearby Callide mine (Figure 1-2). The first, Callide A, was opened in 1965 but was decommissioned in 2001, except for a single unit which was used to demonstrate carbon capture technology and was decommissioned in 2016. The other two power stations, Callide B and Callide C, remain active. Callide B was commissioned in 1988 and is owned by CS Energy, whereas Callide C was commissioned in 2001 and is owned in a 50/50 venture between CS Energy and IG Power (formerly known as InterGen).

1.4 CATCHMENTS AND WATECOURSES

The study area is located within the Callide Creek catchment within the Dawson River sub-basin. With the exception of one site, all sites are located within Callide Creek, upstream, downstream and within Callide Dam. The remaining site is located within Kroombit Dam on Kroombit Creek.

A map of the project location and site positions are provided in Section 2.2.

1.5 LOCAL CLIMATE

The climate for the area is typical of the region, with high daytime summer temperatures and mild winters (Figure 1-1). Rainfall is variable, with most rain falling during the warmer months from mid-October to mid-March. Above average rainfall occurred in the months preceding monitoring in February 2023. In the weeks leading up to the survey, a total of 31 mm was recorded, while a total of 19 mm of rain was recorded within the survey period (30th January to 3rd February 2023).

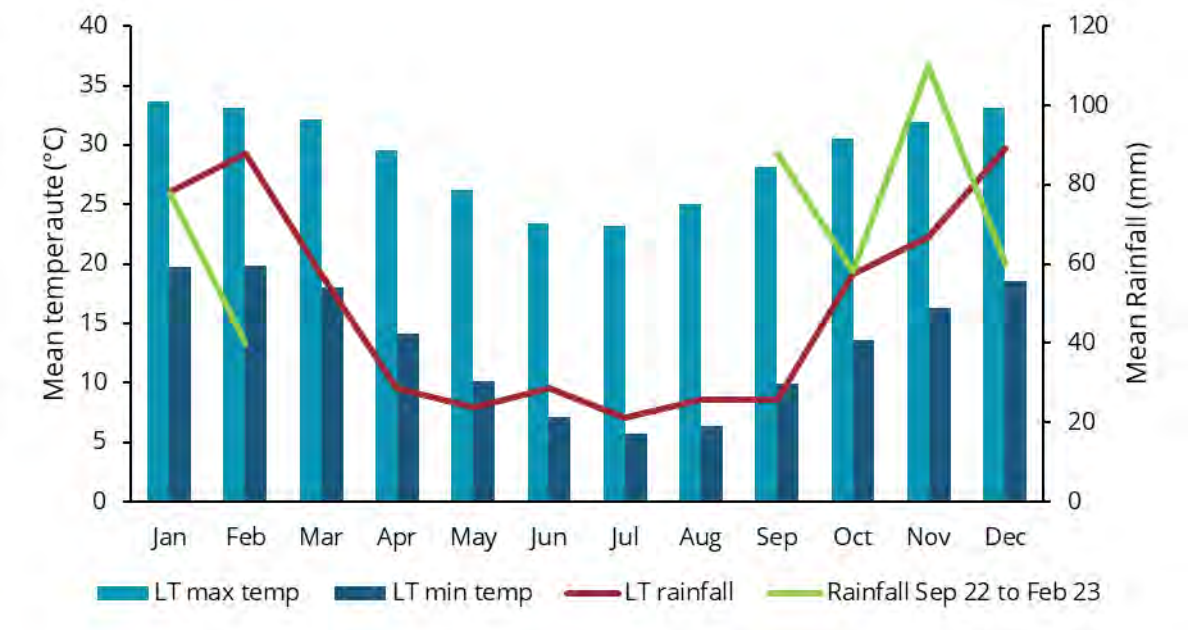

Figure 1-1 Long term (LT) monthly mean rainfall, maximum and minimum temperature statistics from the Biloela climate station 039290 (BOM, 2023).

Figure 1-2 CPS with infrastructure and other points of interest

1.6 ENVIRONMENTAL VALUES

EVs are the qualities of waterways that need to be protected from the effects of pollution, waste discharges and other threats (such as runoff from agricultural lands) to ensure aquatic ecosystems are healthy and the waterways continue to provide essential ecosystem services. There are a range of EVs applicable to waterways in Queensland. These include the value of the waterways to aquatic ecosystems, primary industries, recreation and aesthetics, drinking water, industrial uses as well as cultural and spiritual values. DEHP (2011) defines EVs for the Callide Creek Catchment within the Dawson River Sub-Basin in which CPS is located. DEHP (2011) sets out a framework for EVs which are defined for tributaries and regulated and unregulated waters of Callide Creek Catchment. Those most relevant to the survey sites are the Callide Creek tributaries (developed) and Upper Kroombit Creek and tributaries (Table 1-1).

Table 1-1 Prescribed environmental values of Callide Creek and tributaries (developed).

Label	Environmental Value	Description	Callide Creek and tributaries—developed areas	Upper Kroombit Creek and tributaries
	Aquatic ecosystem	The intrinsic value of aquatic ecosystems, habitat and wildlife in waterways, waterholes and riparian areas, for example, biodiversity, ecological interactions, plants, animals, key species and their habitat, food and drinking water. EV were designed for the protection of moderately disturbed systems (i.e. 95% biota protection trigger).	✓	✓
	Irrigation	Suitability of water supply for irrigation, for example, irrigation of crops, pastures, parks, gardens and recreational areas.	✓	✓
	Farm supply	Suitability of domestic farm water supply, other than drinking water. For example, water used for laundry and produce preparation.	✓	✓
	Stock watering	Suitability of water supply for production of healthy livestock.	✓	✓
	Aquaculture	Health of aquaculture species and humans consuming aquatic foods (such as fish and prawns) from commercial ventures.		✓
	Human consumption	Health of humans consuming aquatic foods, such as fish and prawns, from natural waterways.	✓	✓

Label	Environmental Value	Description	Callide Creek and tributaries—developed areas	Upper Kroombit Creek and tributaries
	Primary recreation	Health of humans during recreation which involves direct contact and a high probability of water being swallowed, for example, swimming, diving and water-skiing.	✓	✓
	Secondary recreation	Health of humans during recreation which involves indirect contact and a low probability of water being swallowed, for example, wading, boating, rowing and fishing.	✓	✓
	Visual appreciation	Amenity of waterways for recreation which does not involve contact with water. For example, walking and picnicking adjacent to a waterway.	✓	✓
	Drinking water	Suitability of raw drinking water supply. This assumes minimal treatment of water is required, for example, coarse screening and/or disinfection.	✓	✓
	Industrial	Suitability of water supply for industrial use, for example, food, beverage, paper, petroleum and power industries, mining and minerals refining/processing. Industries usually treat water supplies to meet their needs.	✓	
	Cultural and spiritual values	Cultural, spiritual and ceremonial values of water means its aesthetic, historical, scientific, social or other significance, to the past, present or future generations.	✓	✓

2. METHODS

2.1 MONITORING ASPECTS

Sampling was conducted at nine sites following the methods specified in the Sampling Analysis and Quality Plan (SAQP) (Epic Environmental, 2022) and under the following codes of practice and State or Commonwealth guidelines:

- DES (2018) – *Deciding aquatic ecosystems indicators and local water quality guidelines;*
- DES (2018) – *Monitoring and Sampling Manual;*
- DES (2014) - *Receiving Environment Monitoring Program guideline - For use with Environmental Relevant Activities under the Environmental Protection Act (1994);*
- Department of Natural Resources and Mines (DNRM) (2001). *Queensland, Australian River Assessment System (AUSRIVAS) Sampling and Processing Manual;*
- DEHP (2011) - *Environmental Protection (Water) Policy (2009) Callide Creek Catchment Environmental Values and Water Quality Objectives Relevant state and national standards*; and
- (Queensland Health, n.d.) - *Guideline for sampling and analysis of seafood suitable for human health risk assessments of PFAS contamination*.

Details regarding sample collection methods, analysis and QA/QC approaches for each monitoring aspect are discussed in Appendix B. Relevant guideline values and explanations of macroinvertebrate analysis (including definitions of indices and AUSRIVAS scores) are also discussed in Appendix A. The results of implemented QA/QC are discussed in Appendix B.

2.2 SURVEY LOCATIONS

As part of the scope of works (Epic Environmental, 2022), nine sites within and adjacent to the CPS were surveyed during the 30th January to 3rd February 2023 period (see Table 2-1 and Figure 2-1).

Sites were positioned spatially over a longitudinal grade and separated by treatments (test, control, and reference sites). Test sites were positioned downstream of CP, therefore potentially impacted. Control sites were positioned upstream from CP within the Callide Creek, away from potential impacts. Reference sites were positioned in the same basin as control and test sites but in a separate catchment, therefore providing context of PFAS levels withing the wider region.

Table 2-1 Site names, treatments and locations. Coordinates provided in Geodetic Datum of Australia (GDA) 2020.

Site	Waterway/region	Treatment	Habitat	Coordinates	
				Latitude	Longitude
AB9	Lake Kroombit	Reference	Lacustrine	-24.4156	150.773
AB1	Upstream Callide Creek	Control	Riverine	-24.3271	150.6762
AB2	Lake Callide	Test	Lacustrine	-24.3580	150.6258
AB3	Lake Callide	Test	Lacustrine	-24.3687	150.6161
AB4	Downstream Callide Creek	Test	Riverine	-24.3641	150.6072
AB5	Downstream Callide Creek	Test	Riverine	-24.3793	150.5604
AB6	Downstream Callide Creek	Test	Riverine	-24.3702	150.5307
AB7	Downstream Callide Creek	Test	Riverine	-24.3593	150.4987
AB8	Downstream Callide Creek	Test	Riverine	-24.3462	150.4761

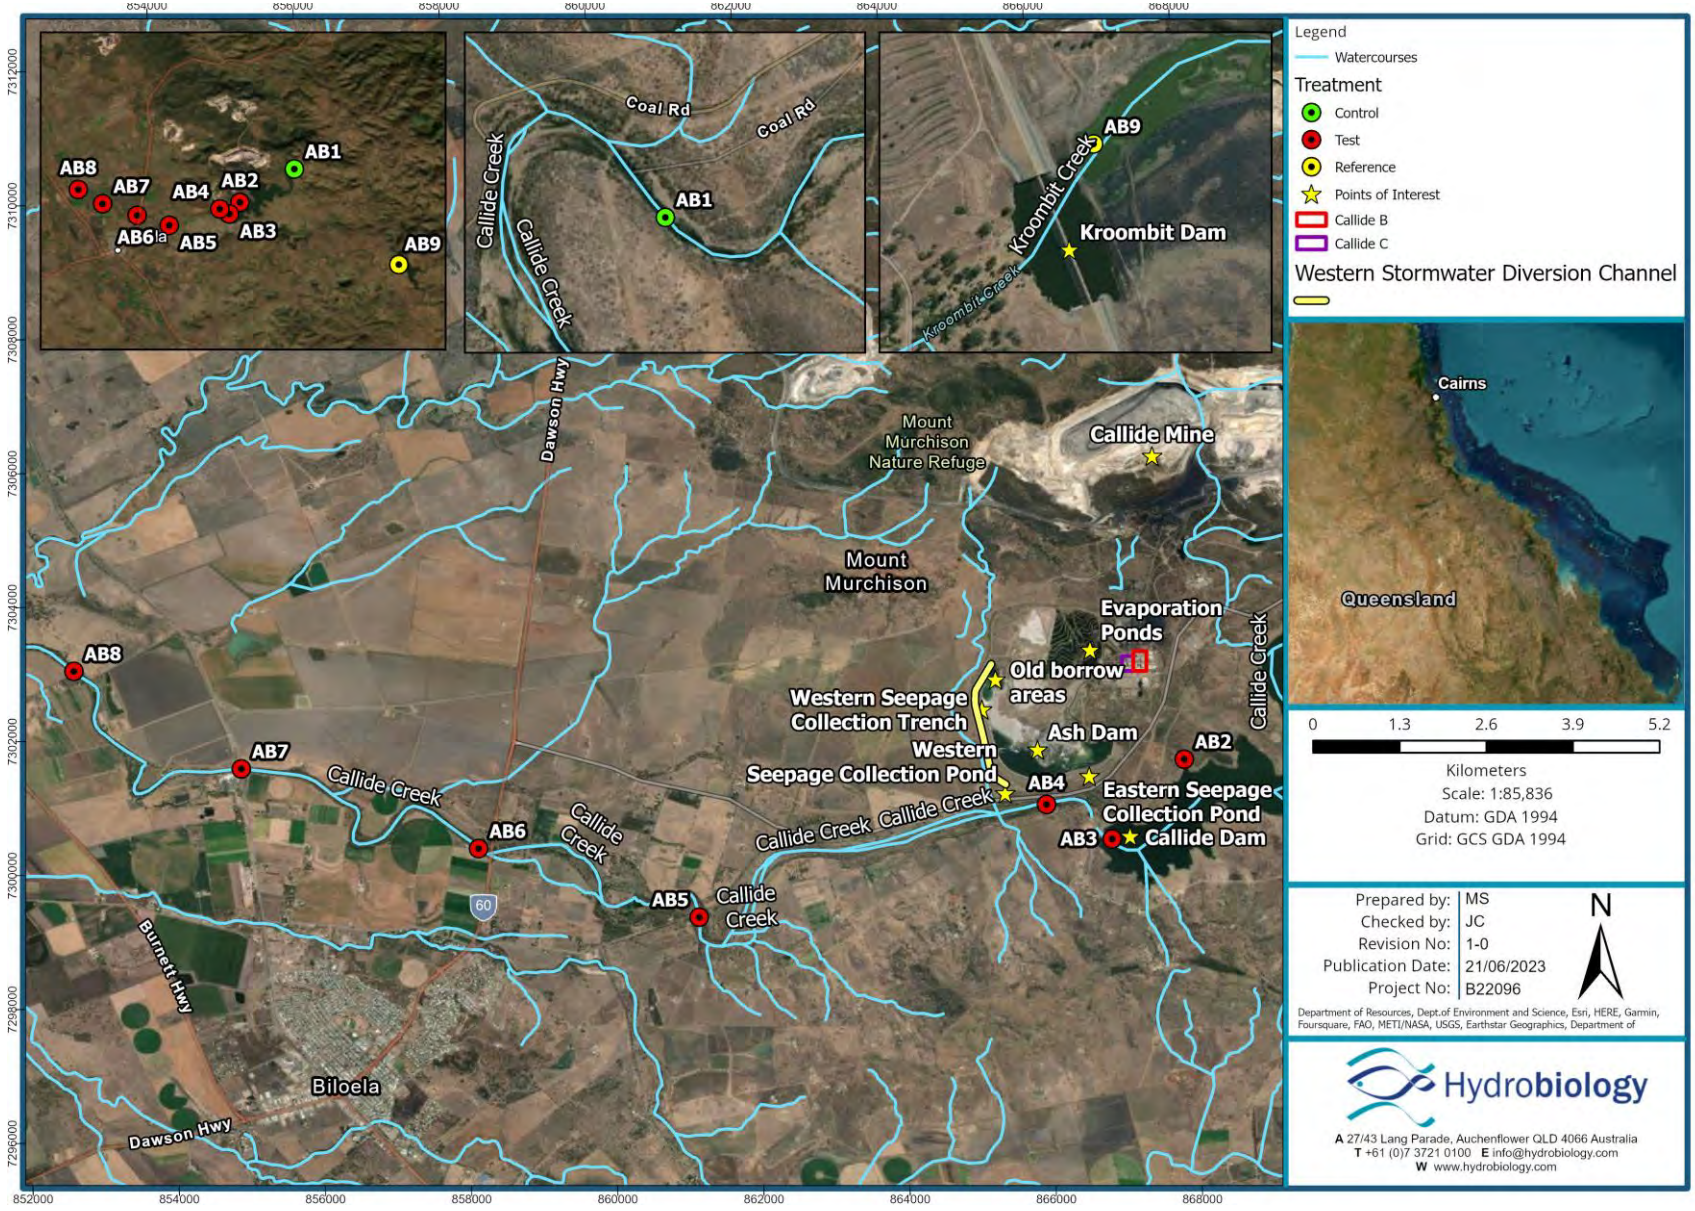

Figure 2-1 Monitoring sites with watercourses, infrastructure and other points of interest

3. RESULTS AND DISCUSSION

Field datasheets are displayed in Appendix C.

3.1 HABITAT

Site photos and descriptions can be found in Table 3-1. Results are presented spatially over a longitudinal gradient.

3.1.1 HABITAT CONDITION

The study area contained a mix of lacustrine and riverine habitats, which required a mix of traditional and adjusted habitat assessments. Most sites were riverine sites and could be assessed using the traditional habitat assessment defined by AUSRIVAS, however AB2, AB3 and AB9 were assessed under a different metric. Regardless of how the scores were classified, all sites were graded as being in poor, fair, good or excellent condition, however the required scores for each band varied between sites (see Appendix A for more details).

Habitat condition of all riverine sites ranged from good to excellent (Figure 3-1). The habitat condition of the control site AB1 was scored “excellent” whereas all sites downstream of Lake Callide were scored as “good”. In comparison to AB1 sites downstream were largely limited by decreased bottom

substrate variability (greater proportion of fines content), high embeddedness (i.e., minimal interstitial spacing), the limited depth and variability of macrohabitat (i.e. restricted to pools while riffles and runs were absent) and the coverage of streamside vegetation due to clearing.

Wetland sites AB9 and AB2 were in good condition, however site AB3 was classified as fair. All sites were hindered by lack of substrate variability, macrohabitat availability and the dominance of grasses as the primary riparian vegetation.

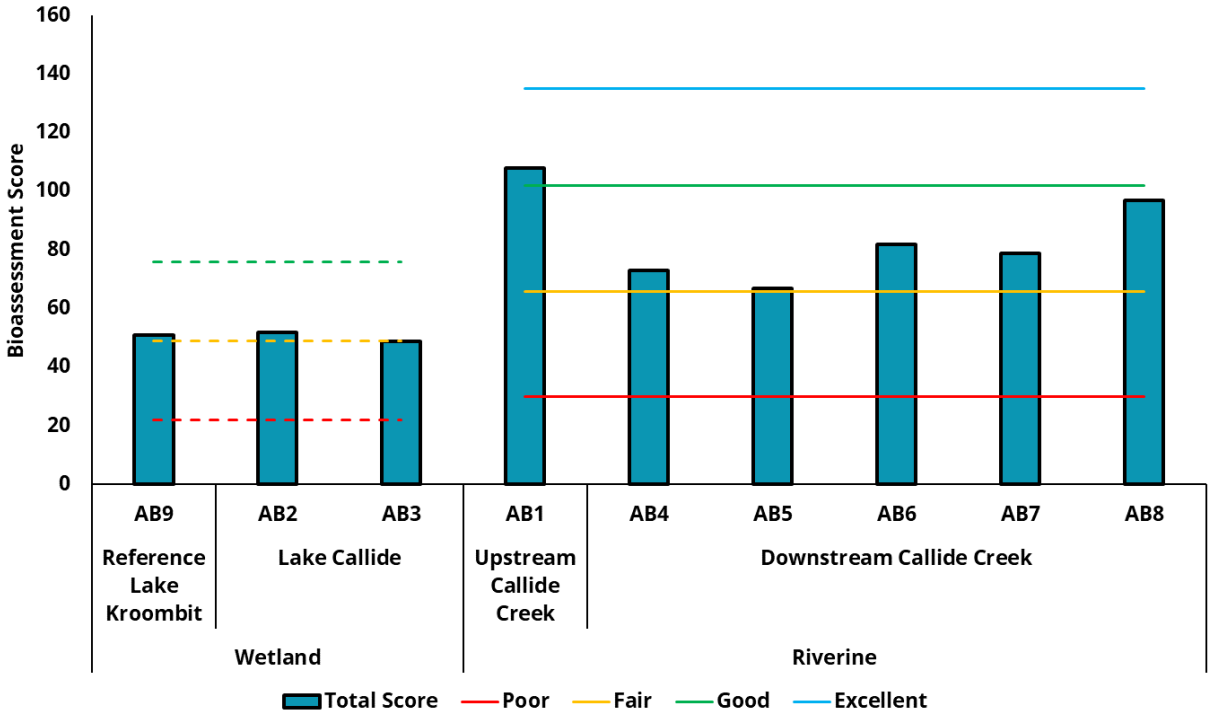

Figure 3-1 Habitat assessment scores of wetland (left) and non-wetland (right) sites with bands indicating the upper limit of each condition grade. Solid lines indicative of River Bioassesmment Program grades, dashed lines indicative of adapted scores for wetland sites.

3.1.2 BANKS STABILITY

The bank stability of all sites were classified as good to excellent. Most banks were stable or moderately stable, with little evidence of erosion. Some sites however had reduced streambank cover. The streambank surfaces of all sites were at least 50% covered in vegetation, gravel or larger material.

3.1.3 BED STABILITY

Overall, bed stability of all sites ranged from good to excellent, with little evidence of scouring and some deposition of fine sediment. Most test sites had low to loose compaction of the bed material, with little to no grading, packing, structure or overlapping of substrate particles meaning it could be easily dislodged, except for test site AB8 which had moderate bed compaction. Control site AB1 was the only site to record tight compaction of the bed material.

For most sites, bed stability could be linked to the substrate composition which was overall dominated by silt/clay sediments (Figure 3-2). In contrast, AB1 which contained tight compaction of the bed material contained larger particles of sand, pebbles and cobble, exposed bedrock as well as silt/clay sediment. While silt/clay was less prevalent at site AB8, larger sediments were more abundant, making it more similar to upstream conditions at AB1.

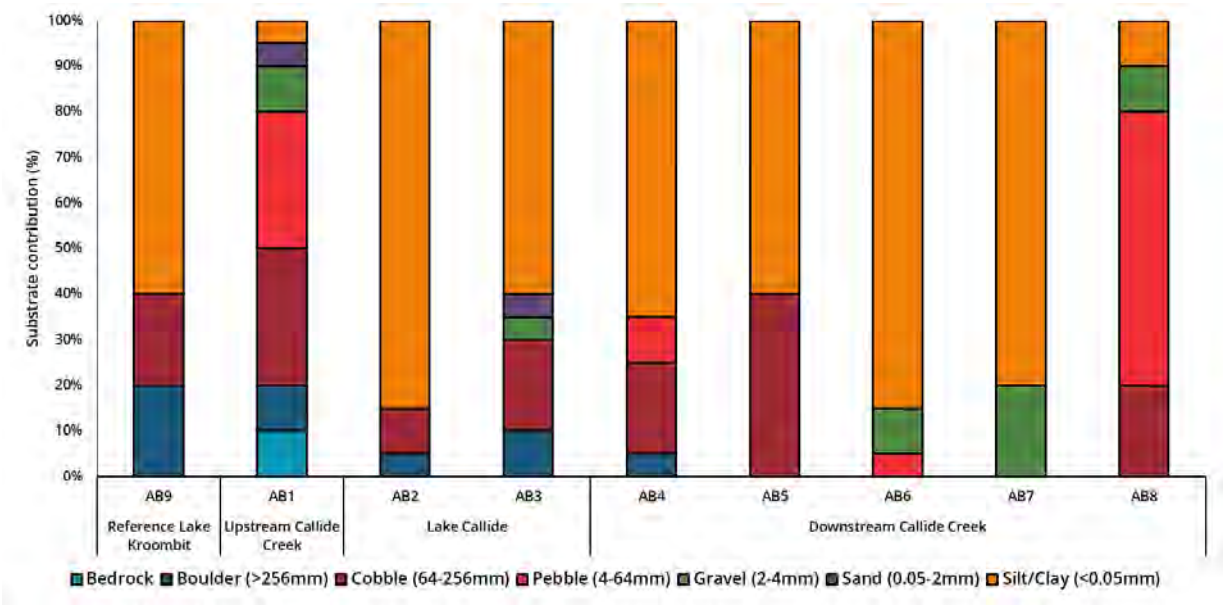

Figure 3-2 Particles size contribution to overall substrate.

3.1.4 RIPARIAN VEGETATION

The riparian vegetation associated with lake habitats was largely cleared, with trees often scarce and the banks dominated by grasses and/or bare ground (Figure 3-3). Exotics grass and pasture species were present at most sites to some degree. At Callide Creek sites, clearing was reduced and the riparian vegetation still contained patches of trees interspersed by grasses and shrubs.

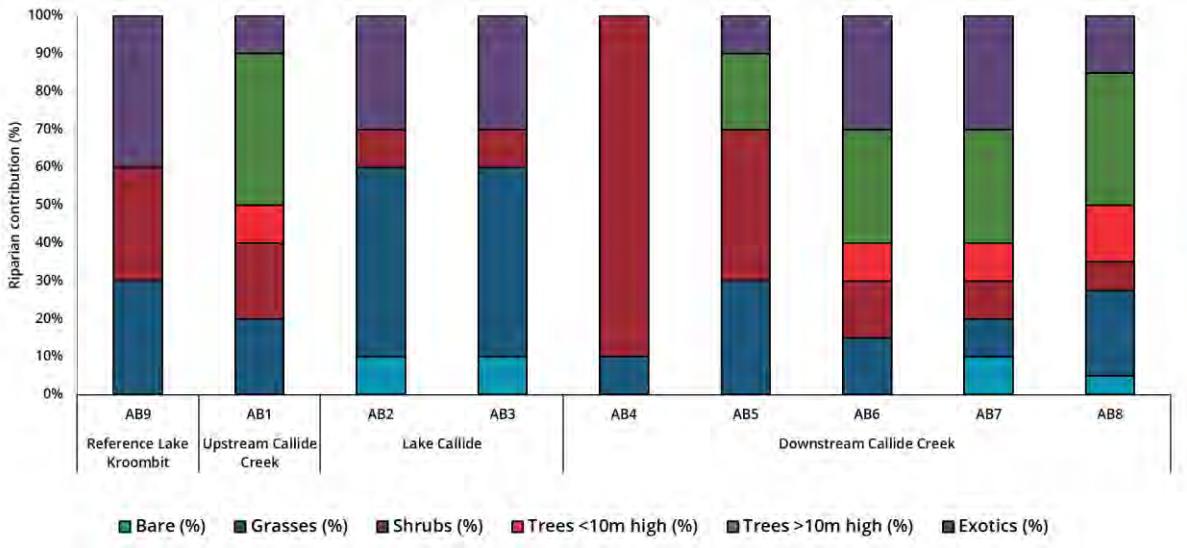

Figure 3-3 Riparian vegetation contribution (%).

3.1.5 MACROHABITAT

Macrohabitat lacked diversity across each site, with most sites comprised of only one macrohabitat (Figure 3-4). Downstream sites AB7 and AB8 were most like the control site as rocky pool habitat was present. All other sites were comprised of sandy/silt pools.

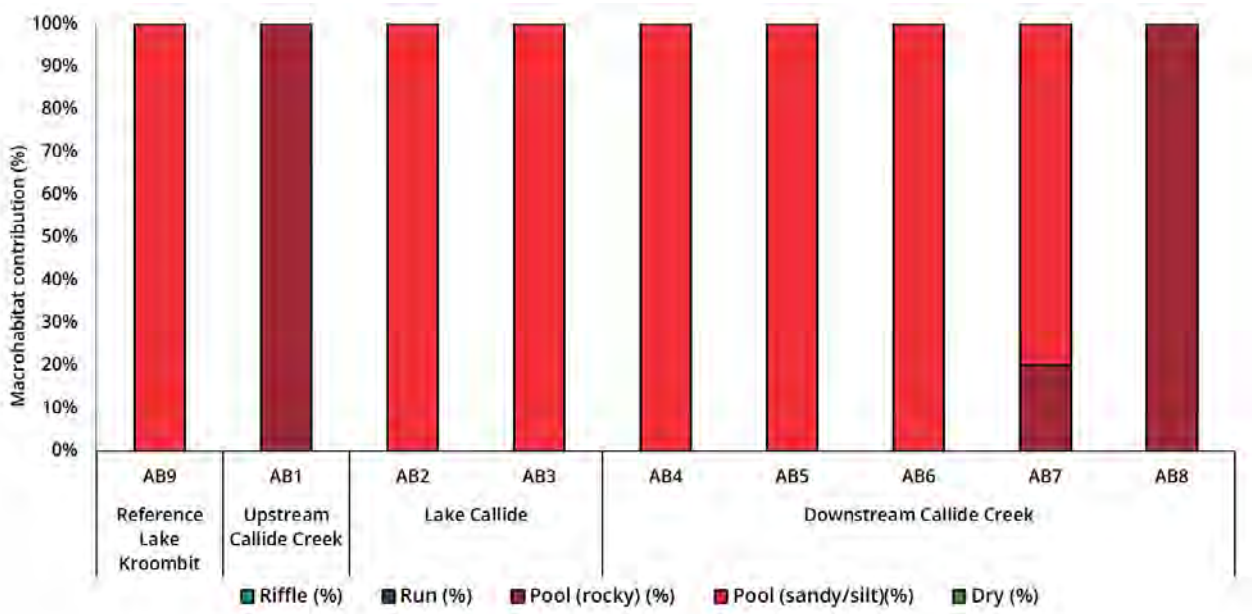

Figure 3-4 Macrohabitat contribution.

3.1.6 MICROHABITAT

Microhabitat was predominantly provided by small woody debris (SWD) and detritus. Periphyton and large woody debris (LWD) were each present in smaller quantities but also commonly present (Figure 3-5). Undercut banks were present at three sites (AB1, AB6 and AB8). Some microhabitat was also provided by the macrophytes, and algae present to varying degrees.

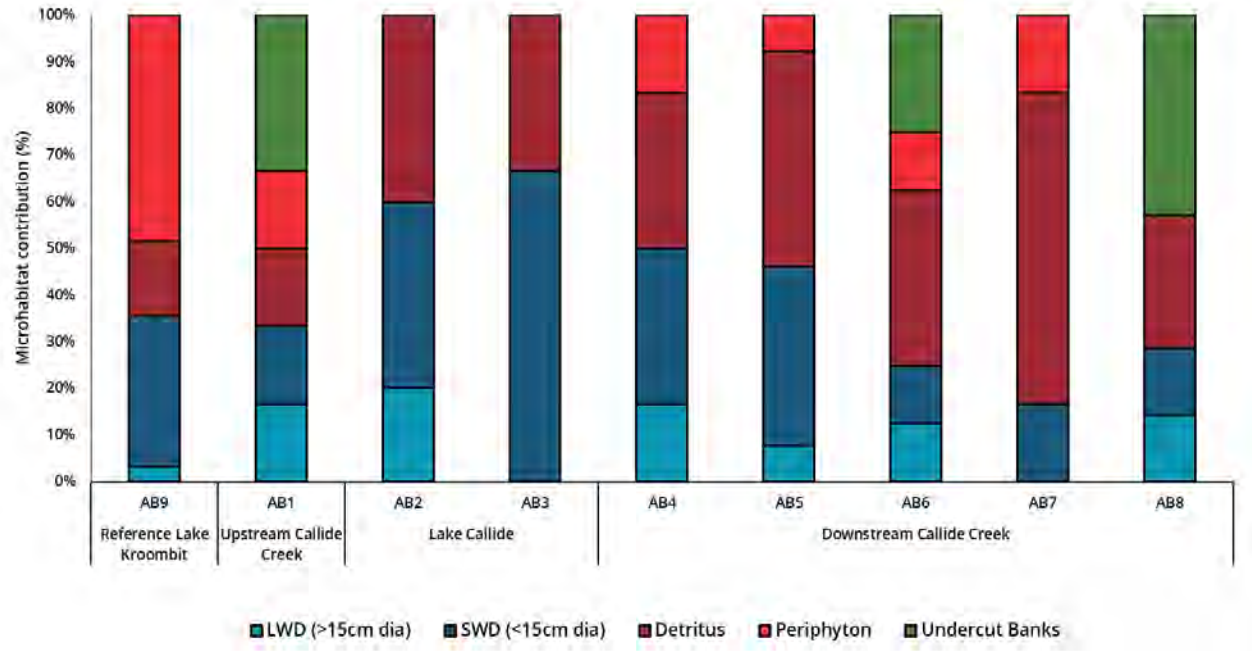

Figure 3-5 Microhabitat contribution

3.1.7 MACROPHYTES

Macrophytes were present at all sites, and they were largely found along edge habitats; however some macrophytes were also present within the pool habitat (Figure 3-6). Several downstream creek sites were dominated by either *Hydrilla* sp. or *Typha* sp. but typically also had other species present. The reference site at Lake Kroombit was dominated by *Persicaria sp.* whereas within Lake Callide taxa such as charophytic algae were more common. The most diversity and species evenness was observed at the upstream Callide Creek control site AB1 where most taxa found at across the rest of the study area were present. Taxa absent from this site were *Persicaria* sp., *Nymphoides* sp., and *Ceratophyllum* sp.

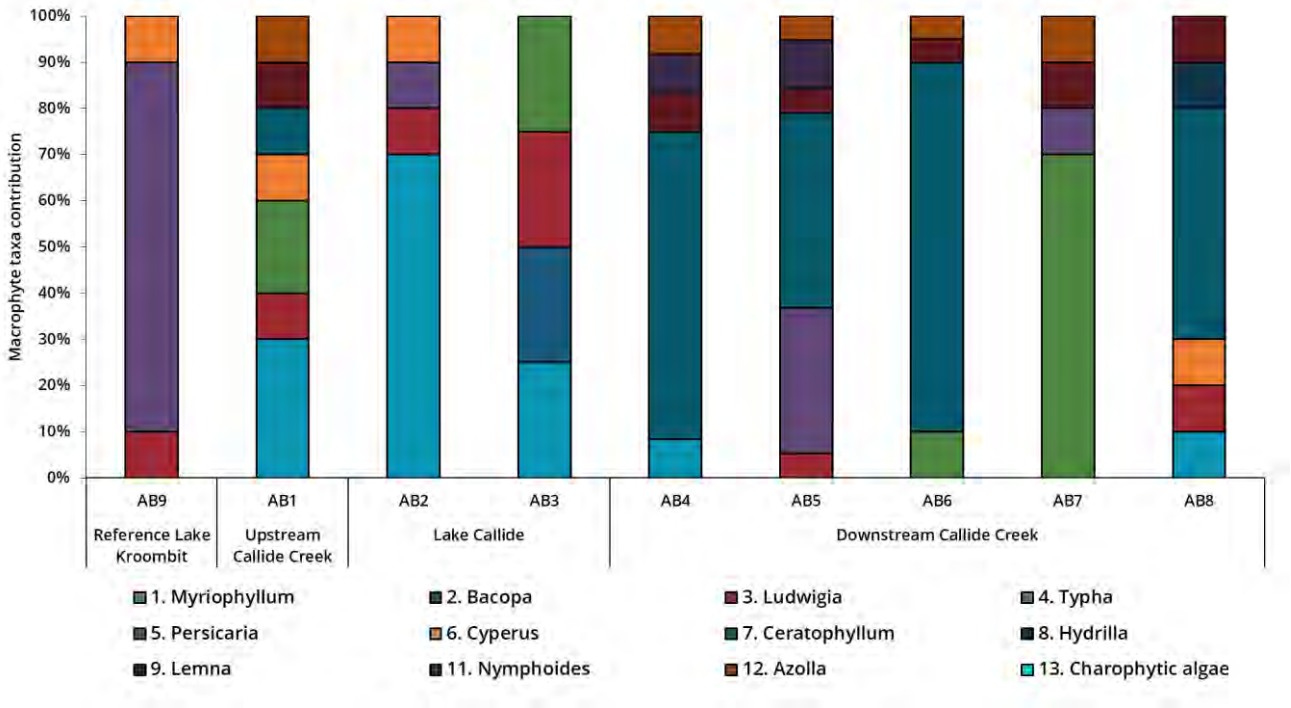

Figure 3-6 Contribution of macrophytes to overall assemblage

Table 3-1 Site descriptions and habitat assessment

Site	Feature	Upstream	Downstream
AB9	**Watercourse:** Lake Kroombit Dam **Local landuse:** Reservoir, native vegetation **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Circular pond. Banks convex shaped with slight (10-30°) side slope. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (60%) with smaller, equal coverage of cobble and boulder (20. Low compaction of bed material, poor grading, some packing and structure but little overlap and can be dislodged easily. Habitat provided by boulders/cobbles at edge. **Macrohabitat:** Entirely sandy/silty pool. **Microhabitat**: Detritus (5%), and SWD (10%) present. Macrophytes prevalent (60%) and algae present (15%), both limited to the bank edges. **Riparian vegetation:** Isolated shrubs (30%) among grasses (30%) and exotics (40%), no trees. **Habitat bioassessment score**: 51, good condition		
AB1	**Watercourse:** Upstream Callide Creek **Local landuse:** Native vegetation and roads **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped banks with steep (60-90°) left side slope and flat to low (0-30%) right side slope. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Mixture of mostly cobble and pebble (30%) with some small, equal presence of bedrock, boulder and gravel (10%). Slight, equal presence of sand and silt/clay (5%). Tightly packed, armoured – array of sizes, tightly packed, overlapping and hard to dislodge. **Macrohabitat:** Entirely rocky pool. **Microhabitat**: Some undercut banks (20%), with small, equal coverage from LWD, SWD, detritus and periphyton (10%) Macrophytes (40% total - 50% edge, 50% pool) and filamentous algae (20% total – 50% edge, 50% pool) also present. **Riparian vegetation:** Contiguous riparian vegetation. Dominant vegetation of tree form (40%), with understory of shrubs (20%) and grasses (20%). Some presence of exotics (10%). **Habitat bioassessment score**: 108, excellent condition		

Site	Feature	Upstream	Downstream
AB2	**Watercourse:** Lake Callide **Local landuse:** Reservoir, native vegetation (cleared), road, residential and farm infrastructure **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped banks slight (10-30°) side slopes. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (90%) with some areas of cobble (10%) and boulder (5%). Loose compaction of bed, loose array of particles with no packing or structure or overlap and is easily moved. **Macrohabitat:** Entirely sandy/silt pool. **Microhabitat**: Limited. Small, equal presence of small woody debris and detritus (10%) and slight presence of large woody debris (5%). Macrophytes (35%) present at edge and algae (50%) mostly present at edge (90%) with some present within the pool (10%). **Riparian vegetation:** Occasional shrubs (10%) among native (50%) and exotic grasses and pastures (30%). **Habitat bioassessment score**: 49, fair condition		
AB3	**Watercourse:** Lake Callide **Local landuse:** Native vegetation (cleared), reservoir, residential and farming infrastructure. **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped banks with low (10-30°) side slopes. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 90% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (60%), with some cobble (20%), some boulder (10%) and small, equal presence of gravel and sand particles (5%). Loose compaction of bed, loose array of particles with no packing or structure or overlap and is easily moved. **Macrohabitat:** Entirely sandy/silt pool. **Microhabitat**: Limited. Small presence of small woody debris (10%) and slight presence of detritus (5%). Macrophytes (20%) present at edge and algae (30%) mostly present at edge (90%) with some present within the pool (10%). **Riparian vegetation:** Mostly cleared habitat with occasional shrubs (10%) among native (50%) and exotic grasses and pastures (30%). **Habitat bioassessment score**: 52, good condition		

Site	Feature	Upstream	Downstream
AB4	**Watercourse:** Callide Creek, below dam spillway. **Local landuse:** Native vegetation, wetland and road/access tracks. **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped, flat (0-10°) banks. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (65%). Some cobble (20%), small presence of pebble (10%) and slight presence of boulder (5%0. Loose compaction of bed material – loose array of poorly packed or structured particles with little overlap and can be moved easily. **Macrohabitat:** Entirely sandy/silt pool **Microhabitat**: Some blanketing silt, some small, equal presence of SWD and (10%) and some slight, equal presence of LWD and periphyton (5%). Copious, equal amounts of filamentous algae and macrophytes (90%) within the pool (50%) and edge (50%). **Riparian vegetation:** Dominated by shrubs (90%) with isolated patches of native grasses (10%), essentially a wetland. **Habitat bioassessment score**: 73, good condition		
AB5	**Watercourse:** Downstream Callide Creek. **Local landuse:** Native vegetation, wetland and farm/residential infrastructure. **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped, flat (0-10°) banks. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (60%), some cobble (40%). Loose compaction of bed material – loose array of poorly packed or structured particles with little overlap and can be moved easily. **Macrohabitat:** Entirely sandy/silt pool **Microhabitat**: Abundant detritus (30%) and SWD (25%) with equal, small presence of LWD and periphyton (5%). Blanketing silt present. Copious, equal amounts of filamentous algae and macrophytes (90%) within the pool (50%) and edge (50%). **Riparian vegetation:** Isolated/scattered trees (20%) amongst native grasses (30%) and exotic pasture grasses (10%) and shrubs (40%). **Habitat bioassessment score**: 67, good condition		

Site	Feature	Upstream	Downstream
AB6	**Watercourse:** Downstream Callide Creek **Local landuse:** Native vegetation (cleared), irrigated cropping, wetland and road, and farm/residential infrastructure. **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped banks with low (10-30°) side slopes. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 90% of banks covered by vegetation or large particles. **Bed substrate:** Dominated by silt/clay (85%) with some gravel (10%) and slight presence of pebble (5%). Loose compaction of bed material – loose array of poorly packed or structured particles with little overlap and can be moved easily. Lack of habitat provide by substrate obvious. **Macrohabitat:** Entirely sandy/silt pool **Microhabitat**: Some undercut banks (10%) and detritus (15%) with equal, small presence of SWD, LWD and periphyton (5%). Abundant macrophytes (75%) mostly within pool (70%) and some edge (30%). Some algae (20%) within the pool (100%). **Riparian vegetation:** Cleared patches of trees (40%) amongst exotic pasture grasses (30%), and small, equal patches of native grasses and shrubs (15%). **Habitat bioassessment score**: 82, good condition		
AB7	**Watercourse:** Downstream Callide Creek. **Local landuse:** Wetland and native vegetation partially cleared for road infrastructure. Irrigated cropping upstream and piggery downstream. **Bed erosion and sedimentation**: Less than 5% of the bottom impact by sedimentation or scouring, no sediment deposition evident. **Banks:** Convex shaped, flat (0-10°) banks. Banks are stable, with no evidence of erosion or bank failure. Little potential for future problem. At least 80% of banks covered by vegetation or large particles. **Bed substrate:** Entirely silt/clay. Loose compaction of bed material – loose array of poorly packed or structured particles with little overlap and can be moved easily. Lack of habitat provide by substrate obvious. **Macrohabitat:** Mostly sandy/silt pool (80%) with some rocky pool (20%). **Microhabitat**: Some detritus (20%) with equal, small presence of SWD and periphyton (5%). Blanketing silt present. Small presence of macrophytes (10%) predominantly at edge (90%) and some within pool (10%). Algae present (10%) at edge (100%). **Riparian vegetation:** Cleared patches of trees (40%) amongst exotic pasture grasses (30%), and small, equal patches of native grasses shrubs and areas of bare earth (10%). **Habitat bioassessment score**: 79, good condition		

Site	Feature	Upstream	Downstream
AB8	**Watercourse:** Downstream Callide Creek/ Callide Weir **Local landuse:** Native vegetation and wetland area with grazing and farm infrastructure. **Bed erosion and sedimentation**: 5-30% of the bed affected by deposition of silt within the pool. **Banks:** Convex shaped, steep (60-80°, left) left bank and convex low (10-30°) right bank. Banks moderately stable. Infrequent, small areas of erosion (5%, right bank), 95% of the streambank surface covered by vegetation. **Bed substrate:** Dominated by pebble (60%) with some cobble (20%) and small, equal presence of gravel (10%) and silt/clay (10%). Moderate compaction of bed material – array of sizes, some packing with little overlap and can be dislodged. **Macrohabitat:** Entirely rocky pool **Microhabitat**: Presence of undercut banks (15%) and some presence of detritus (10%) with equally presence of SWD and LWD (5%). Copious amounts of filamentous algae (80%) within the pool (50%) and edge (50%). Dense and diverse assemblage of macrophytes both within the pool (50%) and edge (50%). **Riparian vegetation:** Cleared patches of trees (70% left, 30% right) amongst exotic pasture grasses (25%) and native grasses (5% left, 40% right) and shrubs (7.5%). **Habitat bioassessment score**: 97, good condition		

3.2 WATER QUALITY

In-situ physiochemical data was provided by CS Energy and is tabulated in Appendix C. Samples were collected below the surface (approximately 0.5 m depth). No water quality data was provided for site AB6. Data was compared between sites and against relevant sub-regional guideline values (DEHP, 2011) for relevant habitat types (i.e., watercourse or lake). Note that this data was provided for background/general consideration and not part of Hydrobiology's scope.

Due to absence of an existing WQO for electrical conductivity (EC) in freshwater lakes and reservoirs, EC levels were compared to the Fitzroy Basin conductivity guideline value published by Prasad et al (2012) of 2000 µS/cm. This represents a toxicity trigger for the protection of 95% of species, consistent with the moderately disturbed management classification detailed in DEHP (2011).

The following observations were made:

- The dissolved oxygen (DO) (% saturation) of all sites fell below the relevant WQO except at AB5 where no oxygen saturation data was available (Figure 3-8). The low oxygen saturation can largely be attributed to an absence of flow at all sites and abundant algal growth at the downstream Callide Creek sites;
- The EC of site AB4 was 2,631 µS/cm, exceeding the relevant WQO (Figure 3-9). It is worth noting that WQO are not indicative of toxicity, however the EC of site AB4 also exceeded the the Fitzroy Basin conductivity guideline value published by Prasad et al (2012) of 2,000 µS/cm which represents a toxicity trigger for the protection of 95% of species. All other sites remained below the Callide Creek WQO and Fitzroy Basin conductivity guideline values; and
- pH levels at all downstream Callide Creek test sites with available data were within the range of WQO values (Figure 3-7). The pH levels within the test and reference lake sites were higher than the WQO but similar to each other. The pH levels upstream of the dam at control site AB1 were also higher than the WQO and similar to levels within the Dam.

It is worth noting that data provided was collected up to seven months prior to the Hydrobiology field survey, therefore the water quality results displayed below may have differed from actual conditions during sampling.

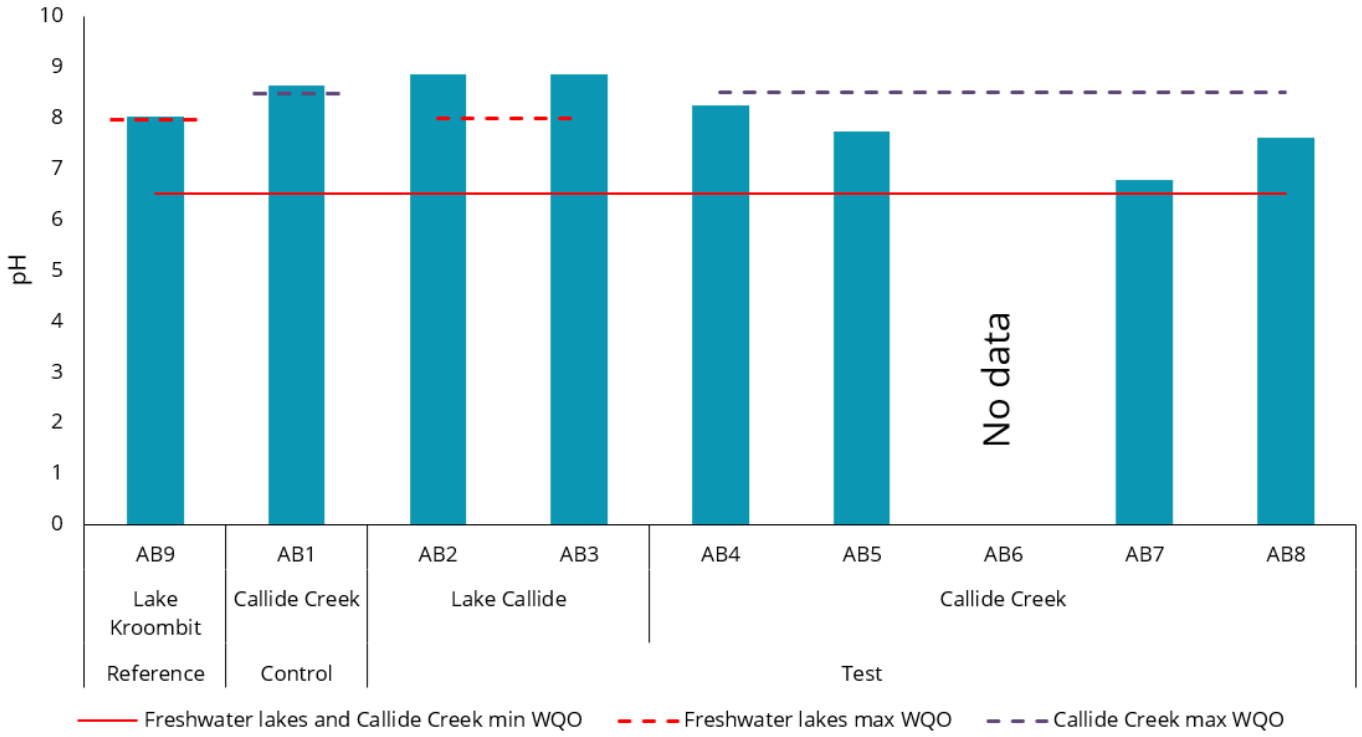

Figure 3-7 pH levels at study sites with dotted lines indicating WQO maximums and straight lines indicating WQO minimums.

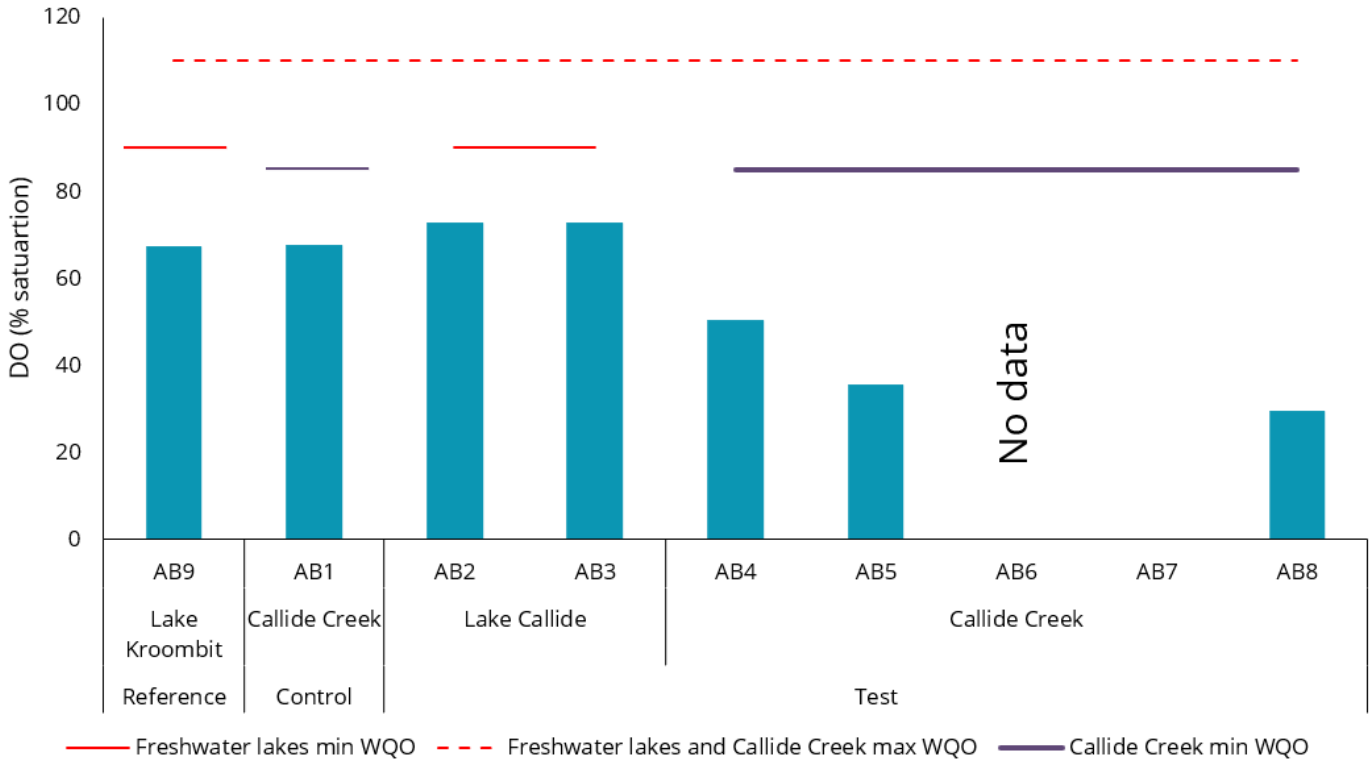

Figure 3-8 Dissolved oxygen (% saturation) levels at study sites with dotted lines indicating WQO maximums and straight lines indicating WQO minimums.

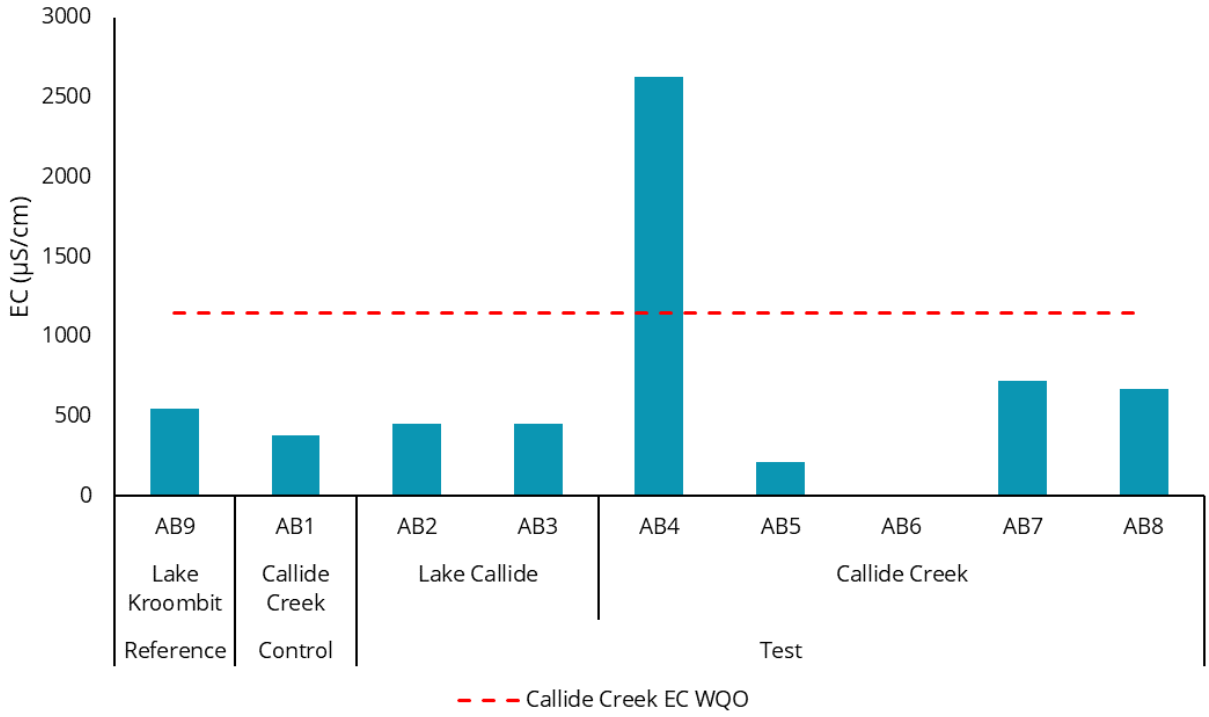

Figure 3-9 Electrical conductivity (EC, µS/cm) levels at study sites with dotted lines indicating maximum EC defined under the Callide Creek catchment WQOs. WQO only applicable for water courses, therefore not applicable to sites AB2, AB3 and AB9.

3.3 MACROINVERTEBRATES

Analysis and interpretation of diversity indices, community assemblages, AUSRIVAS modelling and functional feeding guides of all sites which contained sampleable habitat (i.e. present water) are explored below.

3.3.1 DIVERSITY INDICES

Biological quality objectives (BQOs) are defined by DEHP (2011) for Callide Creek catchment watercourses, with no BQOs defined for lacustrine habitats such as those at site AB2, AB3 and AB9. While no BQOs have been set for lacustrine habitats, sites AB2, AB3 and AB9 were included for comparison purposes.

BED

Macroinvertebrate communities were similar between habitat types (watercourse compared to lacustrine sites) and reference and non-reference sites however varied slightly between test and control sites. Overall, most sites failed to meet the defined BQO's. The following observations were made:

- No BQO has been defined for macroinvertebrate abundances. However, abundances were notably higher at reference site AB9 than any other site and there was no discernible difference between test and control sites (Figure 3-10);
- All sites fell below the BQO for taxa richness (Figure 3-11);
- Plecoptera, Ephemoptera and Trichoptera (PET) Richness BQOs were met only by control site AB1 and Lake Callide test sites AB2 and AB3. With the exception of reference site AB9, no other site recorded any PET taxa (Figure 3-12);

- Test sites AB2 and AB8 were the only sites to fall within the BQO SIGNAL2 range. Control site AB1 and test site AB4 both recorded SIGNAL2 scores that exceeded the BQO, meaning they contained higher than expected sensitive taxa. All other sites fell below the defined BQO for SIGNAL2 scores (Figure 3-13); and;
- Test sites AB2, AB3 and AB4 were the only sites to not exceed the maximum value of the BQO for % tolerant taxa BQO (Figure 3-14).

With bed habitats, test sites typically contained more tolerant taxa and few sensitive taxa in comparison to the control site. This difference is attributed to the increased substrate and habitat complexity available at AB1 in comparison to test sites downstream of Callide Dam where siltation has reduced interstitial space.

EDGE

The macroinvertebrate biodiversity indices results of control site AB1 and the Lacustrine sites AB9 (reference), AB2 (test) and AB3 (test) were similar to one another and consistently better than those recorded by test sites downstream of Callide Dam. In regard to the BQO's, the following observations were made:

- No BQO has been defined for macroinvertebrate abundances. However, abundances were notably higher at reference site AB9 than any other site and there was no discernible difference between test and control sites (Figure 3-10);
- All sites except test site AB6 fell below the BQO for taxa richness (Figure 3-11);
- PET Richness BQOs were met only by the reference site AB9 and test site AB2. All other sites fell below the BQO. PET richness, like SIGNAL2 score, is a measure of sensitive taxa present within the system, therefore it is unsurprising that the results are similar between BQOs (Figure 3-12);
- Reference site AB9 and test site AB2 were the only sites to meet the BQO for SIGNAL2 score. All other sites fell below the BQO, however sites downstream of Callide dam were consistently below other sites (Figure 3-13); and
- Control site AB1 and test sites AB2 and AB3 were the only sites to meet or fall below the % tolerant taxa BQO. All other sites exceeded the BQO for % tolerant taxa (Figure 3-14).

SUMMARY

Overall, the results would suggest that the macroinvertebrate community of downstream of lake Callide (test sites AB4 to AB8), were typically dominated by tolerant taxa when compared to the upstream control site AB1 and Lacustrine sites AB9 (reference), AB2 (test) and AB3 (test). This improved community of the control and lacustrine sites is expected to be a result of water permanence at these sites, the increased macro and microhabitat availability and reduced frequency of disturbances in comparison to the somewhat ephemeral nature of downstream Callide Creek. It is worth noting that riffles and runs were understandably absent at lacustrine sites, theoretically reducing available habitat. However, these sites contained Ephemeroptera species, which are known to inhabit lakes and reservoirs in sheltered areas such as those that were sampled.

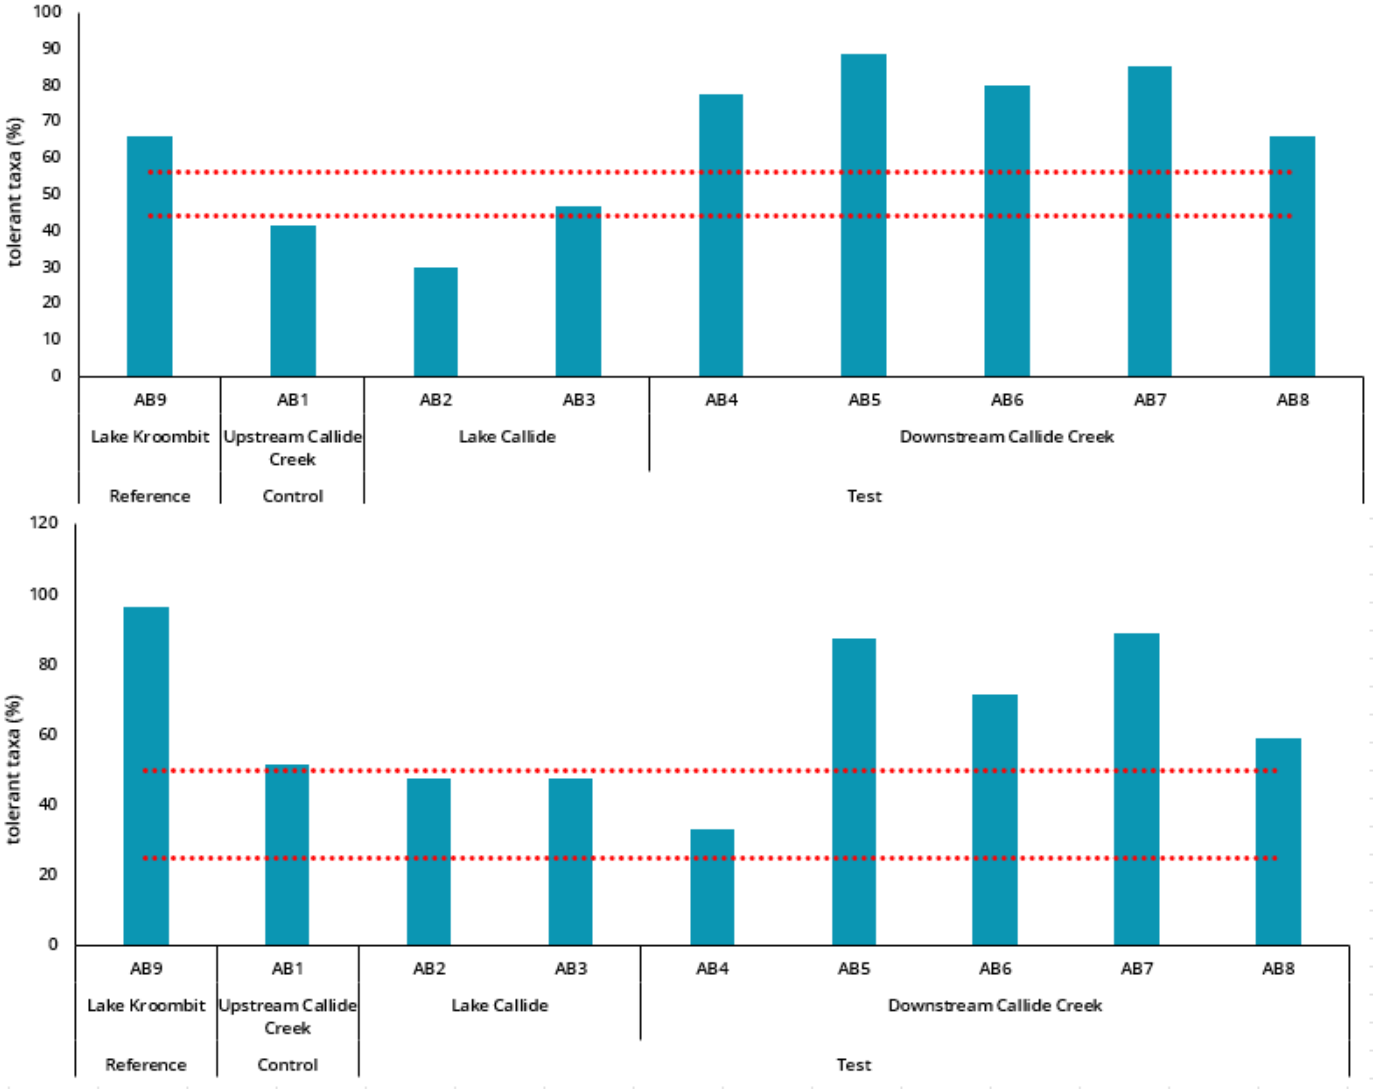

Figure 3-14 Macroinvertebrate percentage contribution of tolerant taxa at edge habitats (top) and bed habitats (bottom).

3.3.2 COMMUNITY ASSEMBLAGE

Within edge habitats, the taxa present at the greatest number of sites were Copepoda, Ostracoda, Acarina and Atyidae; however their abundances varied between test and control sites. Overall, there were no taxa that were dominant across all sites. The macroinvertebrate assemblages found within edge habitats at downstream Callide Creek sites had greater taxa evenness than the upstream Callide Creek site and the wetland sites which were dominated by one or two taxa. Cladocera were present in high numbers within the Lake Kroombit reference site but did not contribute considerably to the Lake Callide assemblages. Instead within Lake Callide site AB3, Ostracods, a different taxon of microcrustacean dominated. Another notable difference was the contribution of the family Caenidae to the Lake Callide sites AB2 (22%) and AB3 (15%) compared to their absence within Lake Kroombit. Upstream Callide Creek the family Acarina dominated the control site and was present in test site assemblages to a lesser degree. Acarina within the edge habitat of AB1 were present in high abundances due to the availability of shelter in the form of interstitial spaces as a result of reduced embeddedness, debris and macrophytes. Downstream instead contained greater abundances and a higher taxa diversity of beetles (Coleoptera) and bugs (Hemiptera). For example, as well as the families present at the control site AB1 the Coleoptera families Hydraenidae, Hydrophilidae, Hydrochidae and Hemiptera families Pleidae, Hebridae, Belostomatidae were considerable contributors to multiple test sites.

In comparison to communities found within the edge habitats, the macroinvertebrate communities within bed habitats were limited at all sites. The most widespread taxa (i.e. present at highest number of sites) within bed habitats were Copepoda and Ostracoda and these two taxa dominated most sites. Sites AB9 and AB4 showed lower diversity than other sites and were dominated by microcrustaceans (i.e. Cladocera, Copepoda and Ostracoda). Cladocera and Ostracoda species are most commonly found in sites similar to AB9 and AB4 where there is still to slow flowing waters with macrophytes and algae present. Sites AB1, AB2 and AB8 had higher taxa diversity and had greater abundances of Copepoda. Also indicative of deeper water, copepods were present in more sheltered aquatic habitats. Sites AB9 and AB3 which also had deeper pools were more exposed than sites where copepods dominated. Sites AB5, AB6, AB7 had moderate diversity and taxa evenness as copepod dominance was absent (AB5 and AB7) or reduced.

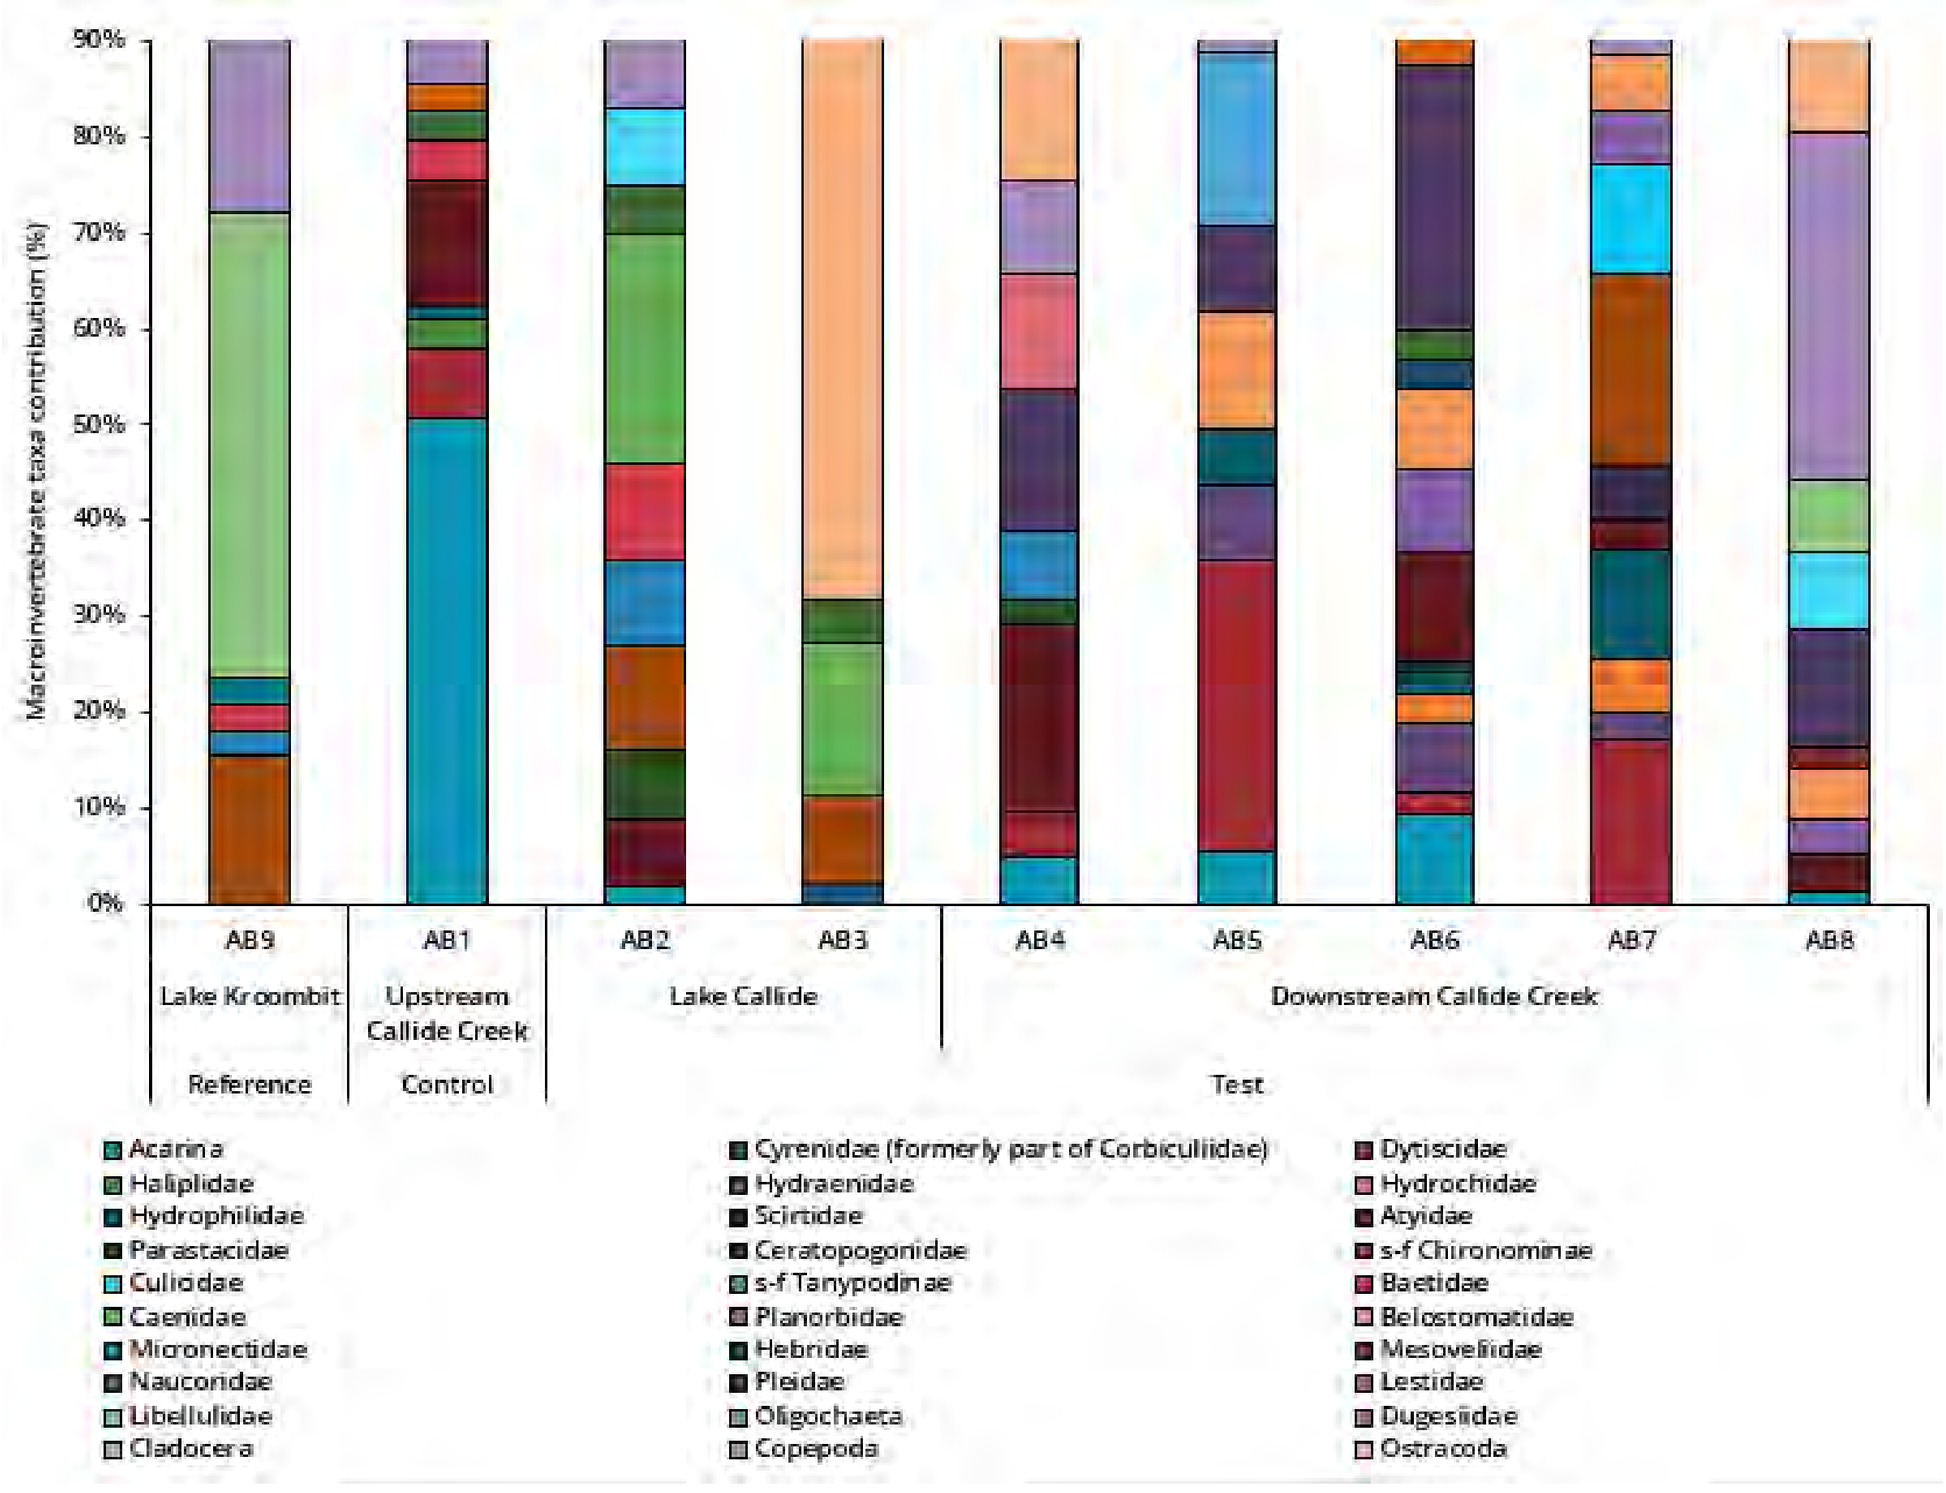

Figure 3-15 Contribution to overall macroinvertebrate assemblage from dominant taxa (dominant 90%) within edge habitat

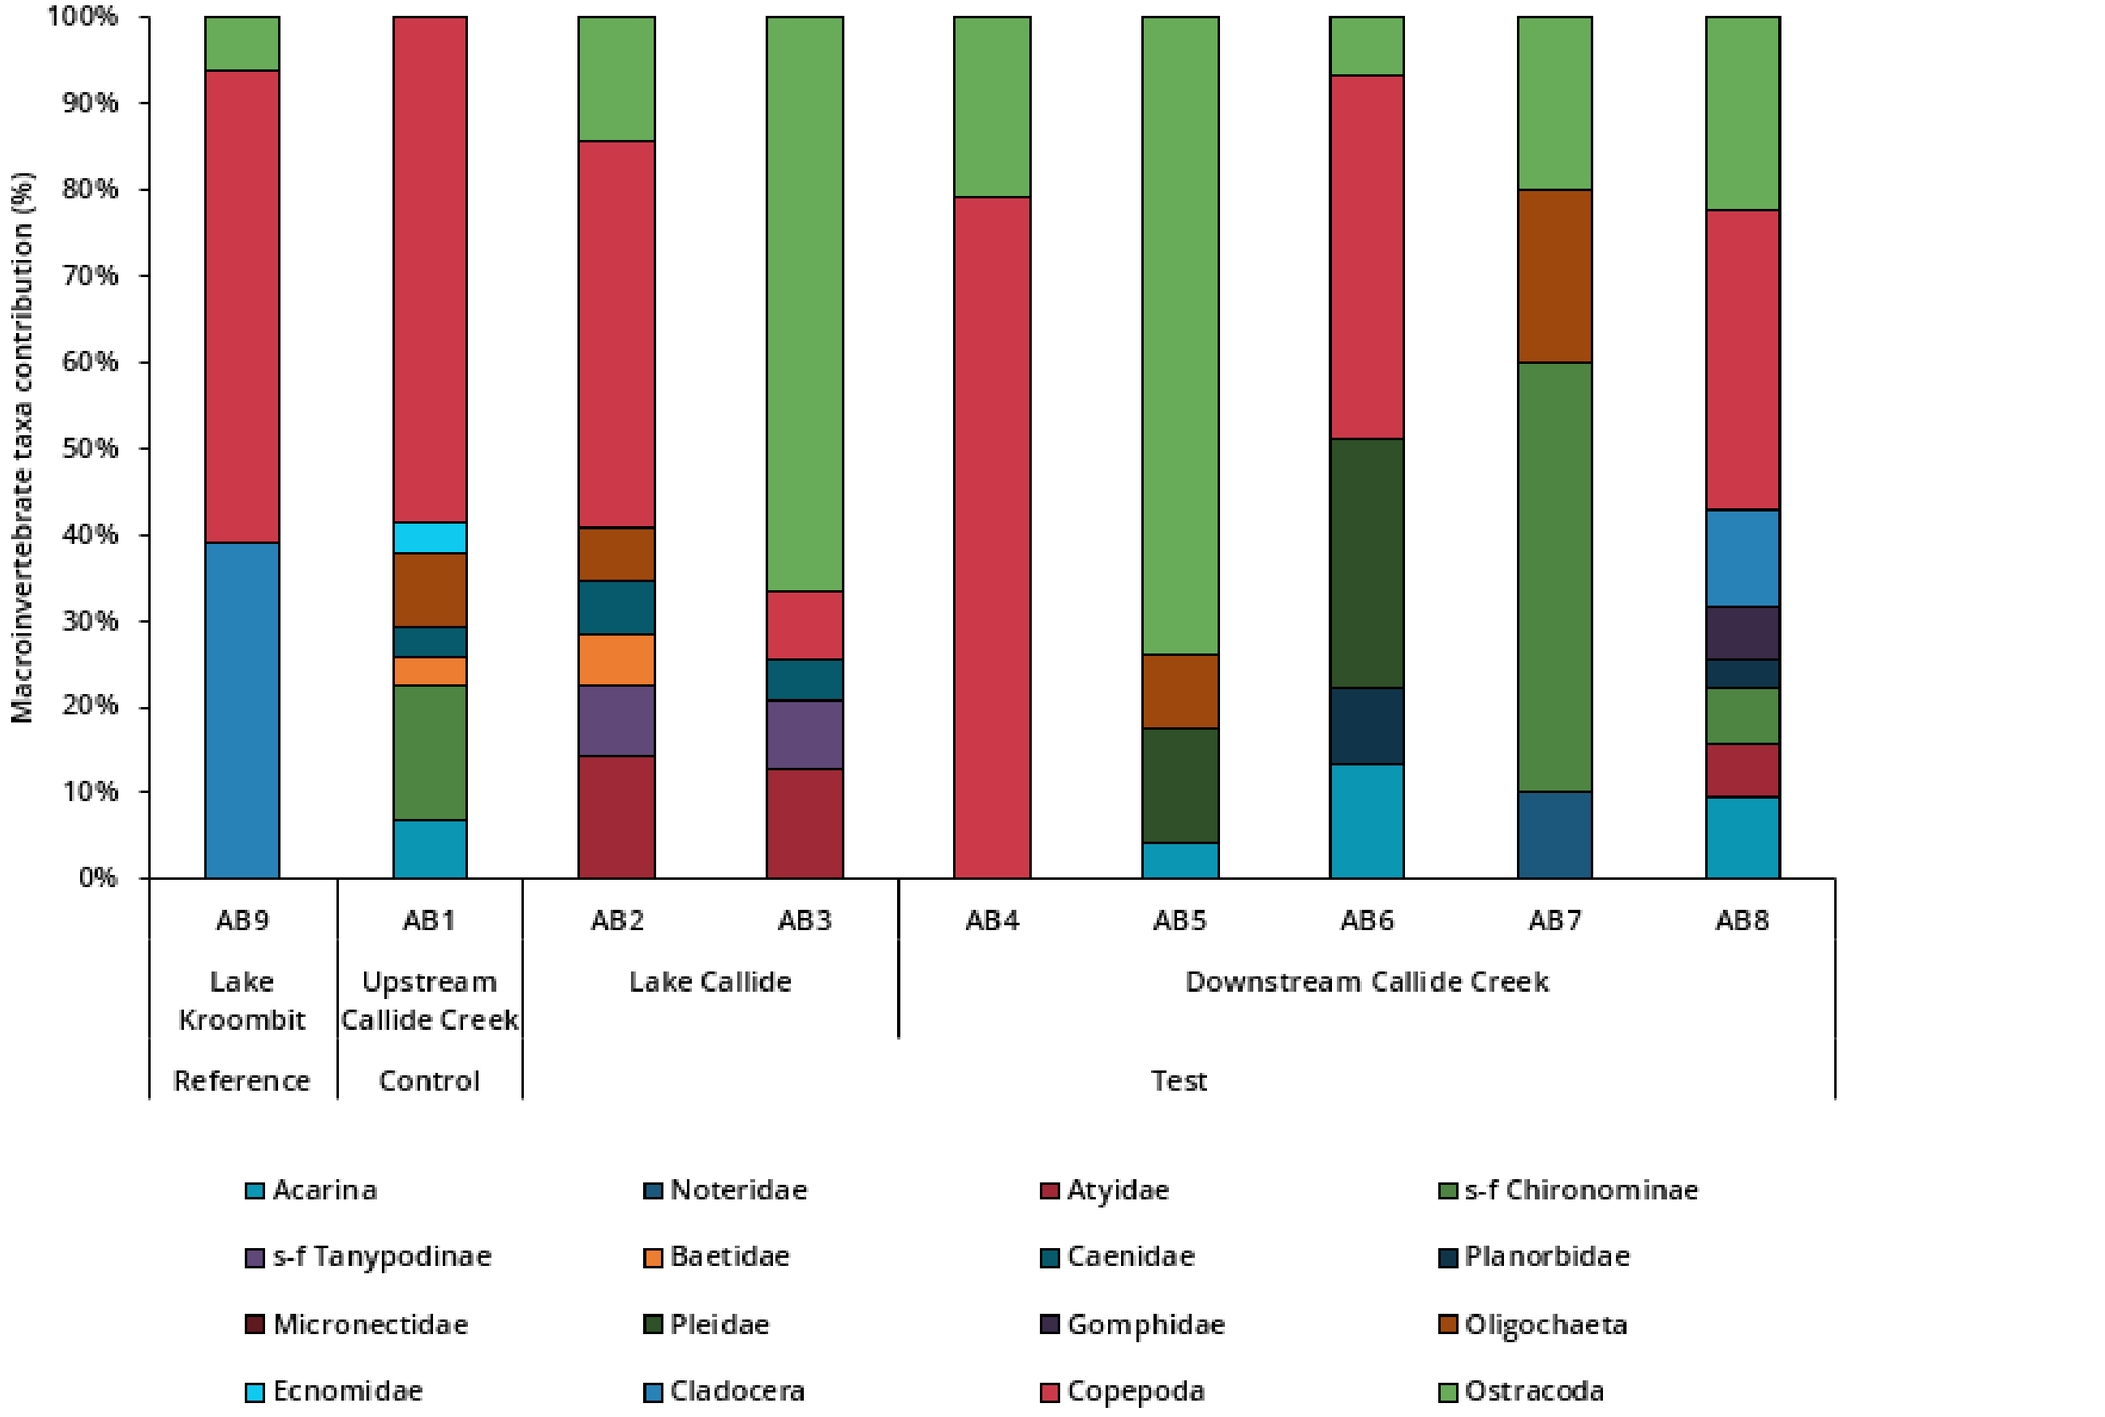

Figure 3-16 Contribution to overall macroinvertebrate assemblage from dominant taxa (dominant 90%) within bed habitat

3.3.3 FUNCTIONAL FEEDING GUIDES

Macroinvertebrate communities are often divided into functional feeding groups (FFGs) for analysis as a diverse range of taxa can be represented by a small number of FFGs which are typically indicative of food availability within a system and, more broadly, the inputs and disturbances of the system as a whole. Common divisions include filtering collectors, gathering collectors, predators, scrapers and shredders.

BED

Filtering and gathering collectors represented the majority of the macroinvertebrates present within the bed habitats of most sites. Collectors (filtering and gathering) contributed 44-90% of the total macroinvertebrate assemblage of sites, dominating at reference site AB9 and test site AB4. All other sites contained a more diverse assemblage of FFGs, with predators, scavengers, scrapers and macrophyte piercers representing small contributions to the remaining sites. There were no clear distinctions between test and control sites.

Collectors are often dominant in environments where fine particulate organic matter (FPOM) is far more abundant than coarse particulate matter, due to increased input from upstream due to biological (shredder) and mechanical processes, and autochthonous primary production. Within the surveyed sites, the macroinvertebrate assemblage within Lake Callide contained more FFG than Lake Kroombit, likely due to higher woody debris and detritus in the microhabitat of Lake Callide in comparison to periphyton.

EDGE

In comparison to bed habitats, the FFGs present within the edge habitat were more diverse and there were some notable variations in FFGs between sites, however no clear distinction between treatments.

Within edge habitats, sites were largely dominated by predators, however collectors were also present as were scrapers, shredders and parasites. Predators and parasites represented at least 50% of the macroinvertebrate assemblage present within the edge habitats of all sites except AB8, with the remaining macroinvertebrates typically collectors. The edge community at site AB8 had higher levels of filtering collectors, namely copepods. Predators are a highly diverse FFG, and typically represent a stable contribution to the macroinvertebrate taxa, however overabundance can be indicative of disturbed systems.

Predators typically represent a stable contribution to the macroinvertebrate taxa but are usually classified as over-abundant when the predator: prey ratio exceeds 0.2, and usually represent <45% of the overall assemblage(Kaboré et al., 2016; Masese et al., 2014; Rai et al., 2019; Sitati et al., 2021). Some suggested reasons for domination by predator taxa have included prey communities able to support large predator abundances (short life history traits) and seasonality of prey availability within the overall community; however high predator abundances are often linked to disturbances, poor water quality and surrounding land use(Carrasco-Badajoz et al., 2022; Edegbene & Akamagwuna, 2022; Miserendino & Masi, 2010; Rai et al., 2019; Sitati et al., 2021). The dominance of predators within the edge habitats of most sites would suggest that these sites are highly disturbed with poor water and/or habitat quality, which is consistent with the noted lower than expected diversity and abundance of tolerant taxa, particularly downstream of Lake Callide.

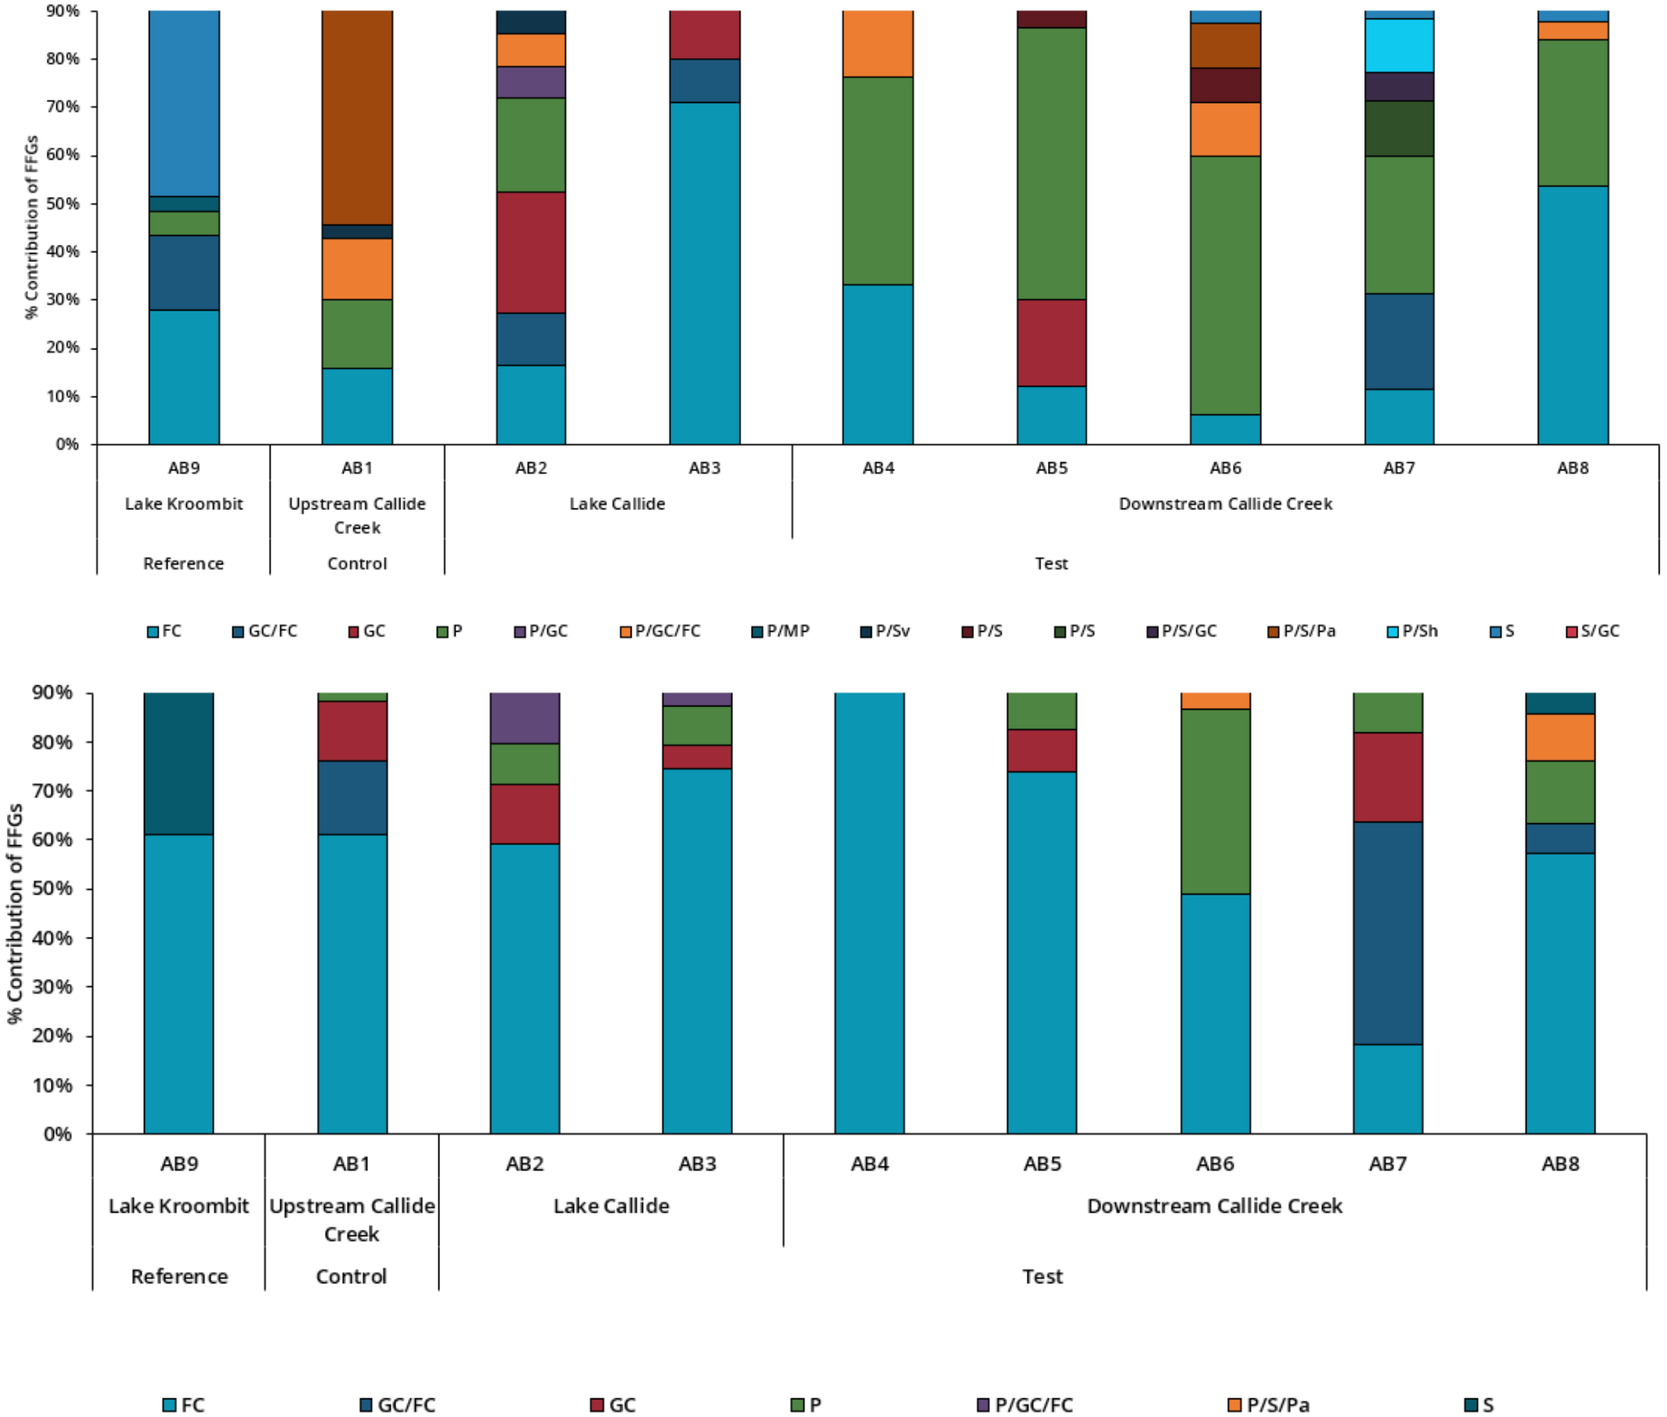

Figure 3-17 Functional Feeding Guides (FFGs) of macroinvertebrate taxa (high contributing species -90%) within edge (top) and bed (bottom) habitats. FFGS present in the study included filtering collectors (FC), gathering/filtering collectors (GC/FC), gathering collectors (GC), predators (P), predators/gat5hering collectors (P/GC), predators/gathering collectors/filtering collectors (P/GC/FC), predators/macrophyte piercers (P/MP), predators/scavengers (P/Sv), predators/ scrapers (P/S), predators/scrapers/gathering collectors (P/S/GC), predators/scrapers/parasites (P/S/PA), predators/shredders (P/Sh), scrapers (S), scrapers/gathering collectors (S/GC).

3.3.4 AUSRIVAS MODELLING

Within edge habitats all sites were in significantly impaired condition including the control site. Within bed habitats the control site recorded better than reference condition and site AB8 the furthest downstream recorded reference condition bed habitat. Sites more directly downstream of Lake Callide such as AB4, AB6, and AB7 all had significantly impaired bed habitat and downstream site AB5 had severely impaired bed habitat. As mentioned previously, the habitat condition of site AB1 was superior to the condition of the downstream Callide Creek sites due to higher variability in the substrate and microhabitat.

Table 3-2 OE50 scores from the March 2023 data. Bands are indicated in brackets and by cell colour; dark green (X) = more biologically diverse than reference site; light green (A) = reference condition; yellow (B) = significantly impaired; orange (C) = severely impaired; red (D) = extremely impaired.

Site	OE50 Edge scores	OE50 Bed Scores
Control – Upstream Callide Creek		
AB1	0.72(B)	0.96(X)
Test – Downstream Callide Creek(B)		
AB4	0.88(B)	1.06(B)
AB5	0.85(B)	0.78(C)
AB6	0.83(B)	0.97(B)
AB7	0.72(B)	0.77(B)
AB8	0.86(B)	0.9(A)

3.4 FISH, MACROCRUSTACEANS, AND REPTILES

Diversity, community assemblages and recruitment and biomass of all aquatic species caught at sites during the survey event are explored below.

3.4.1 FISH

WQO COMPARISSON

Ratio of Observed to Expected native species (O/E50) and exotic fish species WQO values were defined by DEHP (2011) for sites along the main trunk of Callide Creek only. This meant that data from site AB9 could not be used as it was located in a different catchment (Kroombit Creek). Overall, control sites scored better than test sites, but sites were typically less diverse than expected.

Control site AB1 was the only site along the main trunk of Callide Creek that met the WQO for O/E50 values (Table 3-3). All test sites fell below the O/E50, meaning that they contained fewer native taxa that would be expected in. All sites except control site AB1 and test site AB3 contained *Gambusia holbrooki*. The species has been recorded within Callide Creek main trunk before and is listed within the defined WQO. However, as no site recorded non-native species not listed within the WQOs or more than two non-native species, all sites met the WQO for alien taxa.

Table 3-3 Comparison of Callide Creek main trunk fish WQOs to observed fish diversity indices of each assessed reach. Highlighted values indicate non-conformance with the defined biological WQO.

Site	Treatment	O/E50	Alien Taxa
AB1	Control	1	0
AB2	Test	0.7857	1
AB3	Test	0.5714	0
AB4	Test	0.5714	1
AB5	Test	0.2143	1
AB6	Test	0	1
AB7	Test	0.3571	1
AB8	Test	0.8571	1

DIVERSITY

Across the study area a total of 3,863 individuals representing 19 taxa were recorded in varying abundances across sites (Figure 3-18; Table 3-4). Species recorded in higher abundances included bony bream (*Nematalosa erebi,* n=1032), fly-specked hardyhead (*Craterocephalus stercusmuscarum,* n=955), Agassizii's glassfish (*Ambassis agassizii,* n= 513), and barred grunter (*Amniataba percoides,* n = 501). Agassizii's glassfish was additionally the most abundant species occurring at all but one site (AB6). Other widespread taxa included fly-speckled hardyhead (n=6), mosquitofish (*Gambusia holbrooki*, n= 6), and carp gudgeon (*Hypseleotris sp.,* n=6). Conversely, the larger-bodied southern saratoga was only represented by one individual recorded in the deepest waterbody; Lake Callide site AB2.

AB1 (14 taxa) had the highest taxa richness across the surveyed sites followed by downstream Callide Creek site AB8 (13 taxa). Downstream of Lake Callide sites AB5, AB6 and AB7 had the lowest taxa richness and fish abundance. Taxa that prevailed at these less diverse sites included Agassizi's glassfish, mosquitofish (*Gambusia holbrooki*), and southern purplespotted gudgeon (*Mogurnda adspersa*). Sites AB5, AB6 and AB7 consisted of small, shallow pools dense with macrophytes and therefore there was limited available macrohabitat and food sources available for a wider range of species. In Callide Creek taxa exclusively recorded in the upstream site AB1 and the downstream site AB8 included golden perch (*Macquira ambigua),* barred grunter (*Amniataba percoides),* spangled perch (*Leiopotherapon unicolor),* bony bream *(Nematalosa erebi),* Hyrtl's catfish *(Neosilurus hyrtlii)* and freshwater longtom *(Strongylura krefftii).* The presence of these species is likely attributed to more diverse macrohabitats and microhabitats. These larger bodied taxa, most of which are carnivores or omnivores need larger areas and greater access to suitable food sources to meet their reproductive and survival needs. Therefore AB1 and AB8 as larger, more connected, more diverse aquatic habitats are more likely to support these species.

Fish abundance was greatest within Lake Callide at site AB3 (n=1515), followed by AB2 (n=1010) and greatly exceeded the reference site AB9 at Lake Kroombit (n=202). The smaller Lake Kroombit was less diverse than the test sites in Lake Callide as only six taxa were recorded at AB9 whereas in

comparison 13 taxa were recorded across sites AB2 and AB3. Taxa recorded in both lakes included Agassizii's glassfish, carp gudgeon, Hyrtl's catfish and freshwater catfish (*Tandanus tandanus*). Species absent from the test sites that were present in the reference included spangled perch (*Leiopotherapon unicolor*) and eastern rainbowfish (*Melanotaenia splendida*). Overall, the larger Lake Callide supported more individuals and taxa as predicted.

EXOTIC SPECIES

Sites AB5 and AB6 were dominated by the exotic species mosquitofish (*Gambusia holbrooki,* n=107) which were also present at sites AB2, AB4, AB7 and AB8. Mosquitofish were present in low numbers (n=2) in Lake Callide and were not recorded in Lake Kroombit nor upstream at site AB1.

COMMUNITY ASSEMBLAGES

Typically, downstream creek site assemblages were dominated by small-bodied fish with site AB8 additionally supporting medium bodied species such as spangled perch (*Leiopotherapon unicolor*) and bony bream. Whereas upstream at Callide Creek site AB1 there was more diverse assemblage of fish and higher abundances of medium bodied fish such as bony bream and spangled perch. Within Lake Callide larger individuals such as southern saratoga (*Scleropages leichardti*) that require bigger and deeper bodies of water are a part of the system.

Species stocked by the Callide Valley Native Fish Stocking Association (CVNFSA) within Lake Callide include golden perch (*Macquaria ambigua*), barrumundi (*Lates calcarifer*), southern saratoga (*Scleropages leichardti*) and sleepy cod (*Oxyeleotris lineolata*) of which the three latter species were recorded at Lake Callide and downstream in the case of sleepy cod, in low abundances and likely represent translocated populations. One golden perch was recorded upstream of the dam wall at site AB1.

RECRUITMENT AND BIOMASS OF FISH

Variation in fish length suggests the presence of several different age/size classes (fingerlings, juveniles and adults) at all sites excluding AB6 where no fish were recorded (Table 3-5). Species recorded in low abundances such as *Strongylura kreffti* (freshwater longtom), golden perch and southern saratoga do not demonstrate this pattern and their sizes indicate adult individuals. These individuals may then only be present in the environment through stocking and associated dispersal and not from local populations within Lake Callide and Callide Creek. For most of the taxa present within site assemblage variation in size classes suggests successive generations and that both sites are providing suitable nesting habitat as all the species identified are potadromous (i.e. their lifecycle is completed in freshwater). The invasive mosquitofish individuals were mostly small indicating they are the result of successive generations where there a few reproductively active individuals producing many offspring that are heavily predated and/or resource limited due to their population density, leading to mortality before they reach full maturity.

The sites downstream of Callide Dam, excluding AB8 the furthest from Lake Callide, were populated by relatively small fish, indicating that present habitat may not be sufficient to support larger fish species. However, these sites may still serve as nursery habitats for fish before they move into areas with deeper pools like those provided at site A8 to mature. The availability of suitable nesting and spawning habitat within these more degraded reaches is likely a factor that limited the presence of juveniles of other species.

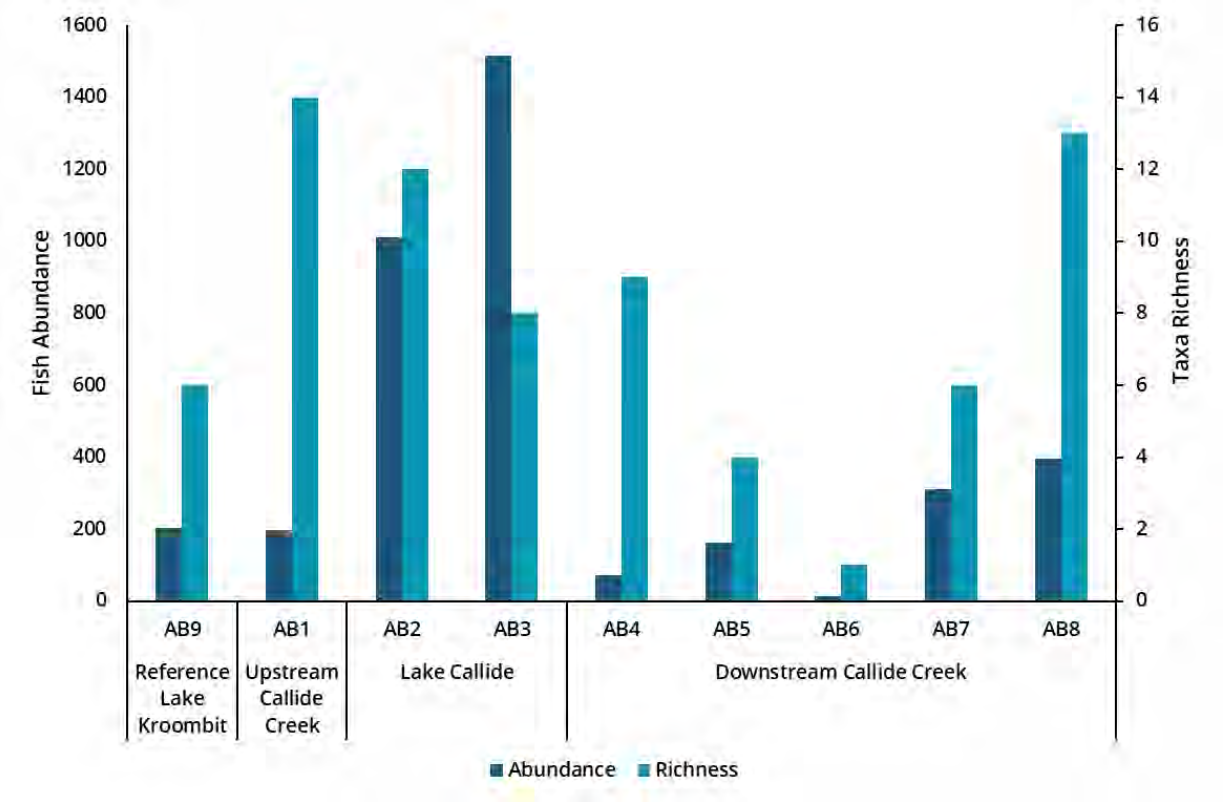

Figure 3-18 Abundance and taxa richness of fish caught at all sites.

3.4.2 MACROCRUSTACEANS

Across the surveyed sites, a total of three macrocrustacean taxa were recorded with assemblages notably different upstream and downstream of Callide Dam (Figure 3-19, Table 3-6). Only freshwater shrimp (*Atyidae sp*.) were recorded downstream of Callide Dam and only at sites AB4 (n=5) and AB7 (n=20). No macrocrustaceans were recorded at AB5, AB6 and AB8 likely a result of the reduced available habitat. Upstream of the Callide Dam spillway, where more water and habitat was available at sites AB3, AB2 and AB1 macrocrustacean taxa richness was higher as two taxa were present: redclaw crayfish (*Cherax quadricarinatus*); and freshwater prawns (*Macrobrachium sp*.). Abundance of these two taxa was highest at site AB3 (n=43) followed by similarly abundant sites AB1(n=15) and AB2 (n=14). At the reference site AB9, a smaller lake than Lake Callide macrocrustacean abundance was lower (n = 9) and only freshwater prawn was recorded.

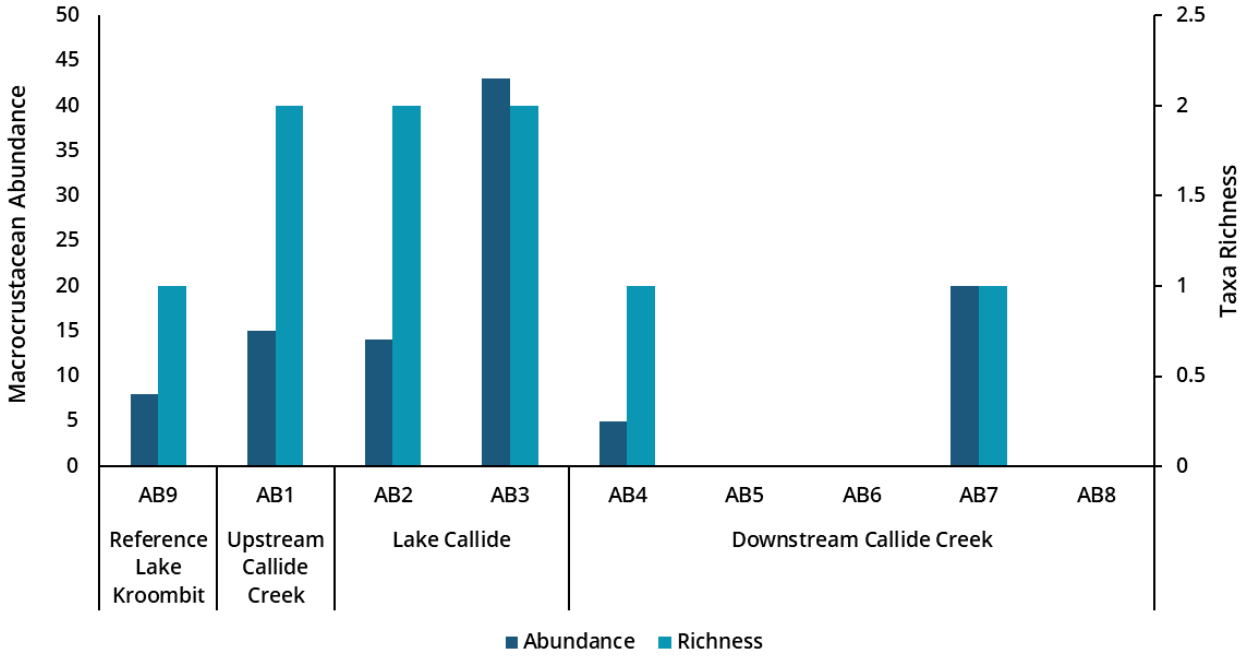

Figure 3-19 Abundance and taxa richness of macrocrustaceans caught at all sites - no macrocrustaceans were captured or observed at AB5, AB6 or AB8.

Table 3-6 Macrocrustaceans captured in March 2023 survey.

Taxa	common name	Reference	Upstream Callide Creek	Lake Callide		Downstream Callide Creek

Macrobrachium	freshwater prawn	8	11	2	20					
Total		8	15	14	43	5			20	

3.4.3 REPTILES

Krefft's turtle (*Emydura krefftii*) was present at all sites except for AB7 and abundant at sites AB9 (n=49), AB1 (n-40) and AB8 (n=45). The remaining four species were present at low abundances, each present across a few sites. Control site AB1 which had greater availability of microhabitats and better water quality, had the highest taxa richness with all five species recorded. Single broad-shelled river turtles were present at sites AB1, AB7 and AB8. Sawshell turtles were also recorded in low abundances at sites AB9 (n=3), AB1 (n=1) and AB8 (n=1). Eastern long-necked turtles were recorded at AB1 (n=1) and AB3 (n=2). The critically endangered White throated snapping turtle was only recorded at the most diverse site AB1 (n=1). The dissolved oxygen at this site was significantly higher than recorded at the downstream sites and more conducive to turtle physiology (i.e. cloacal breathing). Habitats downstream are also likely limited in the number of turtles they can support due to the size of the waterbodies and the abundance of microhabitats and food. The infrastructure of the Dam may create barriers to dispersal of turtles, especially when population numbers are low, as in the case of the white-throated snapping turtle.

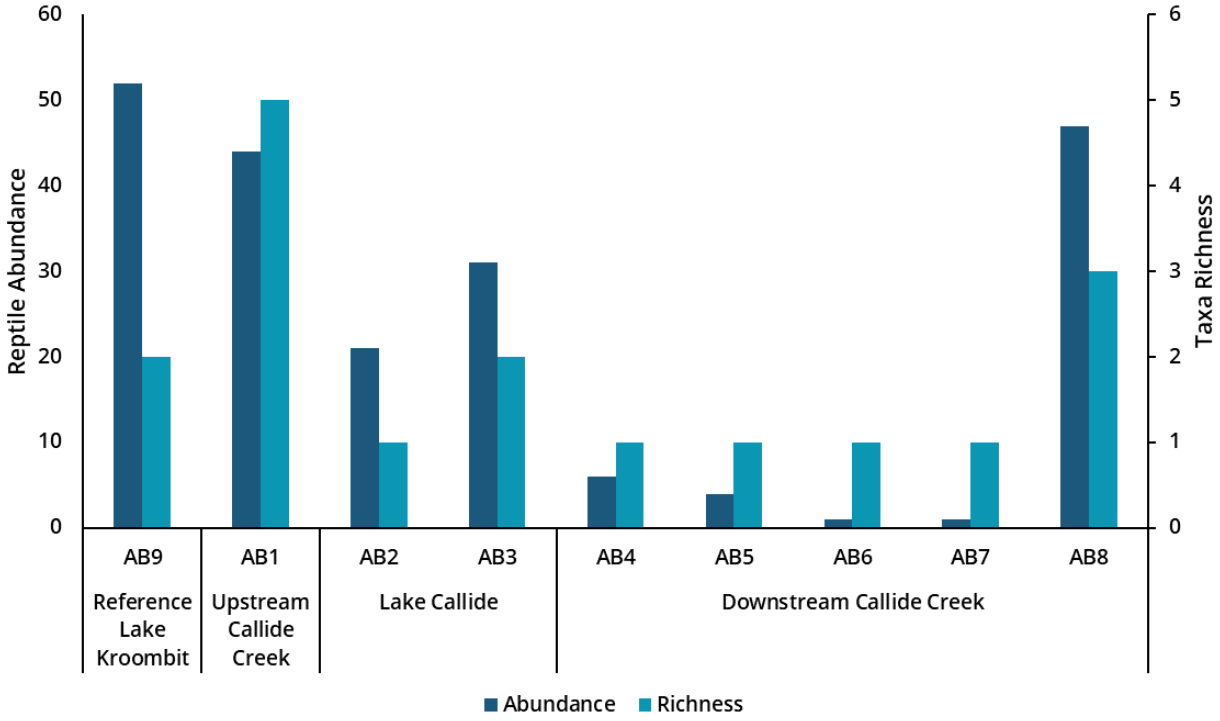

Figure 3-20 Abundance and taxa richness of reptiles caught at all sites - no reptiles were captured or observed at AB14.

3.5 BIOTA TISSUE ANALYSIS

3.5.1 PFAS

The target human and ecological health species were chosen based on the Sampling Analysis and Quality Plan (SAQP) (Epic Environmental, 2022). The human and ecological health target biota caught and subsequently analysed are displayed in Table 3-8.

HUMAN HEALTH TARGET SPECIES

To inform the human health risk assessment, the target samples were edible size biota that are more commonly consumed by local residents. This provides the most representative dataset regarding risk to human health via consumption of fish.

The target freshwater species for human health assessment as designated in the SAQP (Epic Environmental, 2022) were:

- Barramundi (Lates calcarifer);
- Crayfish (*Cherax quadricarinatus*); and
- Yellowbelly (*Macquaria ambigua*).

As the target species were not well represented at all sites within in the catchment it was decided that additional human health target species should be selected. These species were those potentially eaten by humans and were selected based on local knowledge and those defined as common edible freshwater species for PFAS sampling programs (Queensland Health, no date). The additional species were:

- Eeltail catfish (*Tandanus tandanus*);
- Hyrtl's catfish (*Neosilurius hyrtlii*);
- Rendahl's catfish (*Porochilus rendahli*); and
- Sleepy cod (*Oxyeleotris lineolata*).

The results were compared against human health screening criteria (see Table 5-2 in Appendix A).

ECOLOGICAL HEALTH TARGET SPECIES

Target species for the ecological risk assessment vary from the human health risk assessment and largely represent lower trophic organisms that are predated by higher order species.

The target freshwater species for ecological health assessment as designated in the SAQP were:

- Eeltail catfish (*Tandanus tandanus*)
- Eastern rainbowfish (*Melanotaenia splendida*)
- Fresh water mussels (*Velesunio sp.)*
- Spangled perch (*Leiopotherapon unicolour*)
- Freshwater prawn (*Macrobrachium sp.*)

As only freshwater prawns were well represented in the catchment the following additional target species were selected:

- Agassiz's perchlet (Ambassis agassizii);
- Fly-specked hardyhead (Craterocephalus stercusmuscarum); and
- Freshwater shrimp (Atyidae).

Table 3-8 Human and ecological health species caught and selected for analysis.

Common name	Species	Reference	Control	Test

RESULTS

Results are presented below for detectable concentrations of PFAS, metal/metalloids and fluoride. Collected data has been tabulated in Appendix E and the relevant laboratory reports are provided in Appendix F.

The results of the human health target species were compared against human health screening criteria values (see Table 5-2 in Appendix A). The results of the ecological health target species were compared against ecological screening criteria values (see Table 5-3 in Appendix A).

Human Health Target Species

No PFOA (Perfluorooctanoic Acid) was detected in any sample, however PFOS[1] (Perfluorooctanesulfonic acid) were detected in five of the six human health targets and values were above guideline levels for each sample tested apart from *O. lineolata* (Figure 3-21). PFOS was detected at both the control site and test sites on Callide Creek and results indicated an increase in PFOS at sites furthest downstream, with the highest values recorded in *N. hyrtlii* at site AB8. The concentration of PFOS within the edible portion on *M. ambigua* was broadly similar to the rest of the body.

No PFOS was detected in biota tissue from either the reference site on Kroombit Lake or the test sites on Lake Callide. It should be noted that PFOS was not detected in barramundi (caught in Lake Callide at sites AB2 and AB3), a species highly likely to be targeted and consumed by humans.

1 PFOS represents PFHxS + PFOS

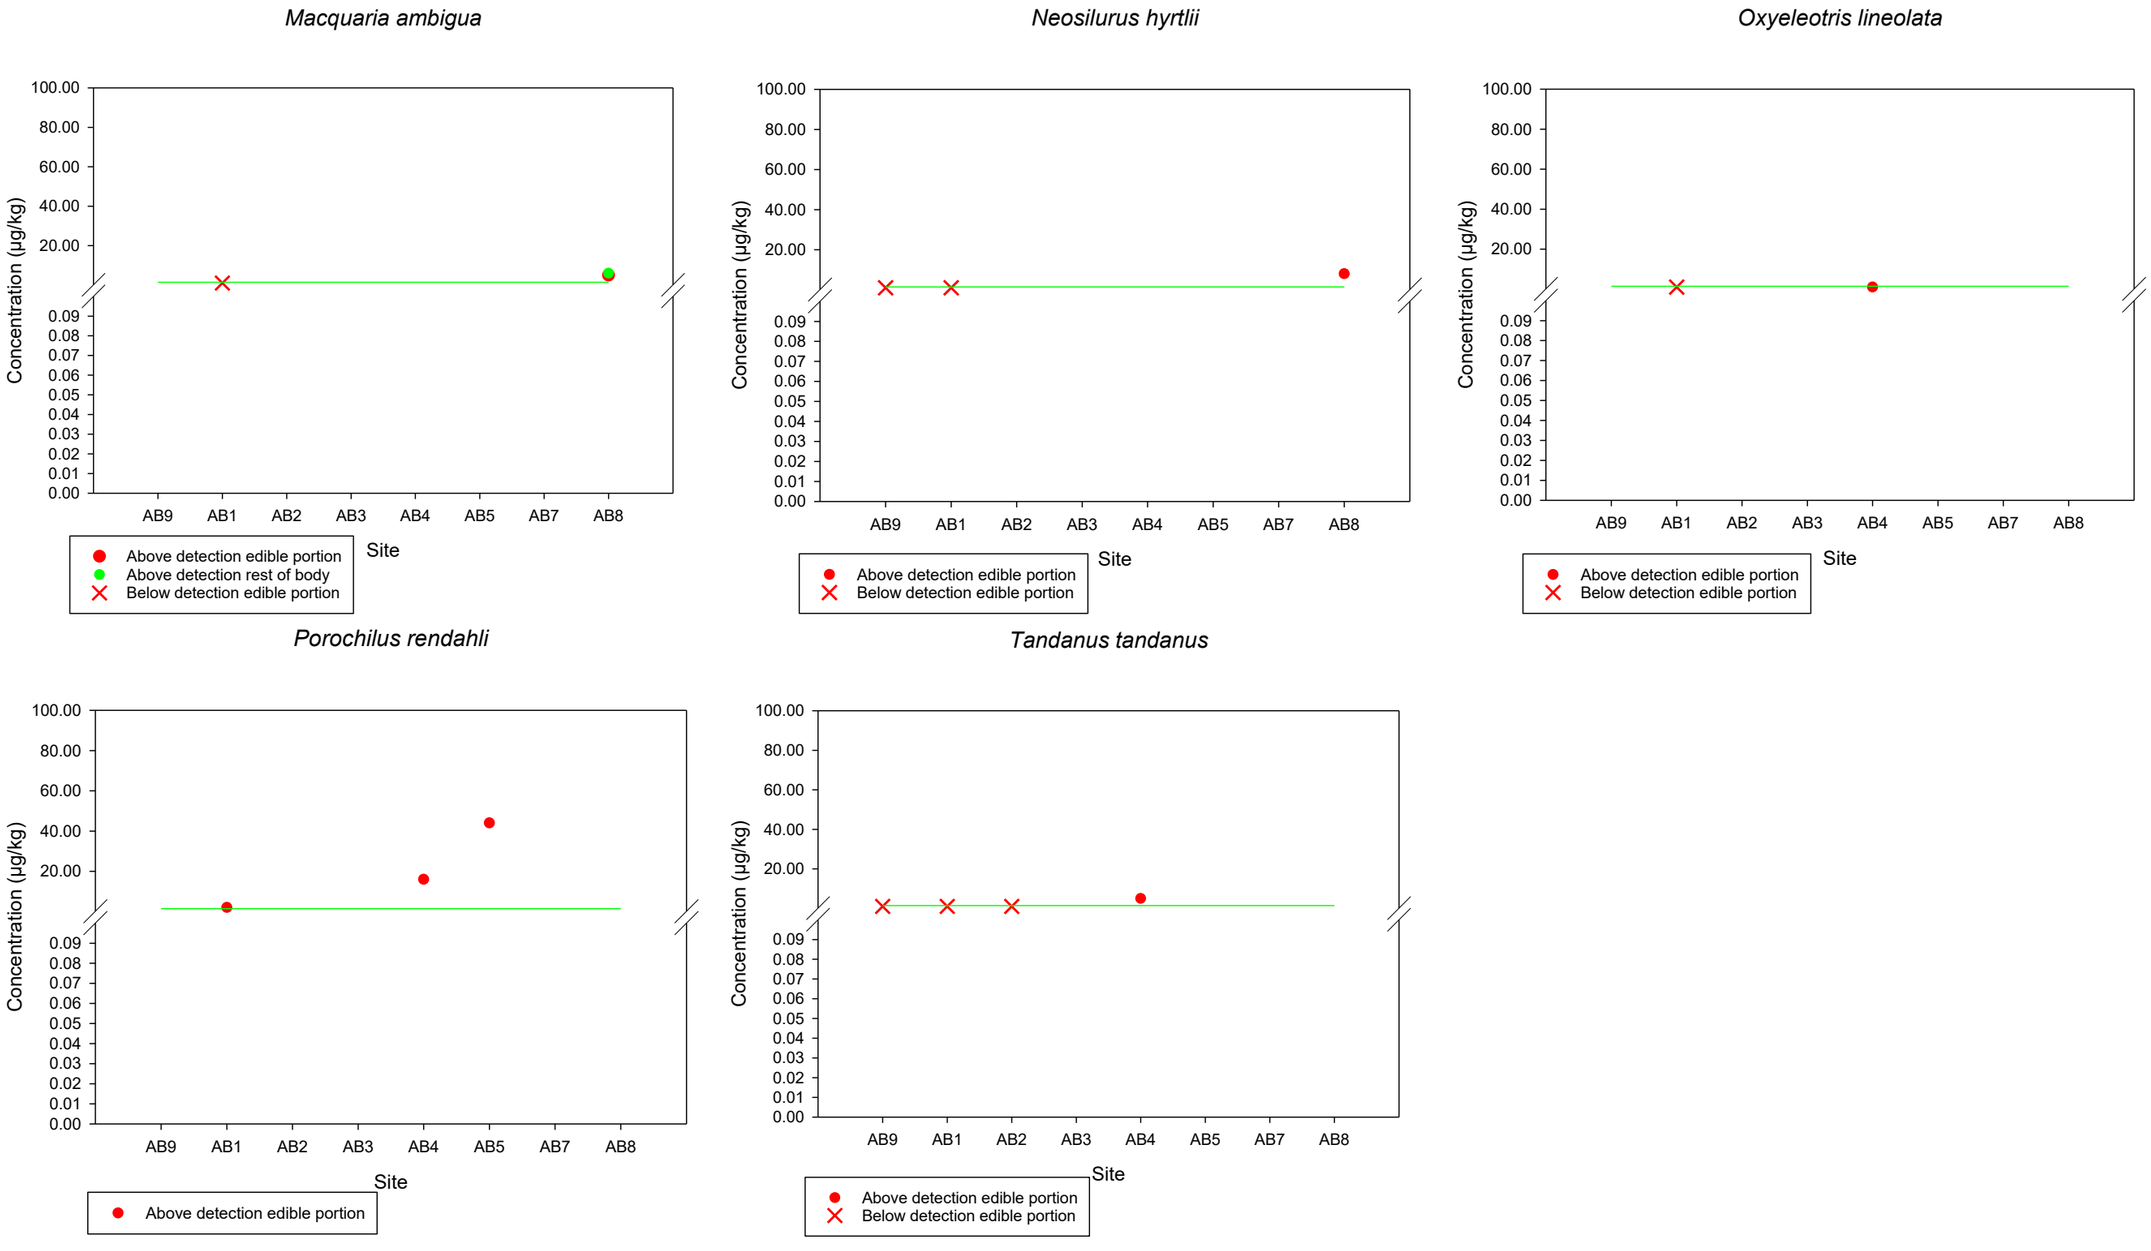

Figure 3-21 PFOS measured from human health target species. Green line represents human health guideline value (NEPM, 2020).

Ecological Health Target Species

PFOS detections were limited to test sites on Callide Creek, with all values except one (Atyidae, AB4) being above both the avian and mammalian diet guideline levels (NEMP, 2020) (Figure 3-22). PFOS concentration showed an increase at sites further downstream, with the highest values recorded in *A. agassizii* at AB8.

There were no detections of PFOS at the reference site on Kroombit Lake, the control site on Callide Creek or at test sites on

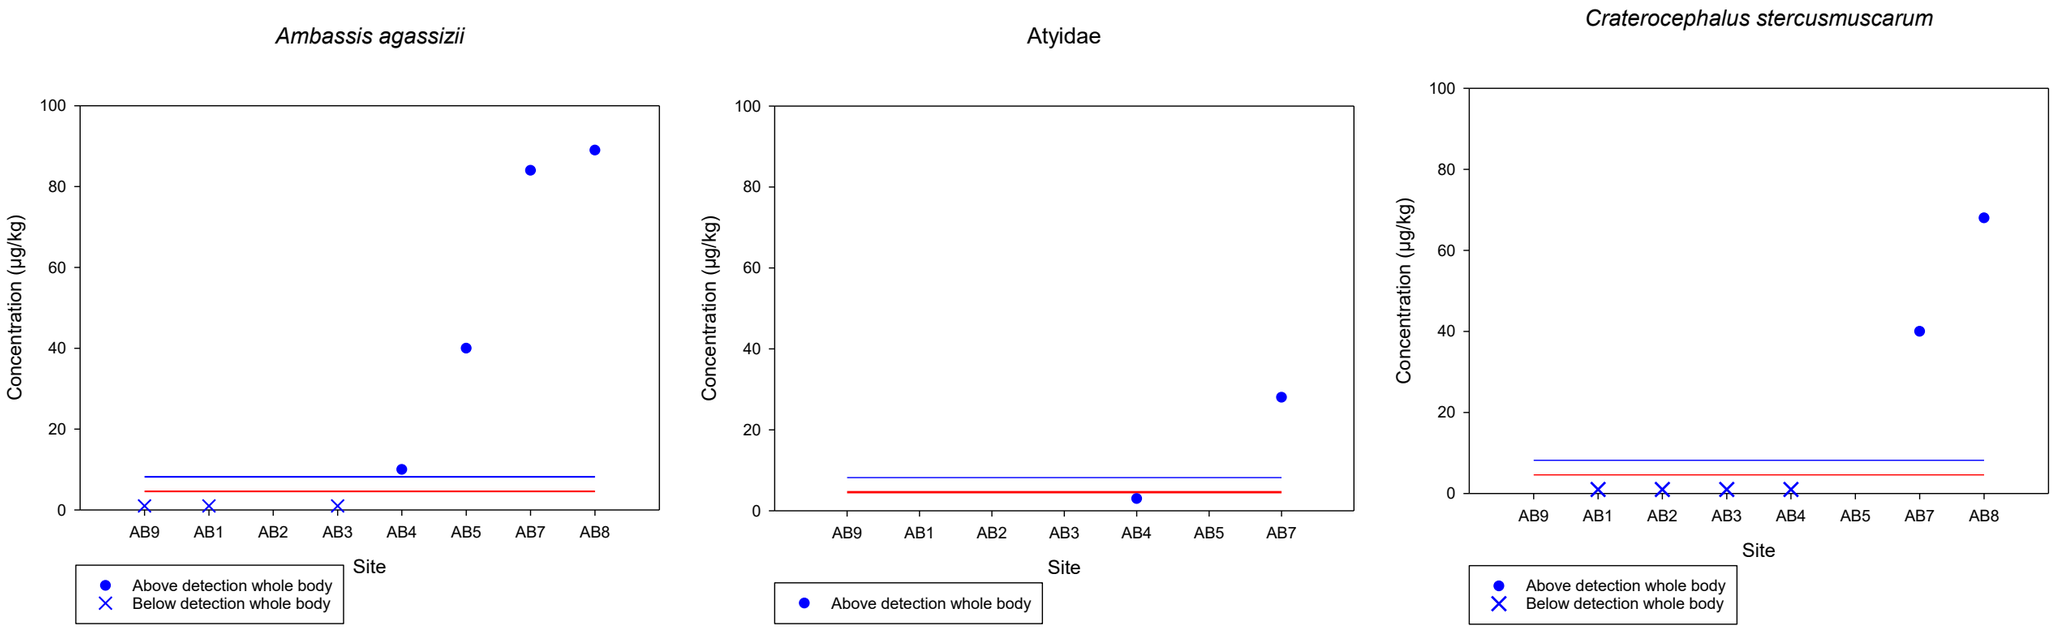

Figure 3-22 PFOS measured from ecological health target species. Lines represents avian (blue) and mammalian (red) diet ecological guideline values (NEMP, 2020).

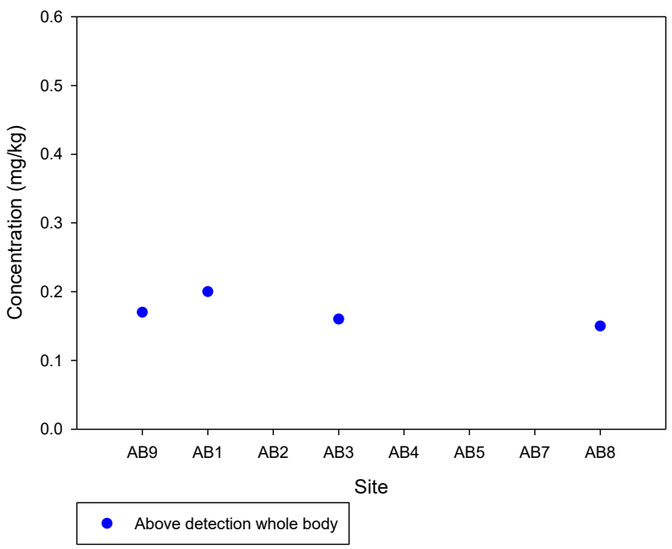
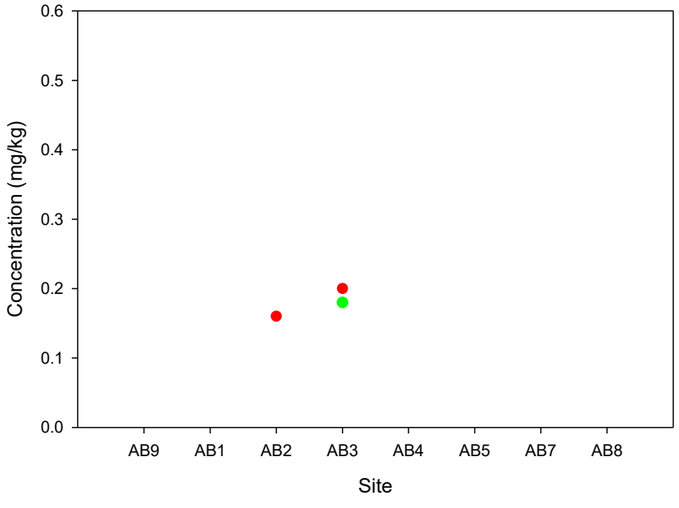
3.5.2 METALS



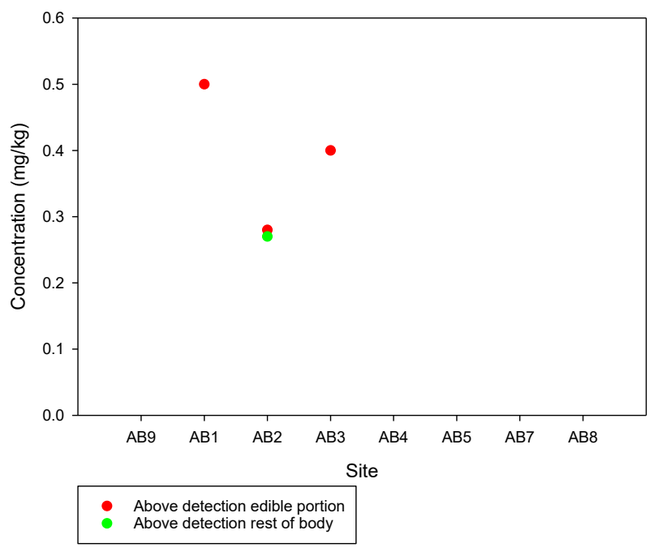
ARSENIC

There are no available guideline values for arsenic in biota tissue therefore the following represents comparative assessment only.

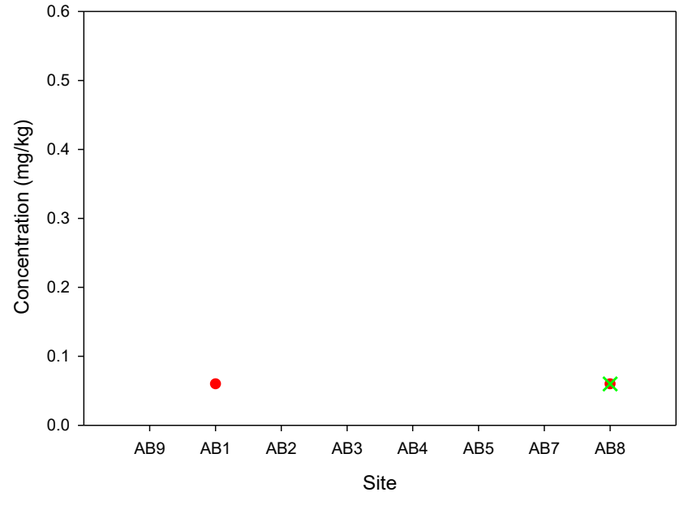


Arsenic was detected at most sites across the study area with no obvious pattern observed. Macrocrustaceans (Atyidae and *Macrobrachium sp*.) tended to have higher arsenic levels than fish, with the highest concentration recorded in *Macrobrachium sp.* at Callide Creek control site AB9. Arsenic is naturally higher in crustacean tissue compared to fish tissue and values do not indicate obvious arsenic contamination in the receiving environment (Stewart & Turnbull, 2015).

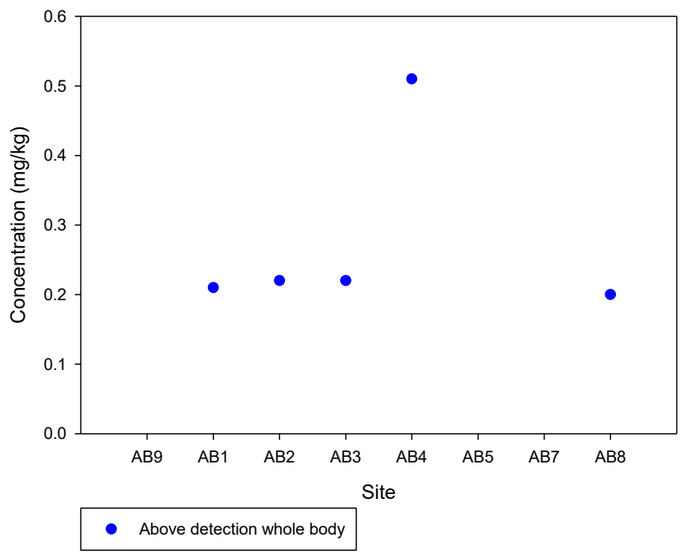
Arsenic levels did not vary considerably between the edible portion and the rest of body in the *L. calcarifer* tested.



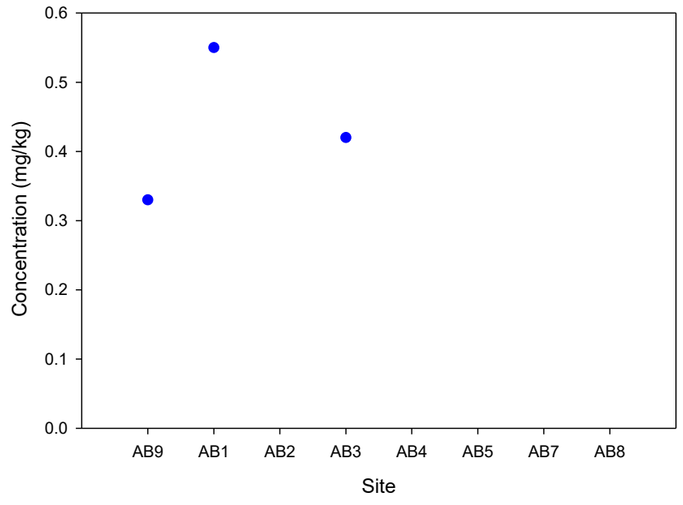
Ambassis agassizii



Lates calcarifer



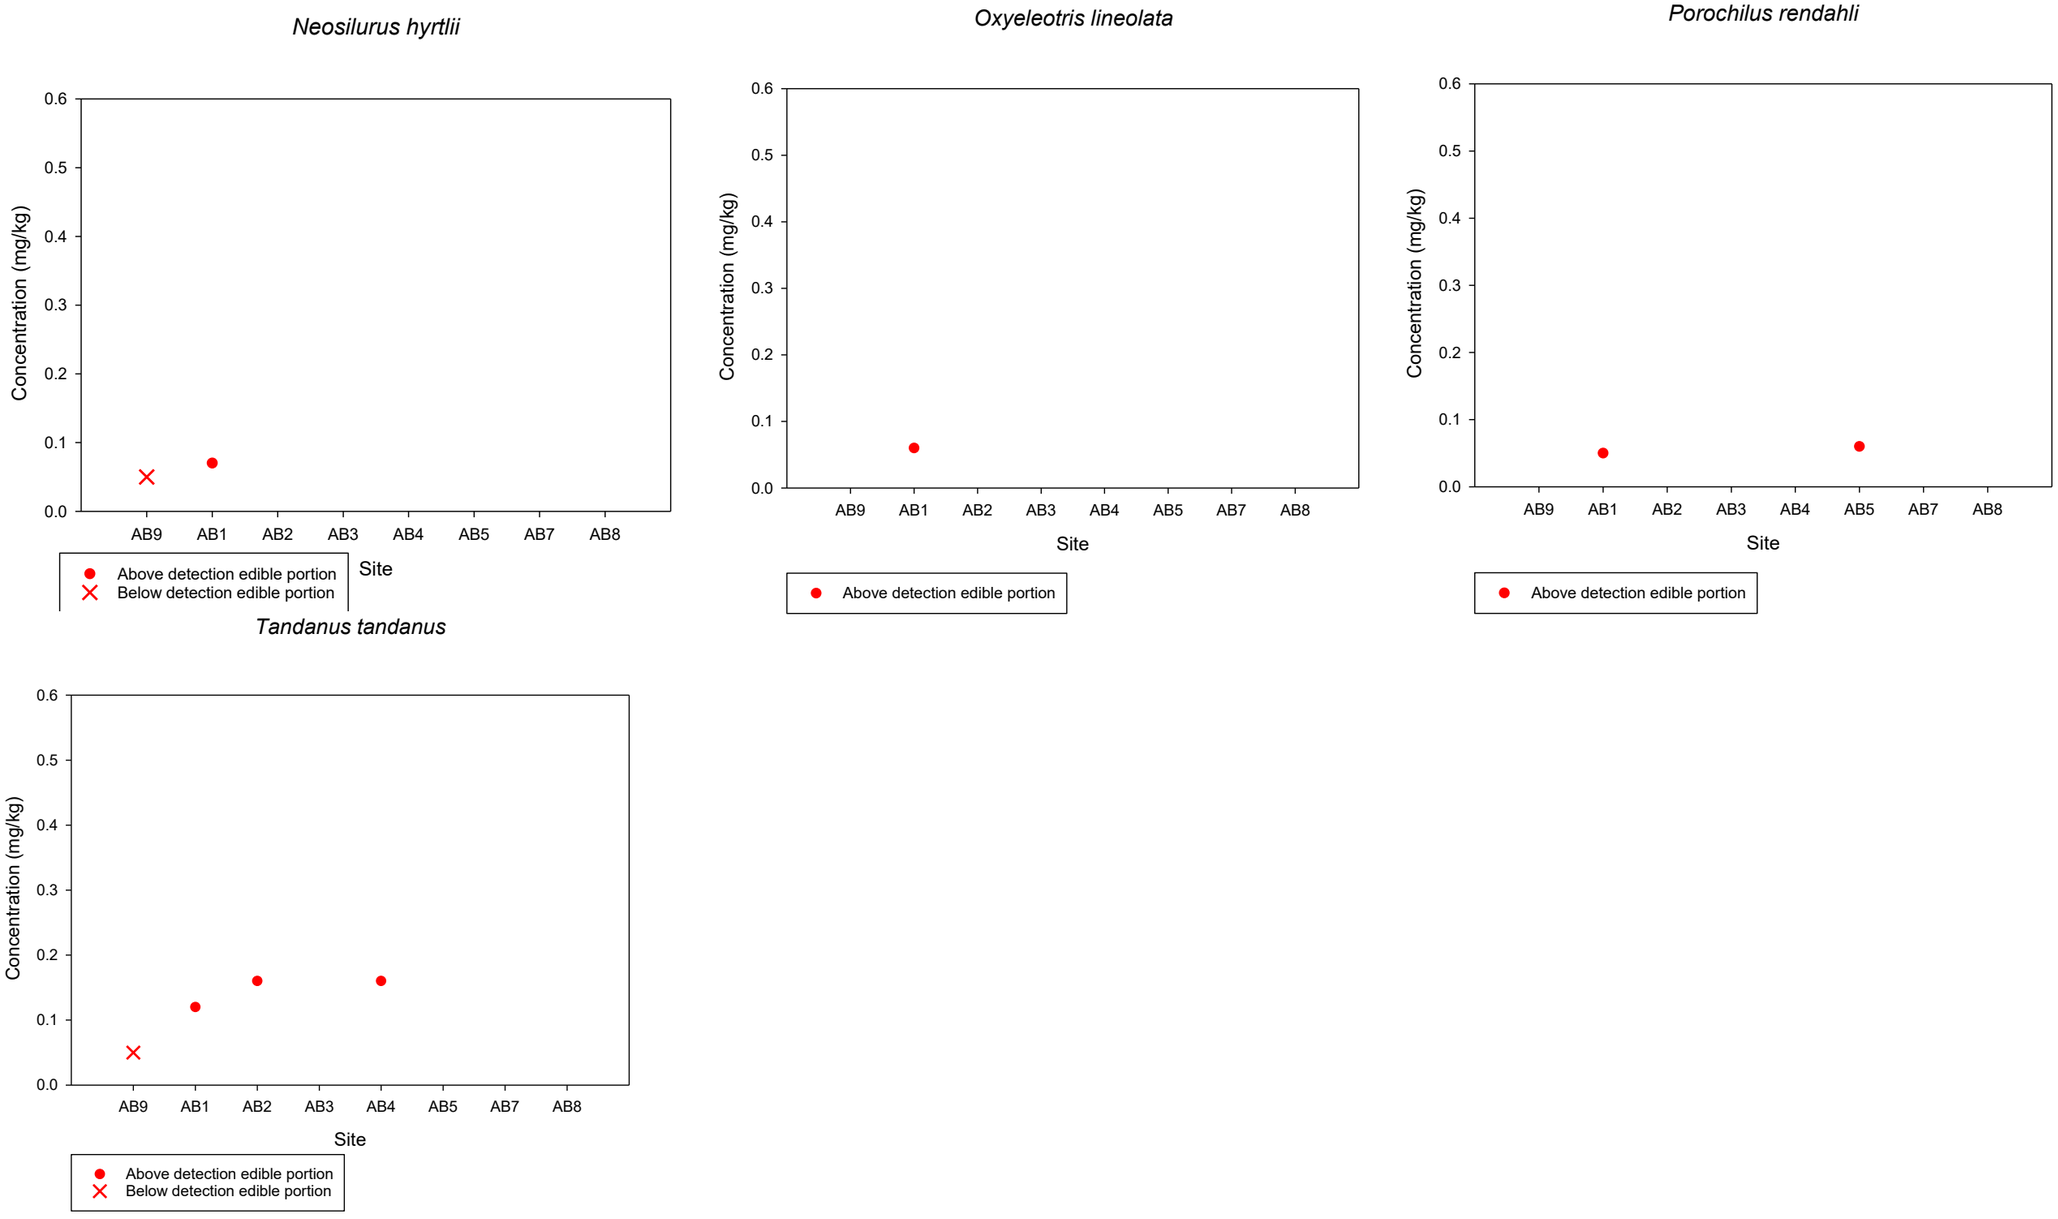
Cherax quadricarinatus



Macquaria ambigua

Craterocephalus stercusmuscarum

Macrobrachium sp.



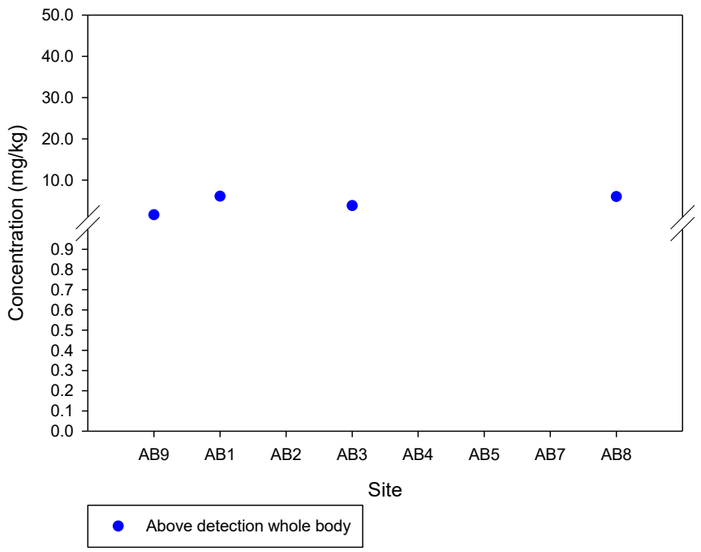


Figure 3-23 Arsenic concentration in biota tissue.

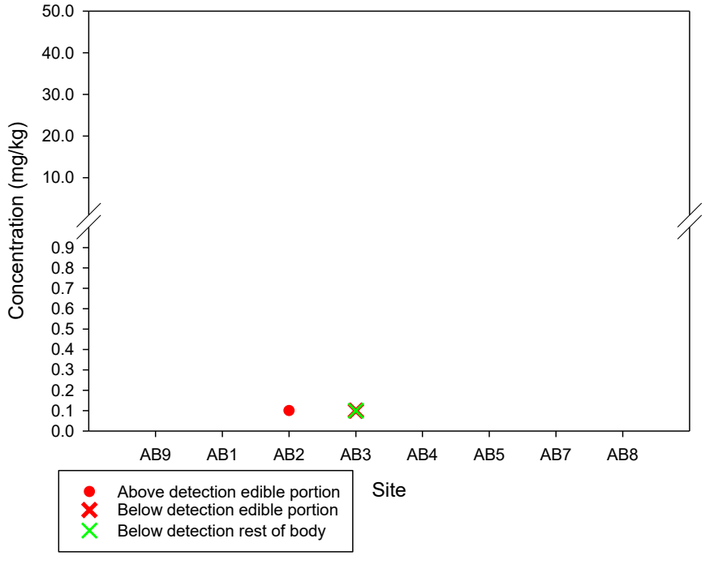
BARIUM



There are no available guideline values for barium in biota tissue therefore the following represents comparative assessment only.

Barium was detected at most sites with no obvious relationship differences between test and control/reference sites (Figure 3-24). Similar to arsenic, levels tended to be higher in macrocrustaceans (*C. quaricarinatus* and *Macrobrachium sp.*,) compared to fish, with the highest value recorded in *C. quadricarinatus* at control site AB1. Barium is known to be naturally higher in crustaceans relative to fish (Verbruggen et al., 2020).

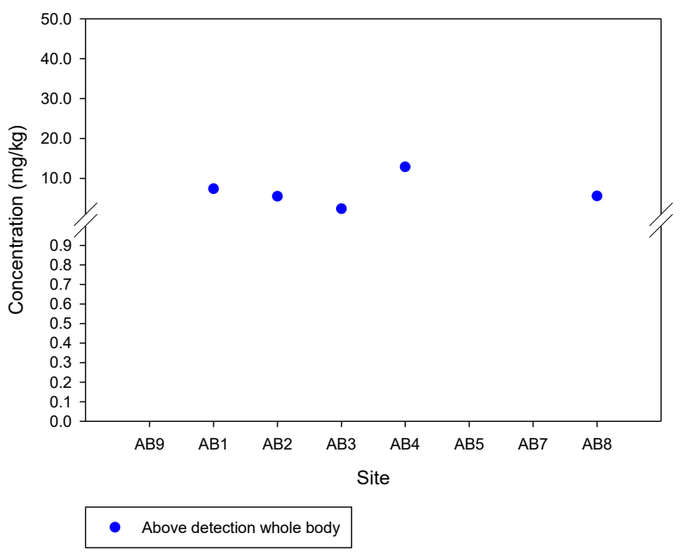
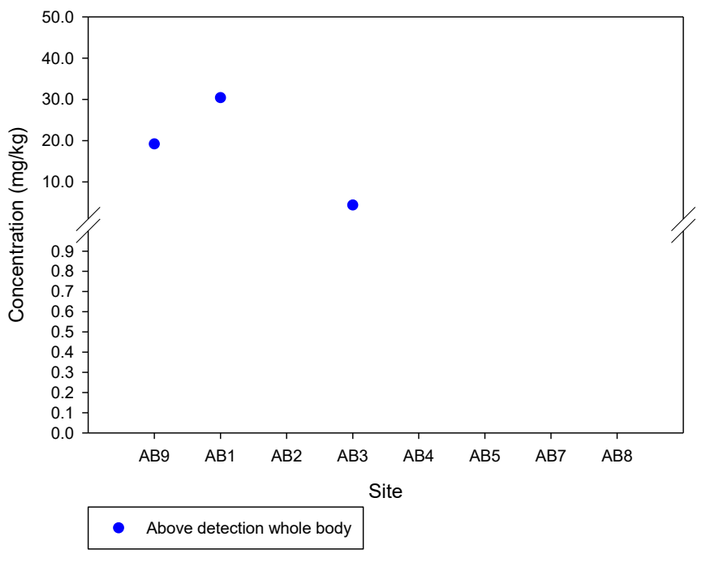
Lates calcarifer



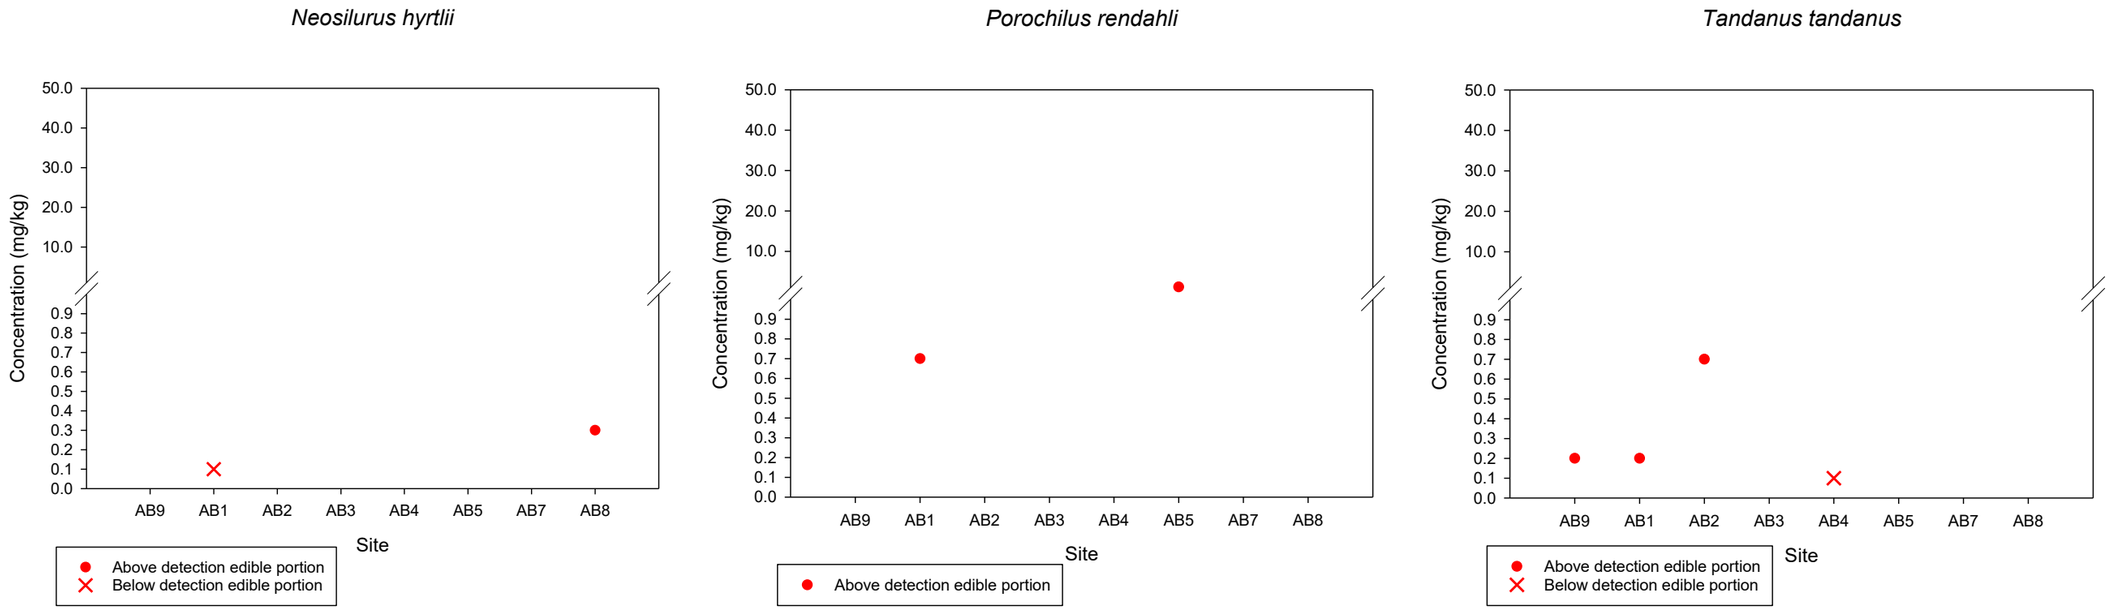
Cherax quadricarinatus



Macquaria ambigua

Craterocephalus stercusmuscarum

Macrobrachium sp.



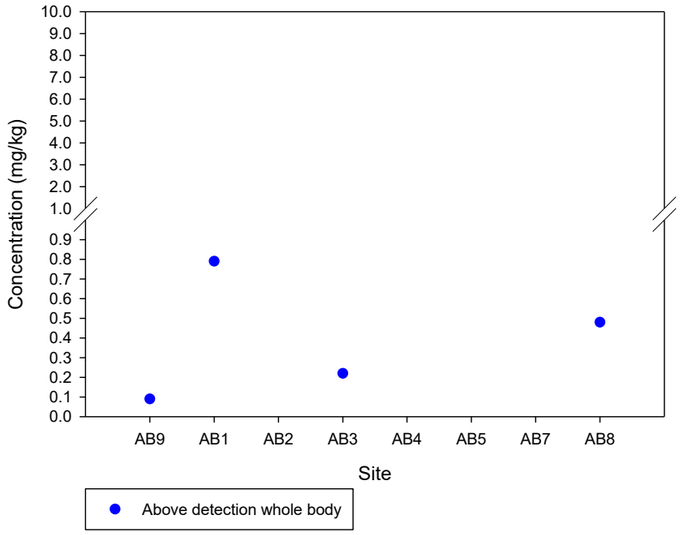


Figure 3-24 Barium concentration in biota tissue.

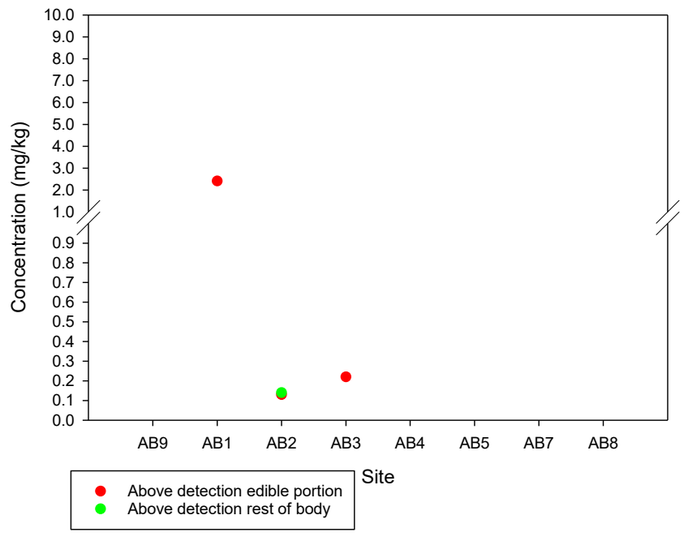
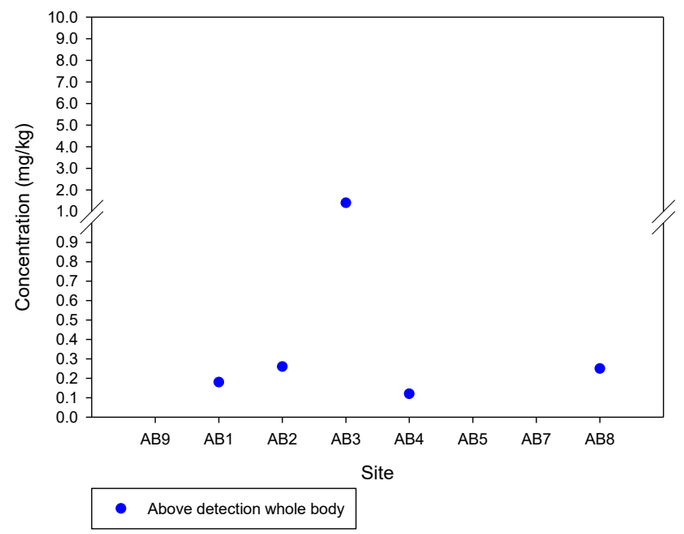
CHROMIUM

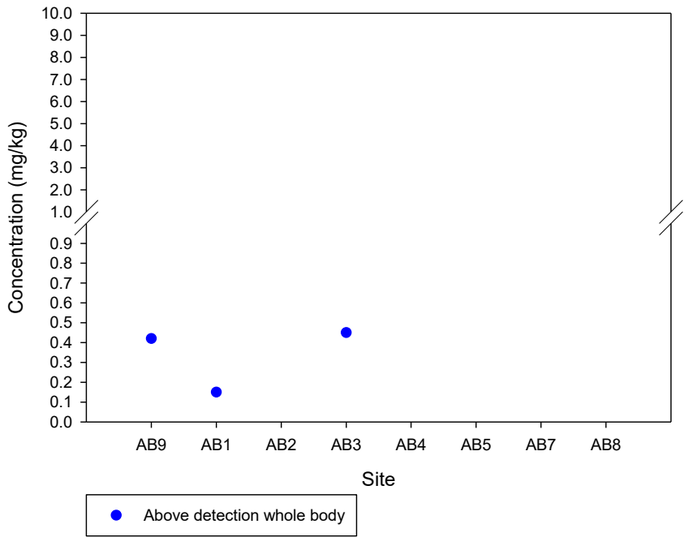


There are no available guideline values for chromium in biota tissue therefore the following represents comparative assessment only.

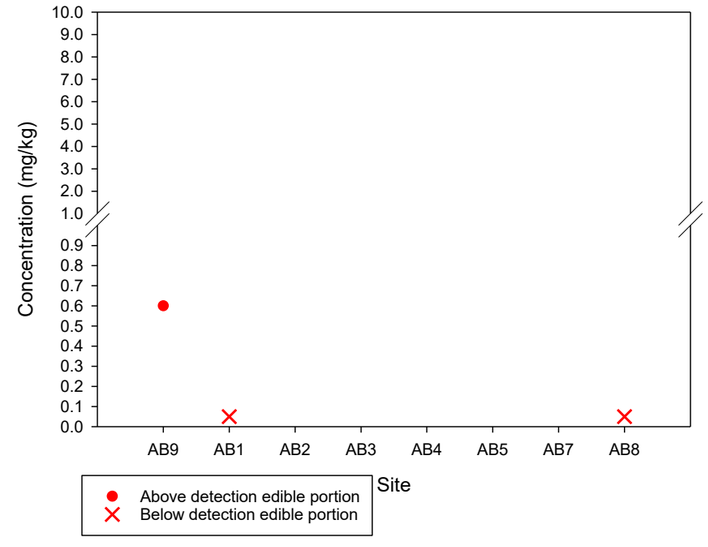
Chromium was detected at most sites with no obvious relationship between test and control/reference sites, however notable elevations were recorded at control site AB1 and test sites on Lake Callide (Figure 3-25). The highest chromium value was recorded in *T. tandanus* at control site AB1.



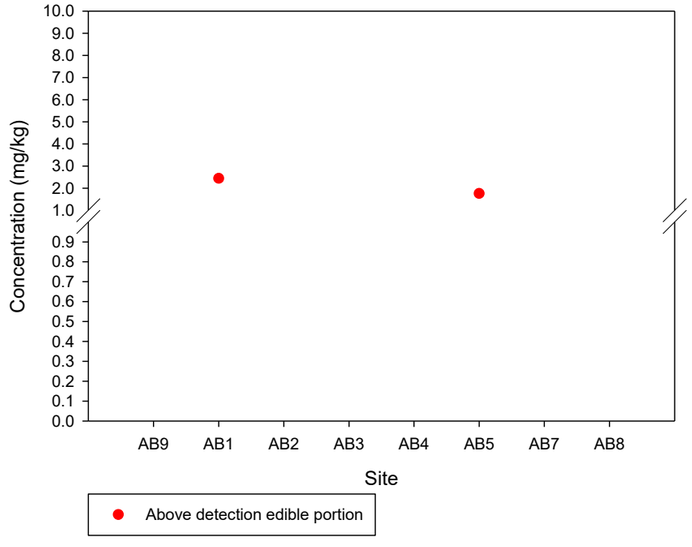
Ambassis agassizii



Cherax quadricarinatus



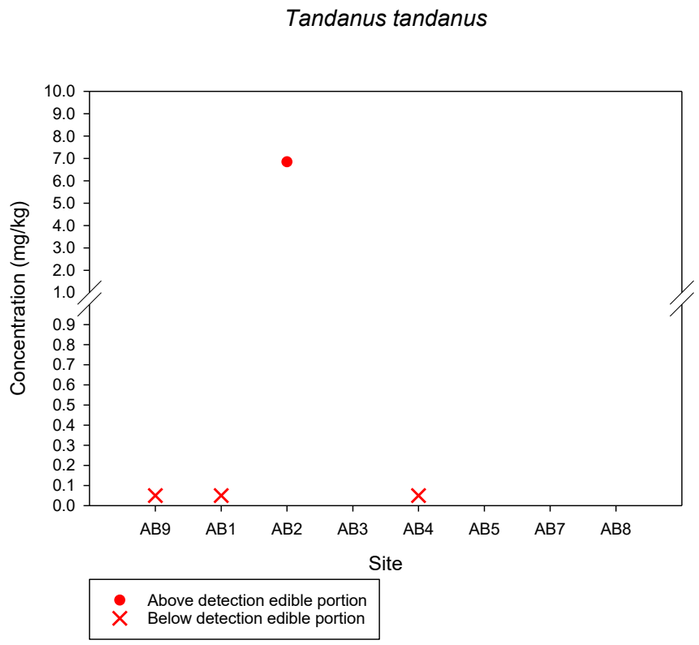
Craterocephalus stercusmuscarum



Macrobrachium sp.

Neosilurus hyrtlii

Porochilus rendahli



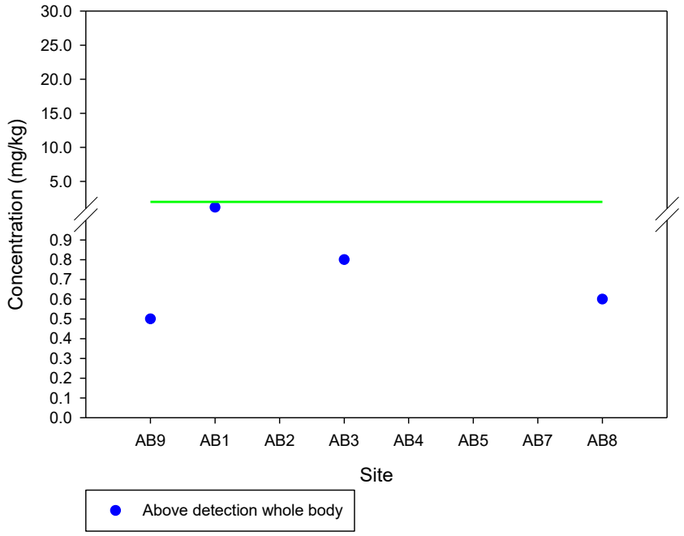


Figure 3-25 Chromium concentration in biota tissue.

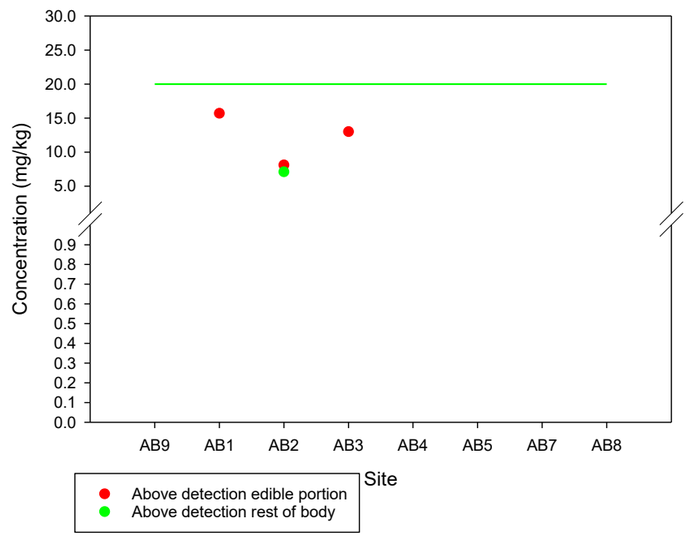
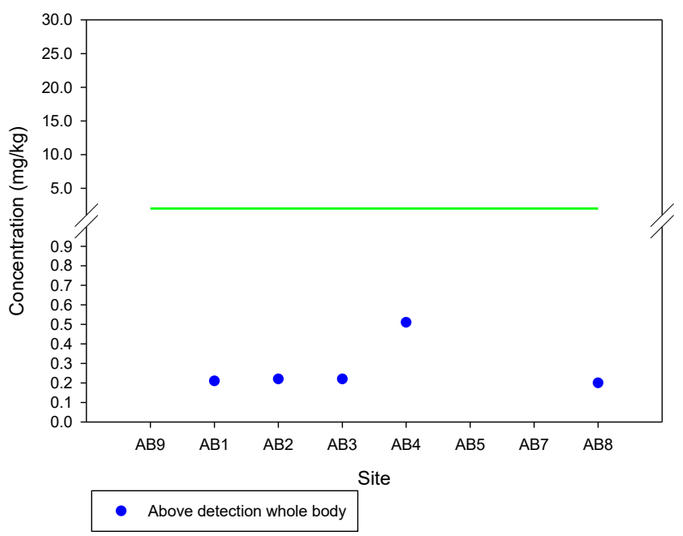


COPPER

Copper was detected at most sites with no obvious relationship between test and control/reference sites (Figure 3-26). All values were below generally expected levels (GELs) except for *Macrobrachium sp.* at control site AB1. Copper levels in the edible portions of *L. calcarifer* and *C. quadricarinatus* were broadly similar to those recorded in the rest of body samples.



Ambassis agassizii

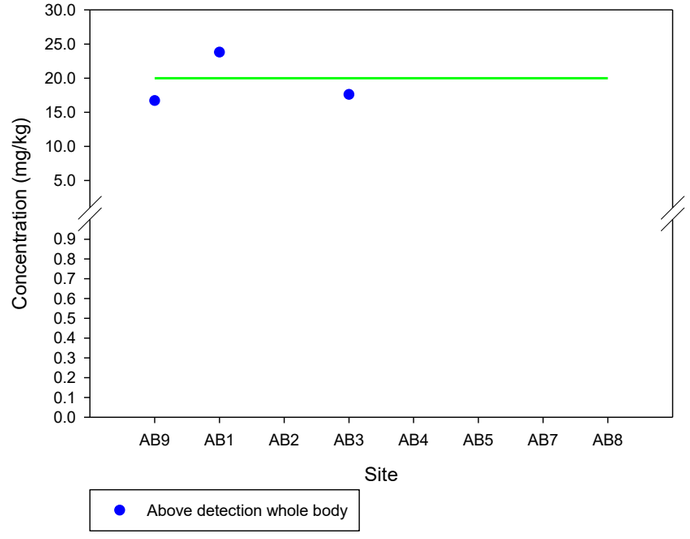
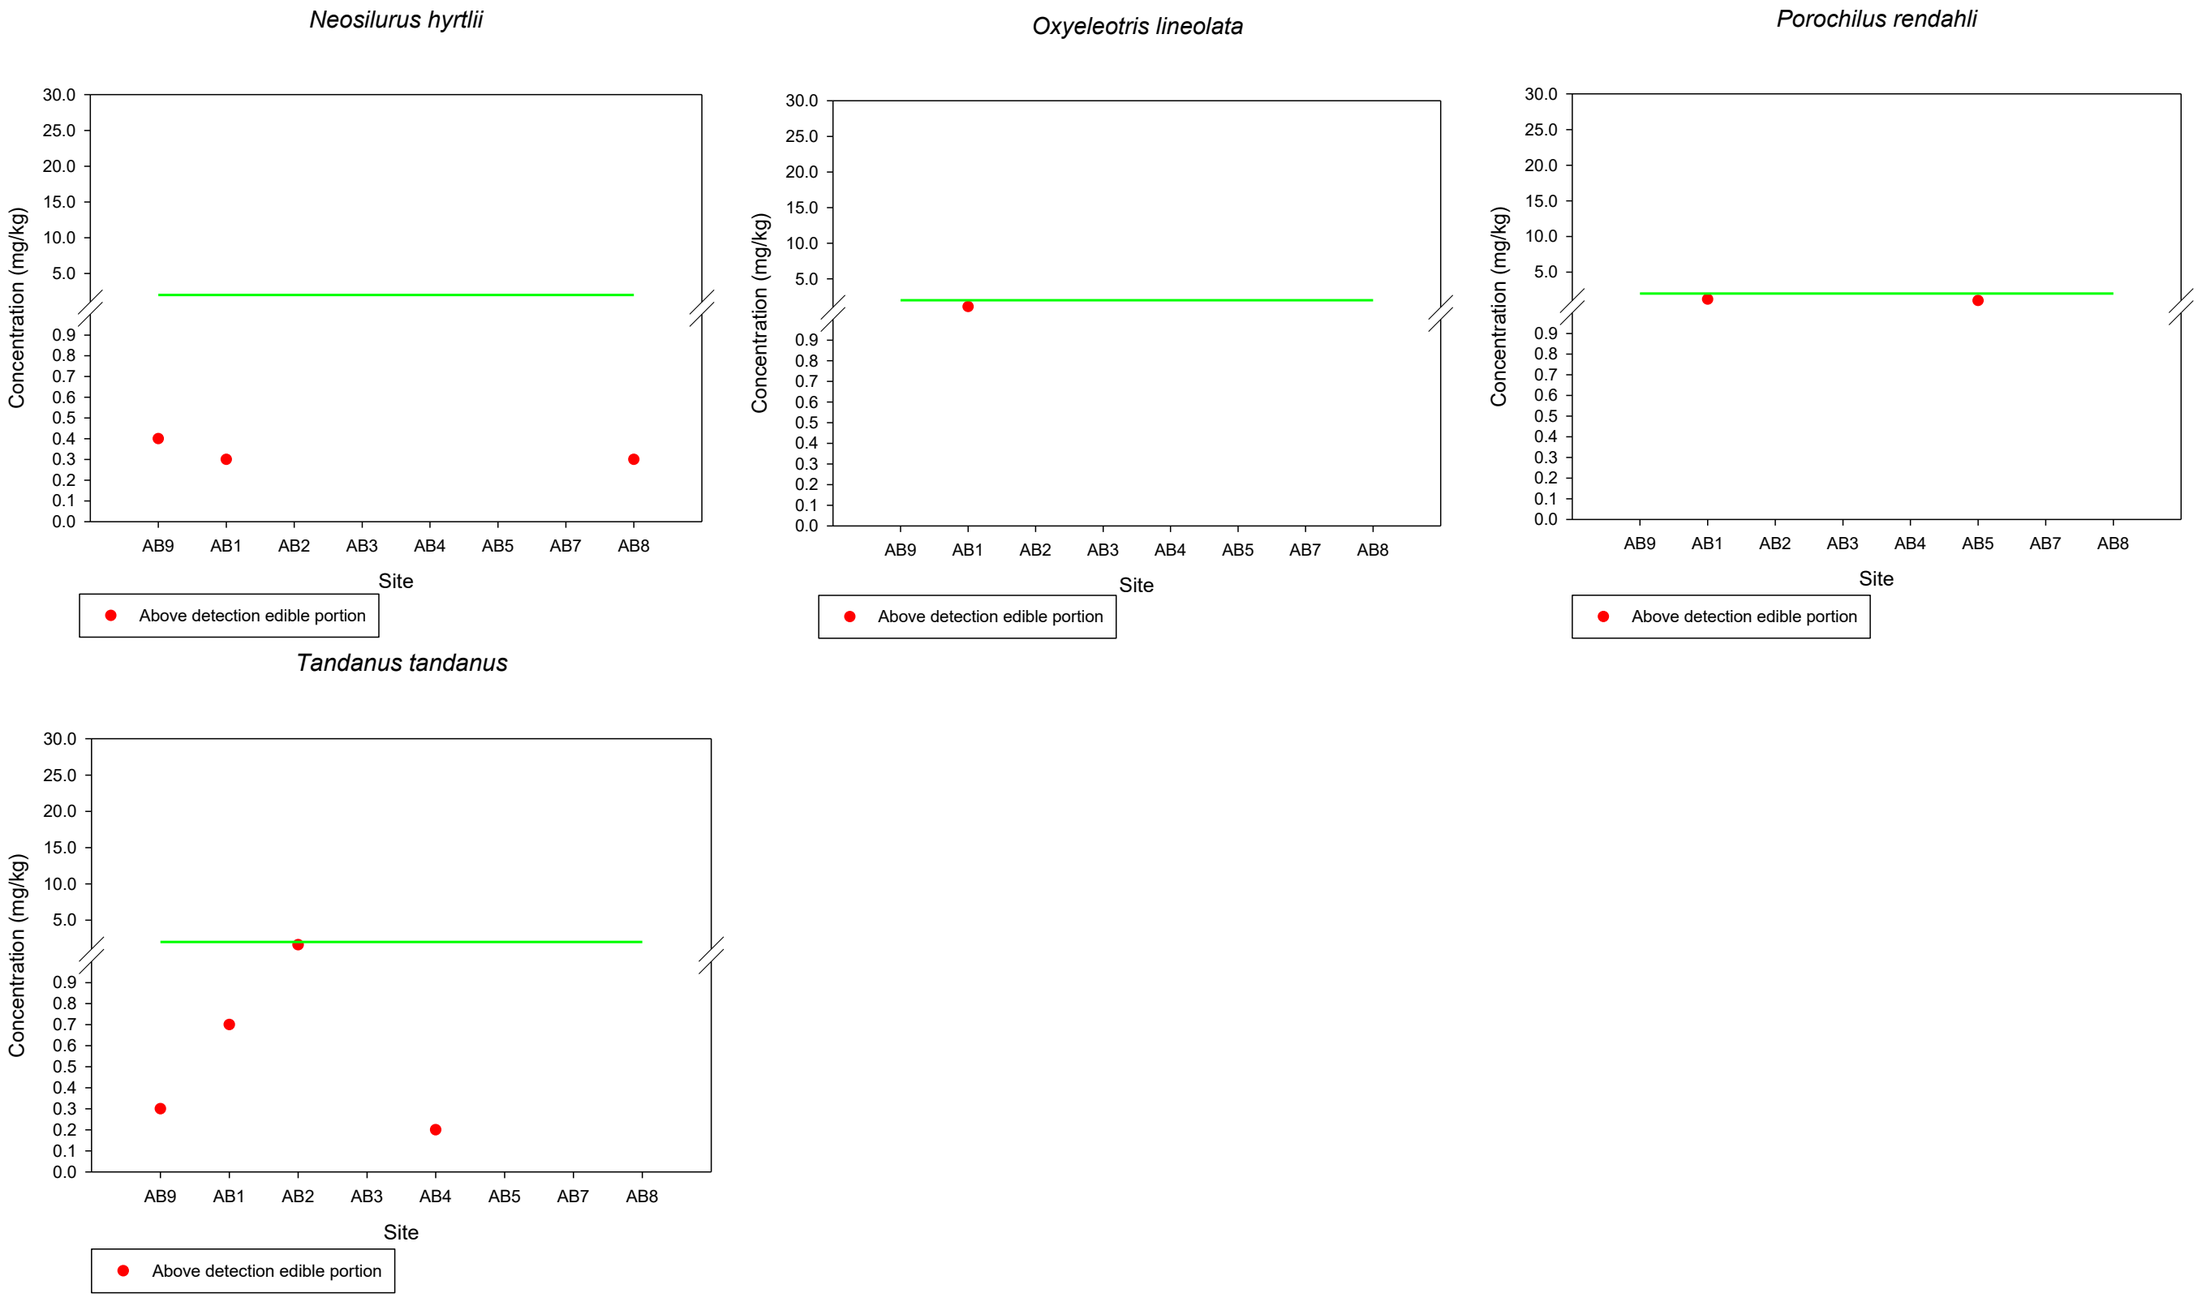
Craterocephalus stercusmuscarum

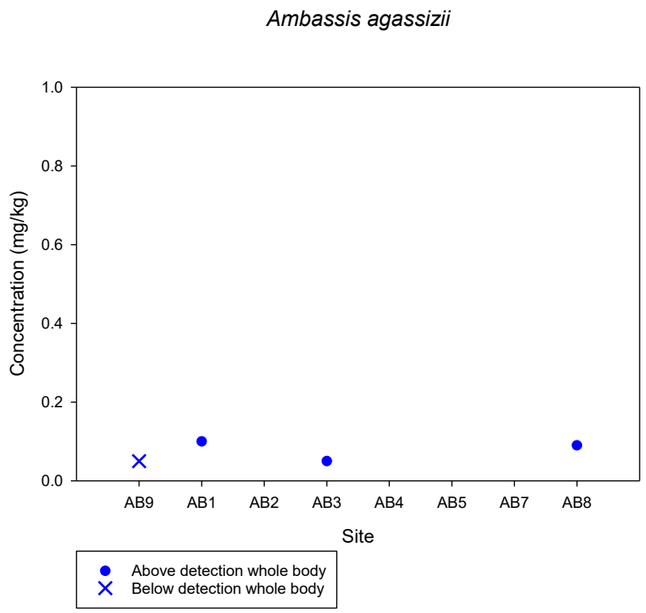


Lates calcarifer

Macquaria ambigua

Macrobrachium sp.





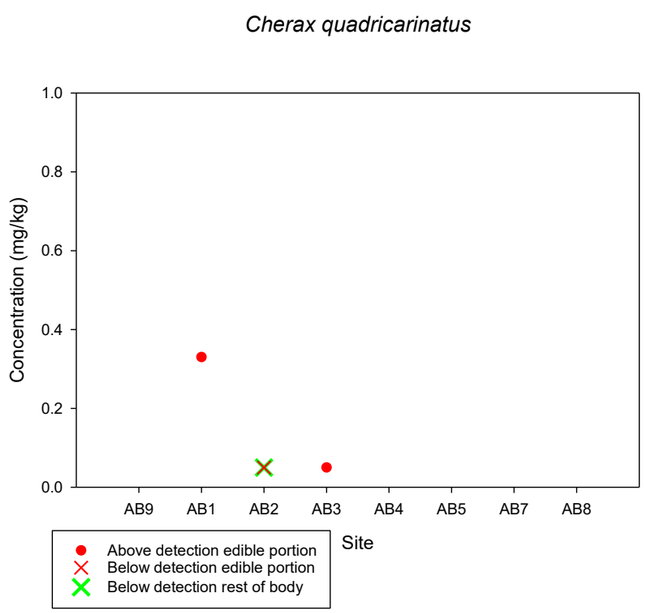


Figure 3-26 Copper concentration in biota tissue. Green lines represent GELs (ANZFA, 2001).

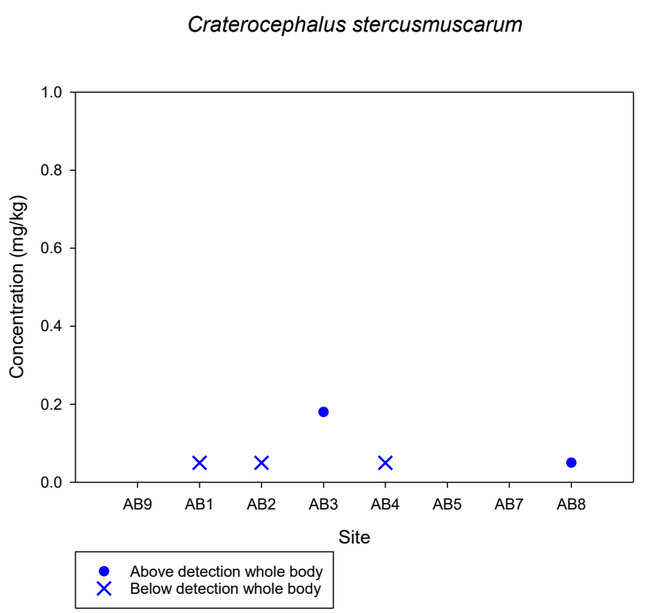
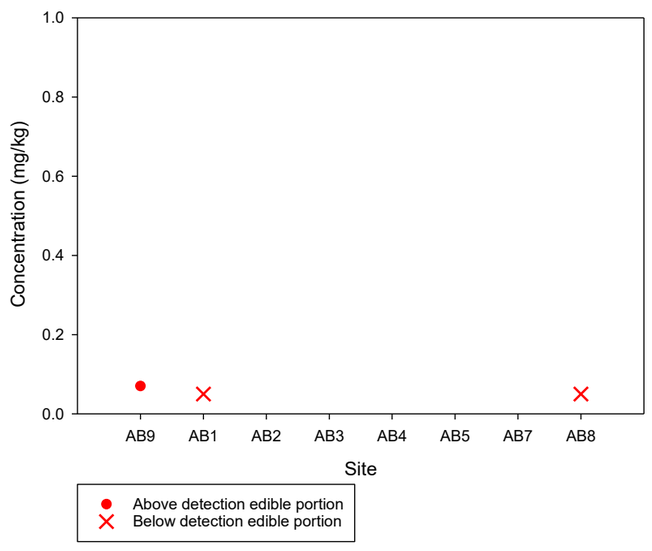
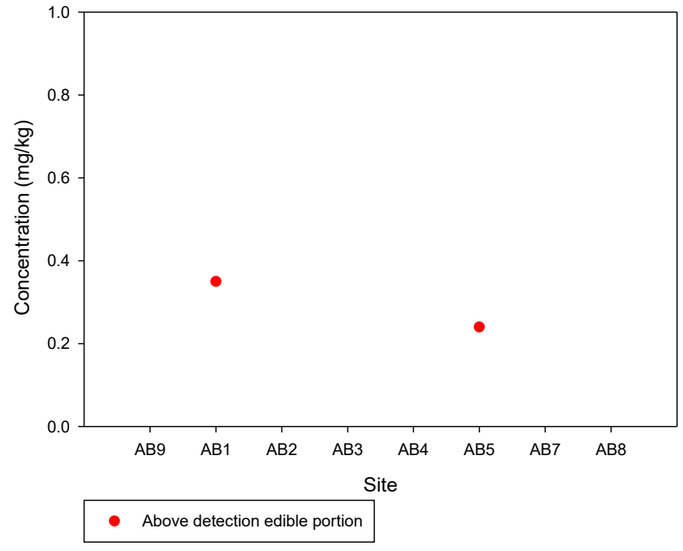


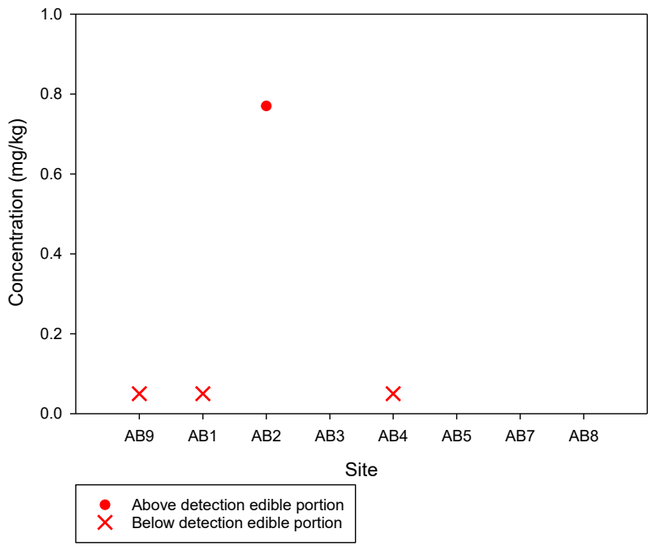
MOLYBDENUM



There are no available guideline values for molybdenum in biota tissue therefore the following represents comparative assessment only.



Molybdenum was detected at most sites with no obvious relationship between test and control/reference sites (Figure 3-27). No molybdenum was detected in either the edible portion or rest of body sample from *N. hyrtlii* at site AB2.



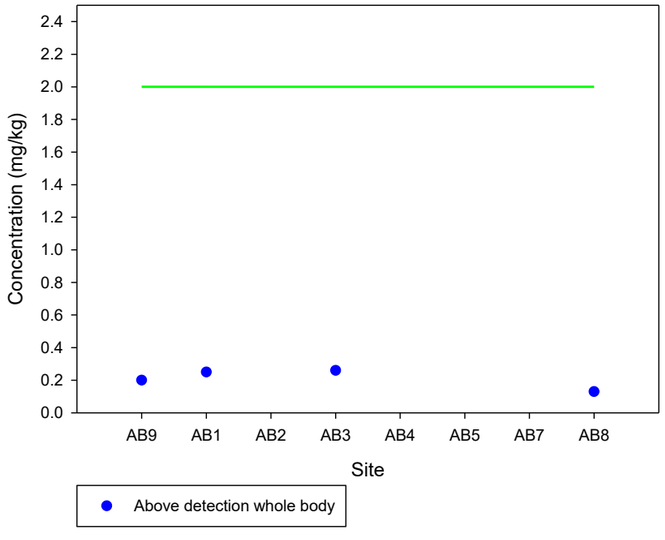


Figure 3-27 Molybdenum concentration in biota tissue.

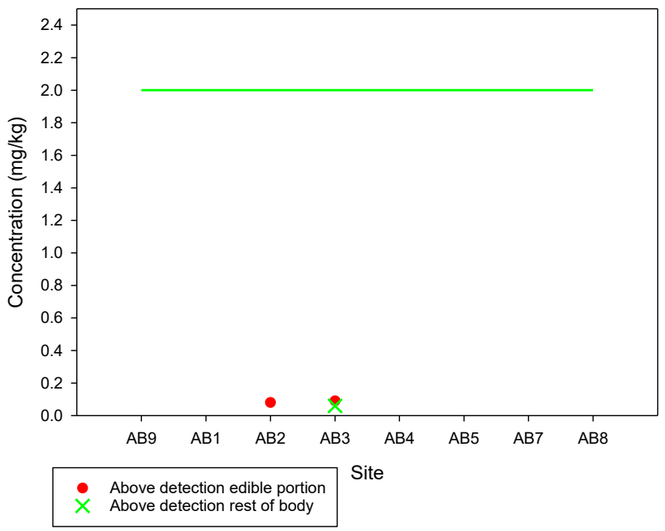
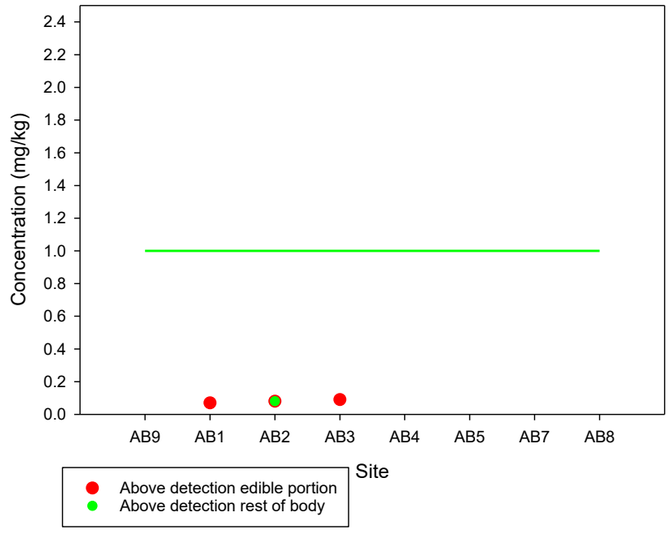
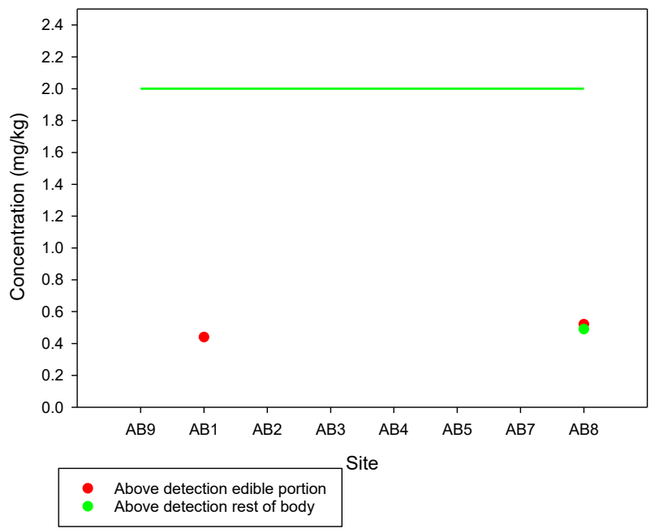


SELENIUM

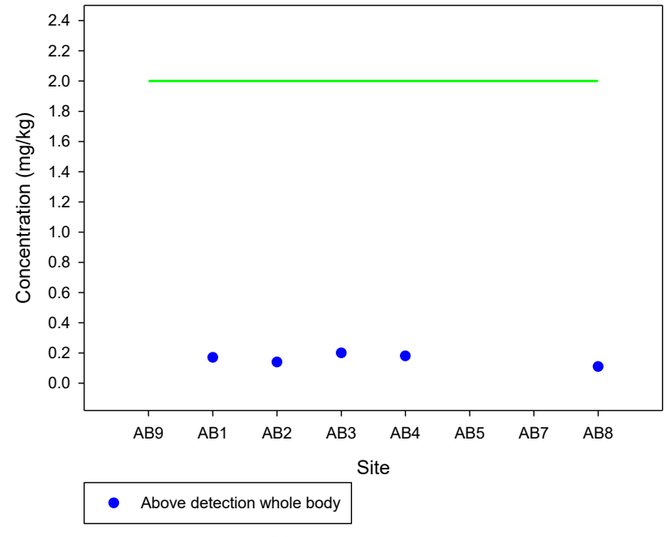
Selenium was detected at most sites with no obvious relationship between test and control/reference sites (Figure 3-28). Levels were below GELs for all sites and there was no difference in concentrations between the edible portion and rest of body samples.



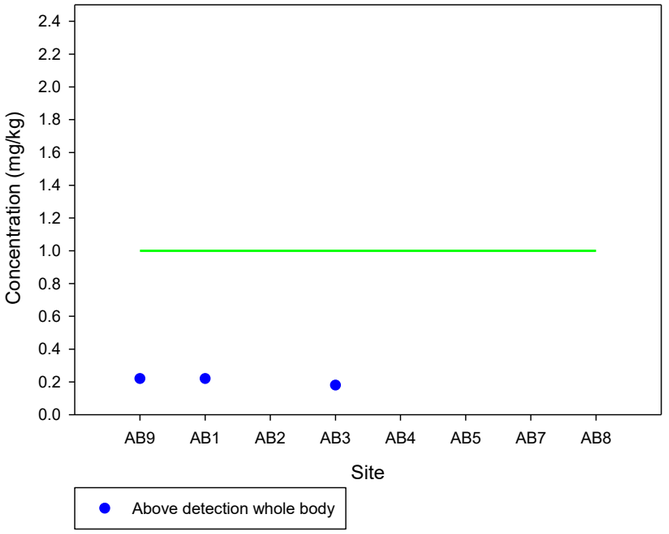
Ambassis agassizii



Lates calcarifer



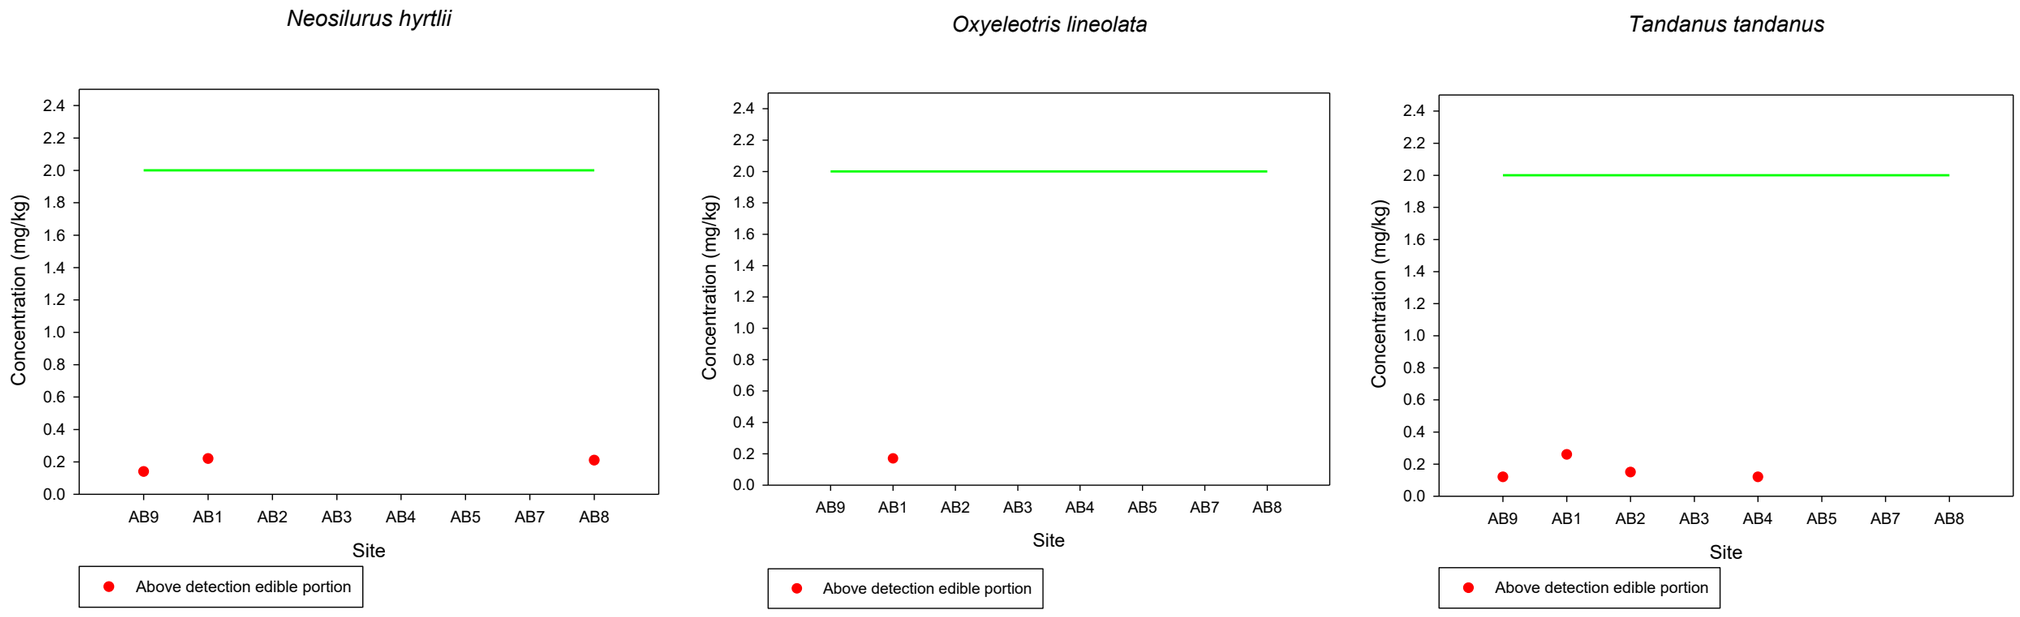
Cherax quadricarinatus



Macquaria ambigua

Craterocephalus stercusmuscarum

Macrobrachium sp.



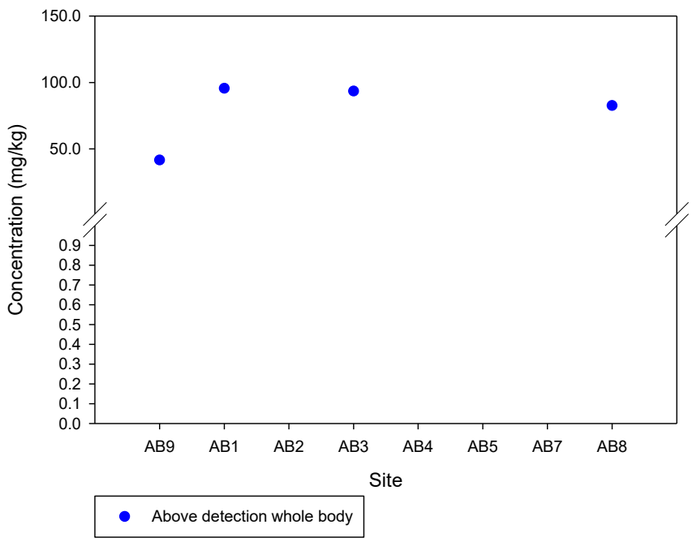


Figure 3-28 Selenium concentration in biota tissue. Green lines represent GELs (ANZFA, 2001).

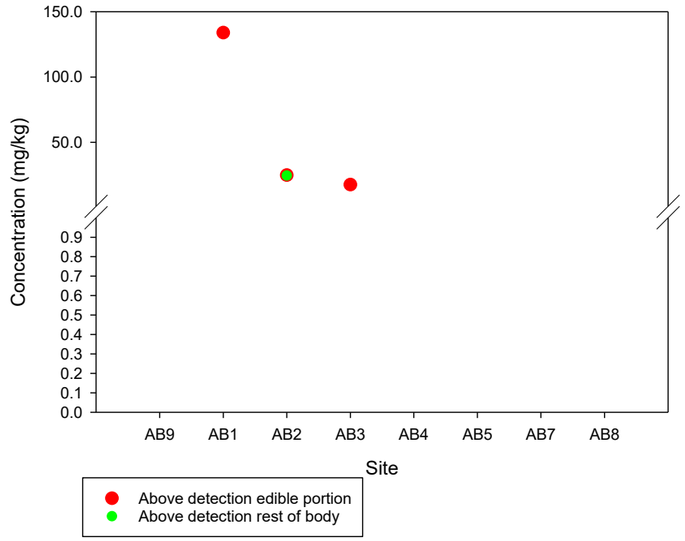
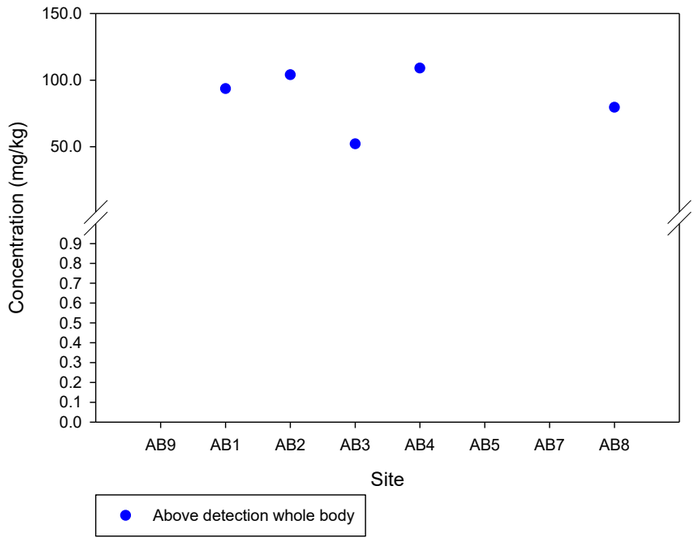
STRONTIUM

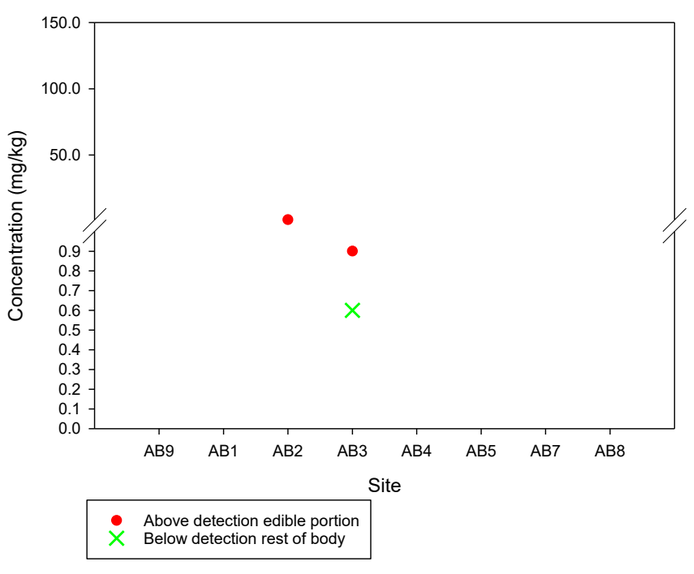


There are no available guideline values for stontium in biota tissue therefore the following represents comparative assessment only.

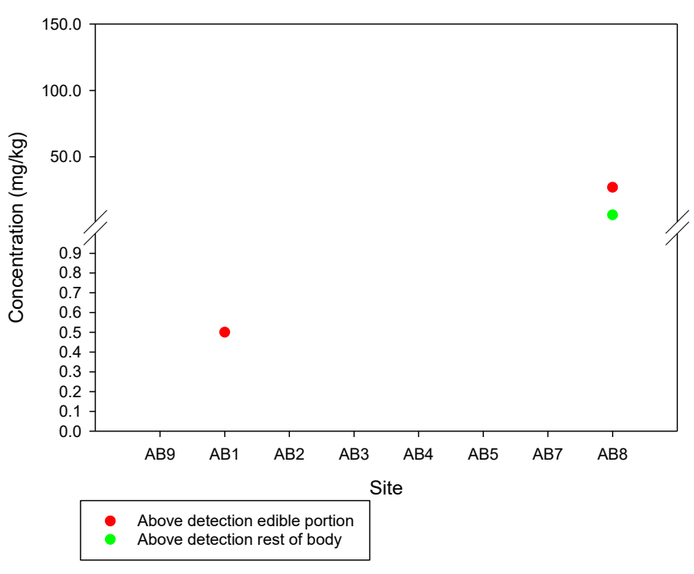
Strontium was detected at most sites with no obvious relationship between treatments (Figure 3-29). Strontium levels were broadly similar in the edible portion and rest of body samples.



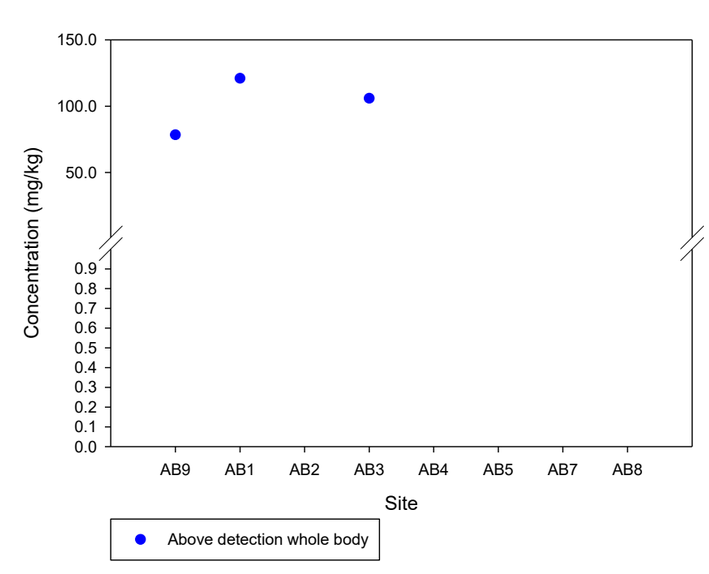
Ambassis agassizii



Cherax quadricarinatus



Craterocephalus stercusmuscarum



Lates calcarifer

Macquaria ambigua

Macrobrachium sp.

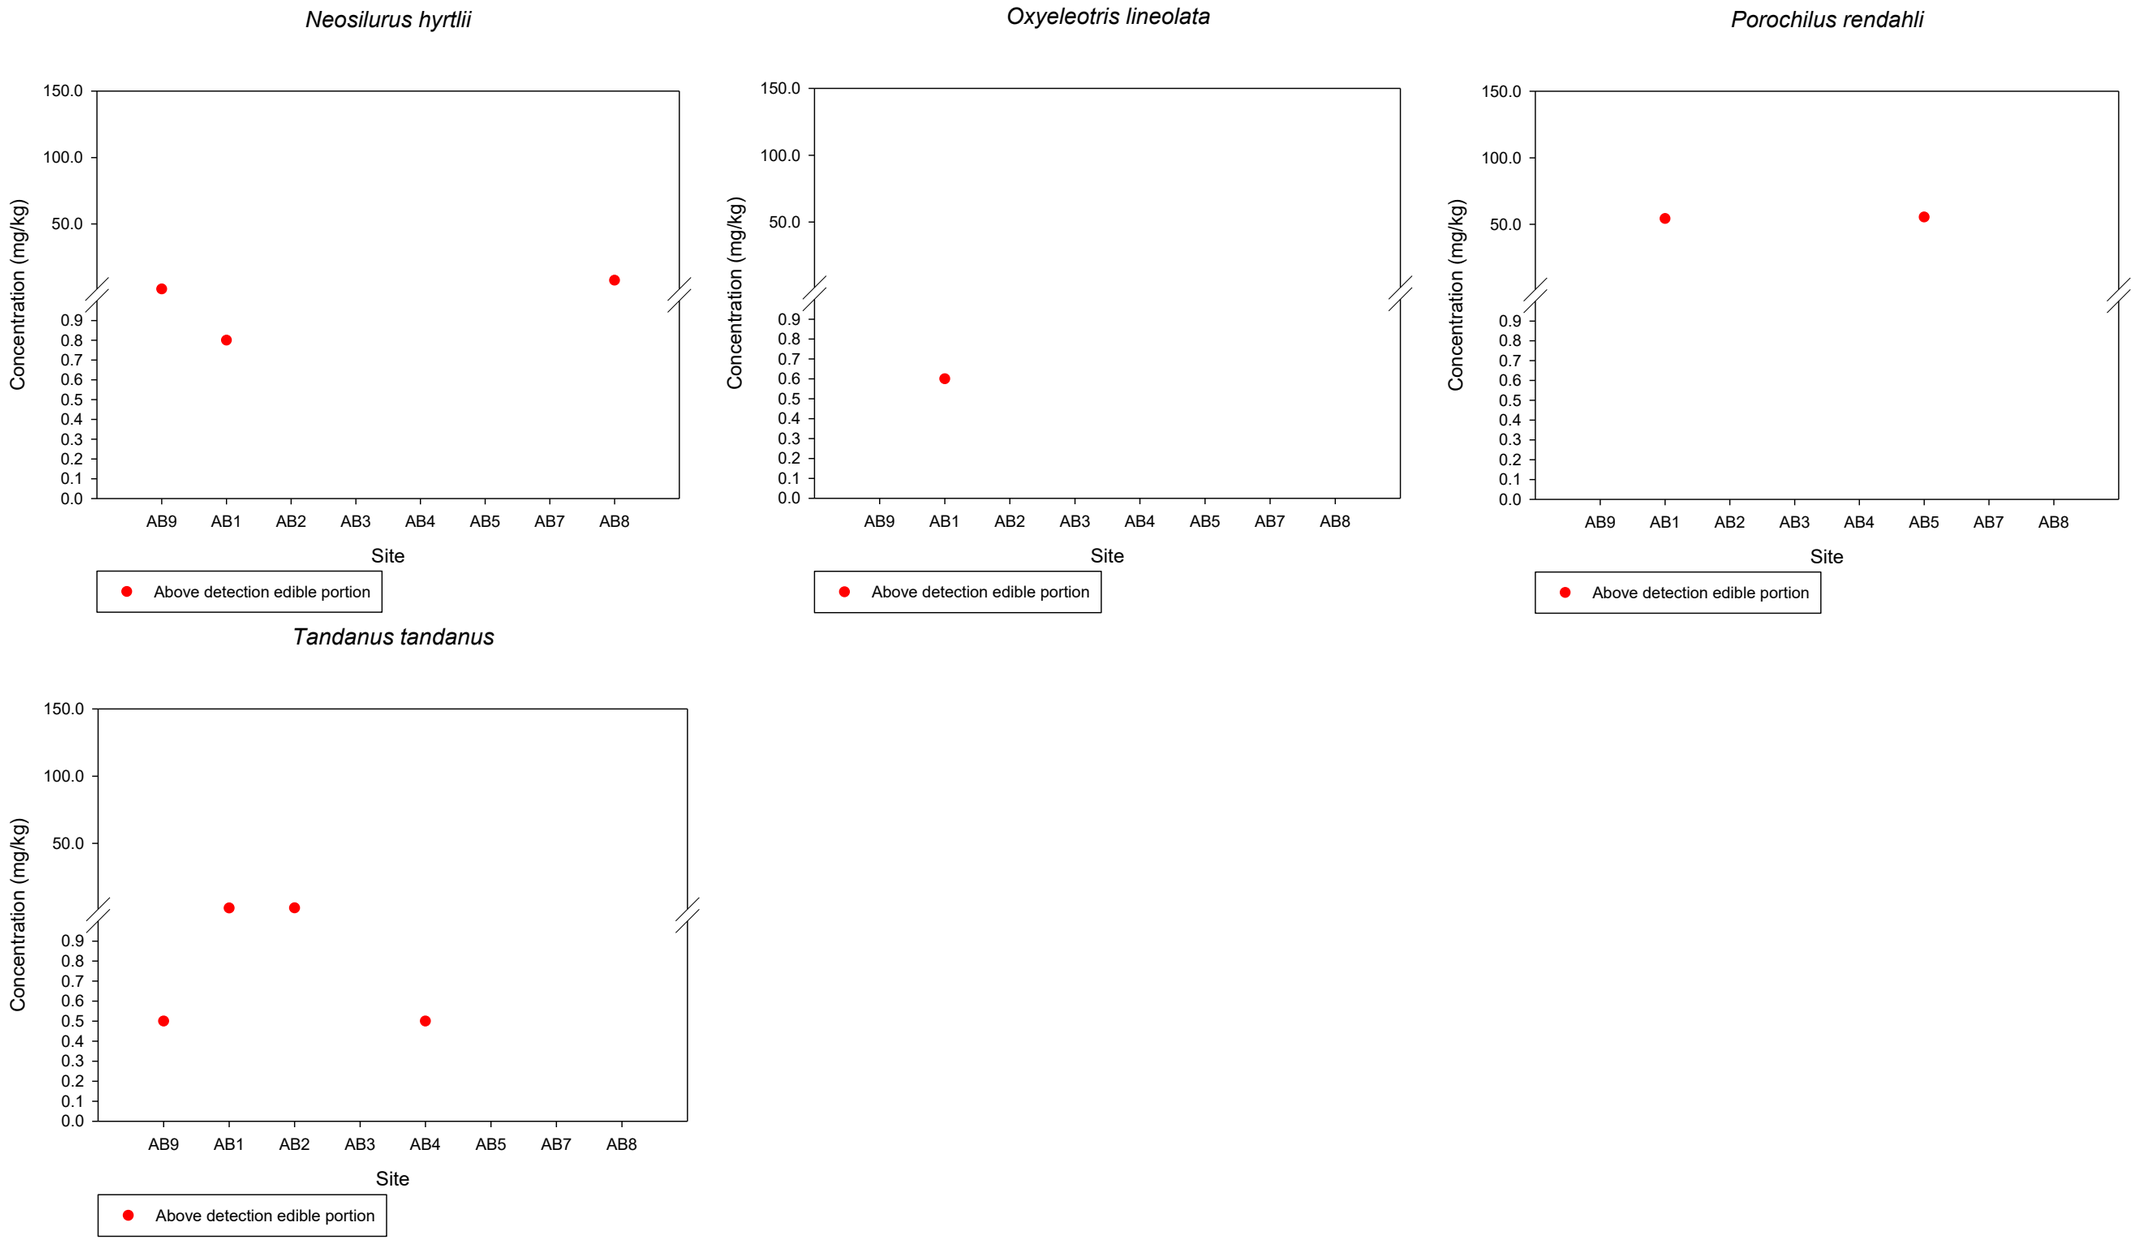


Figure 3-29 Strontium concentration in biota tissue.

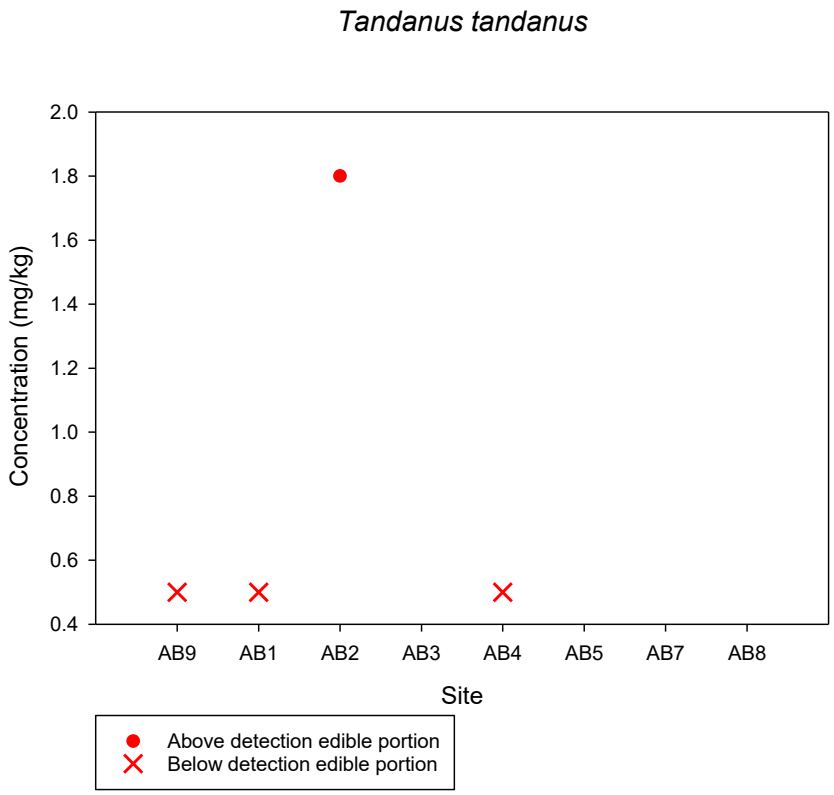
VANADIUM

There are no available guideline values for vanadium in biota tissue therefore the following represents comparative assessment only.

Vanadium detection was limited to a single sample of *T. tandanus* at Lake Callide test site AB2 (Figure 3-30).



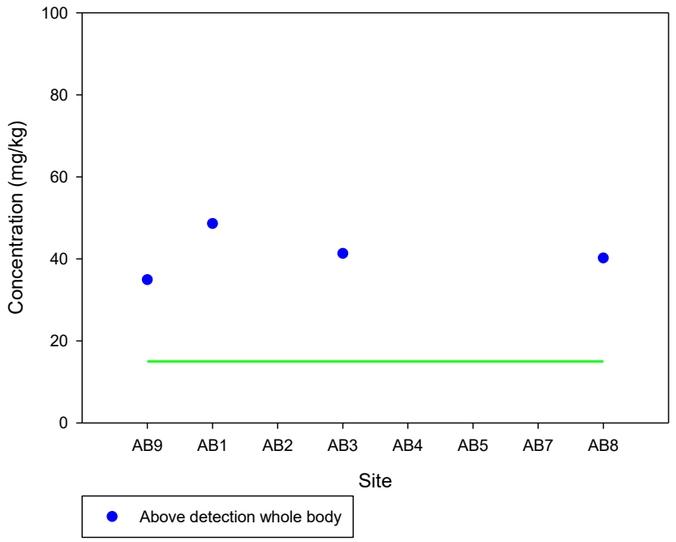


Figure 3-30 Vanadium concentration in biota tissue.

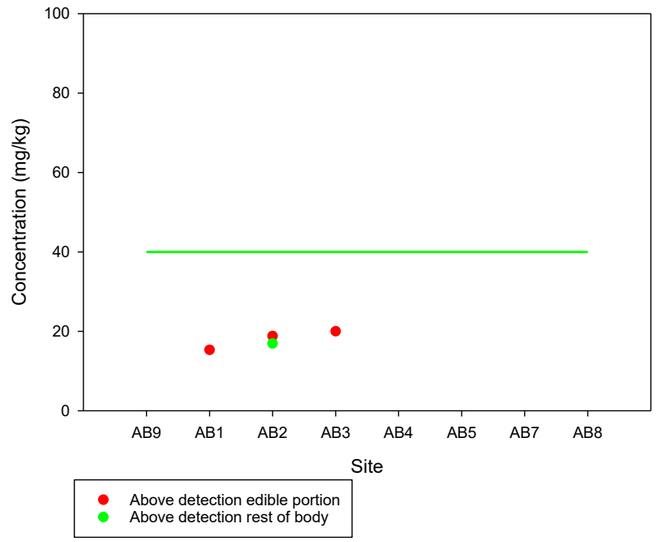
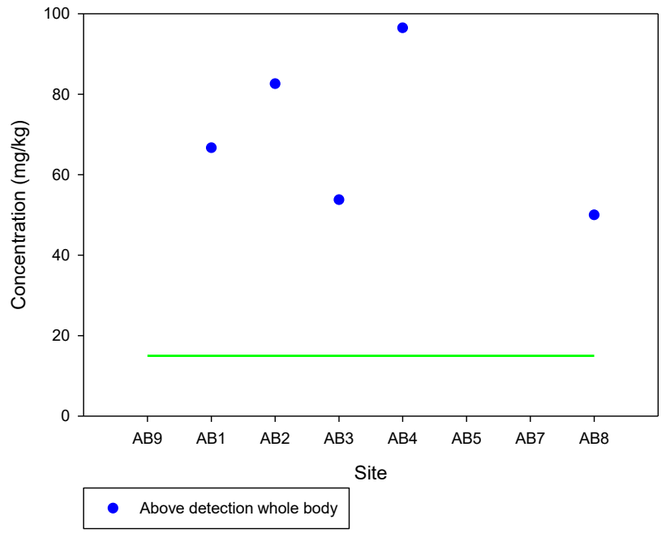
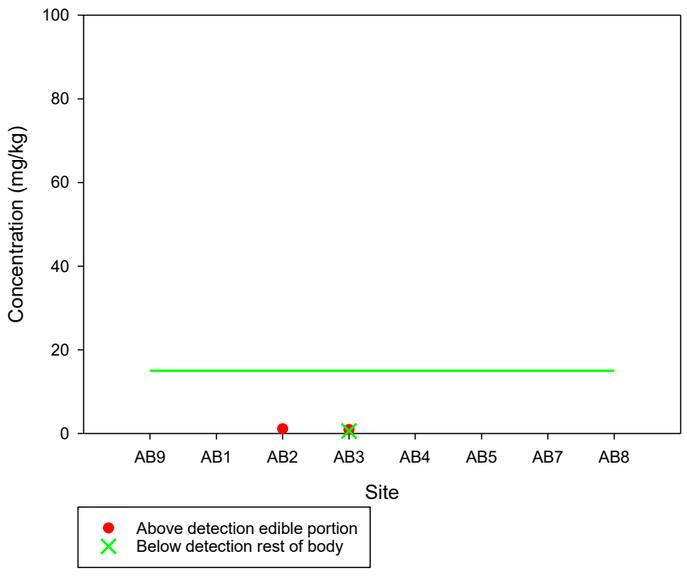


ZINC

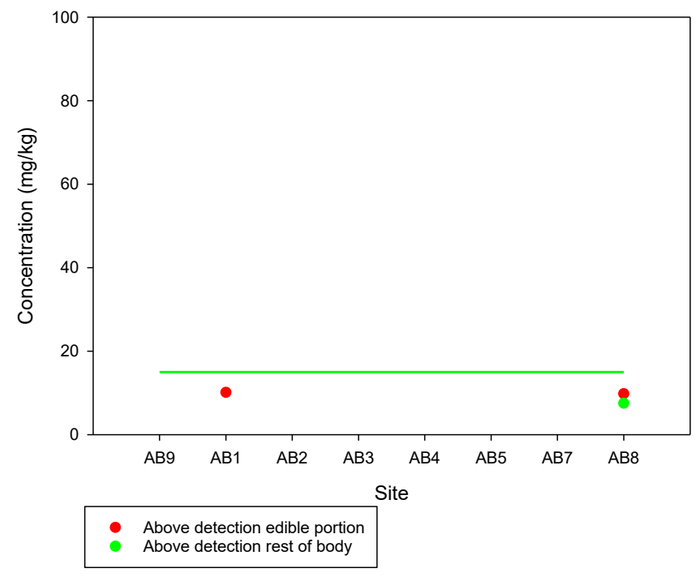
Zinc was detected at most sites with no obvious relationship between treatments (Figure 3-31). Values were above GELs for *A. agassizii*, *C. stercusmuscarum*, *Macrobrachium sp.* and *P. rendahli*, with exceedances occurring at the reference site in Kroombit Lake, both control and test sites on Callide Creek and within Lake Callide. Zinc levels were similar between edible portion and rest of body samples.



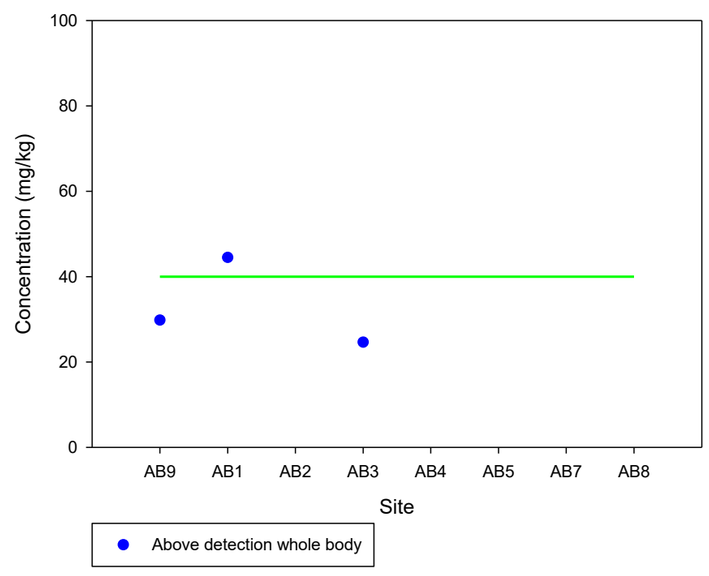
Ambassis agassizii



Cherax quadricarinatus



Craterocephalus stercusmuscarum



Lates calcarifer

Macquaria ambigua

Macrobrachium sp.

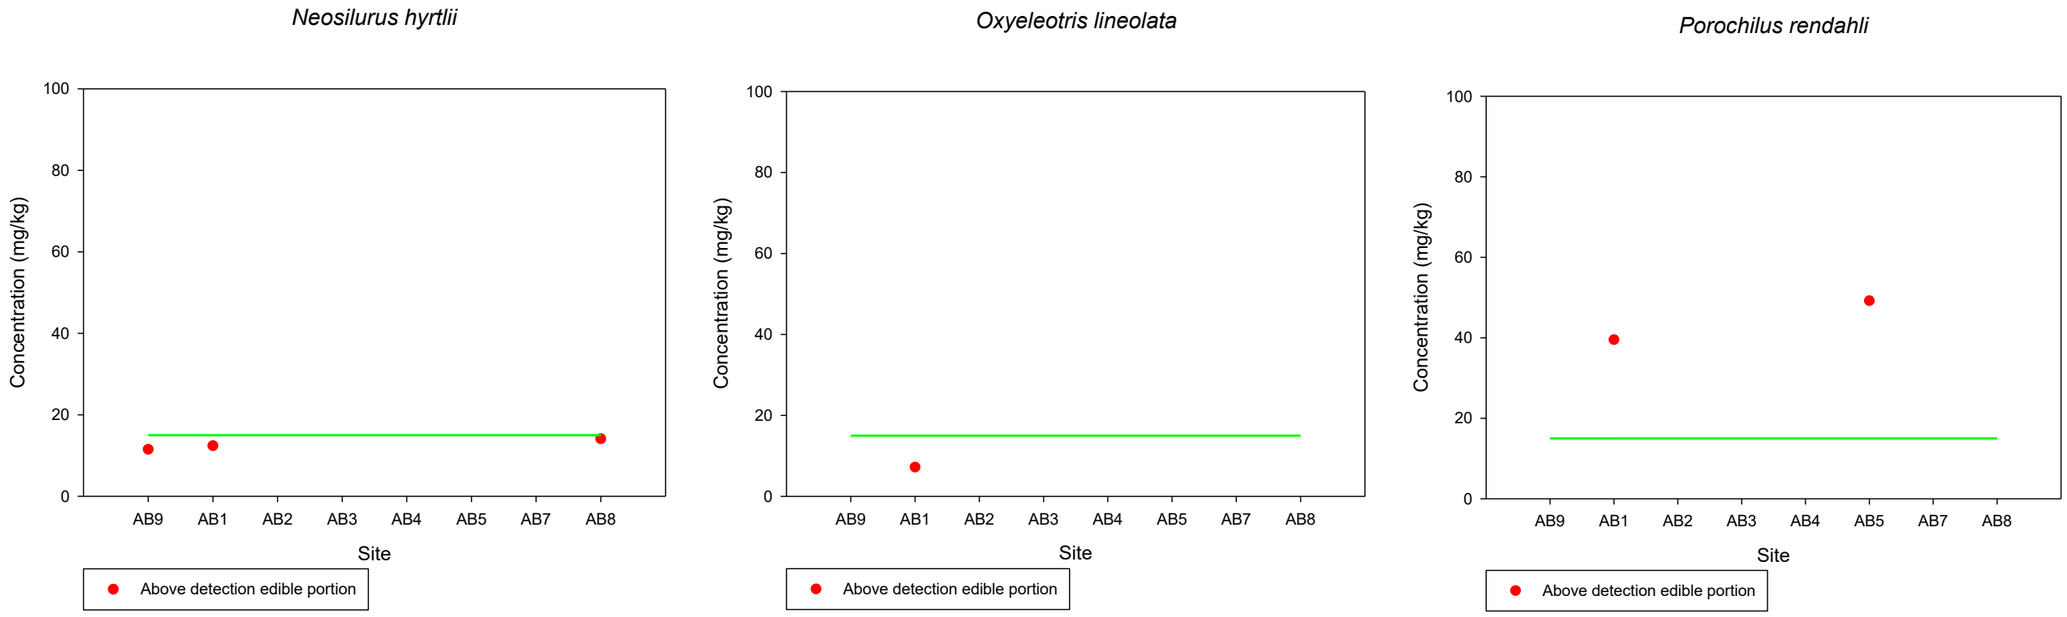


Figure 3-31 Zinc concentration in biota tissue.

THORIUM

There are no available guideline values for thorium in biota tissue therefore the following represents comparative assessment only.

Thorium detections were limited to the control site AB1 and Callide Lake test site AB2, with no detections recorded at Lake Kroombit reference site AB9.

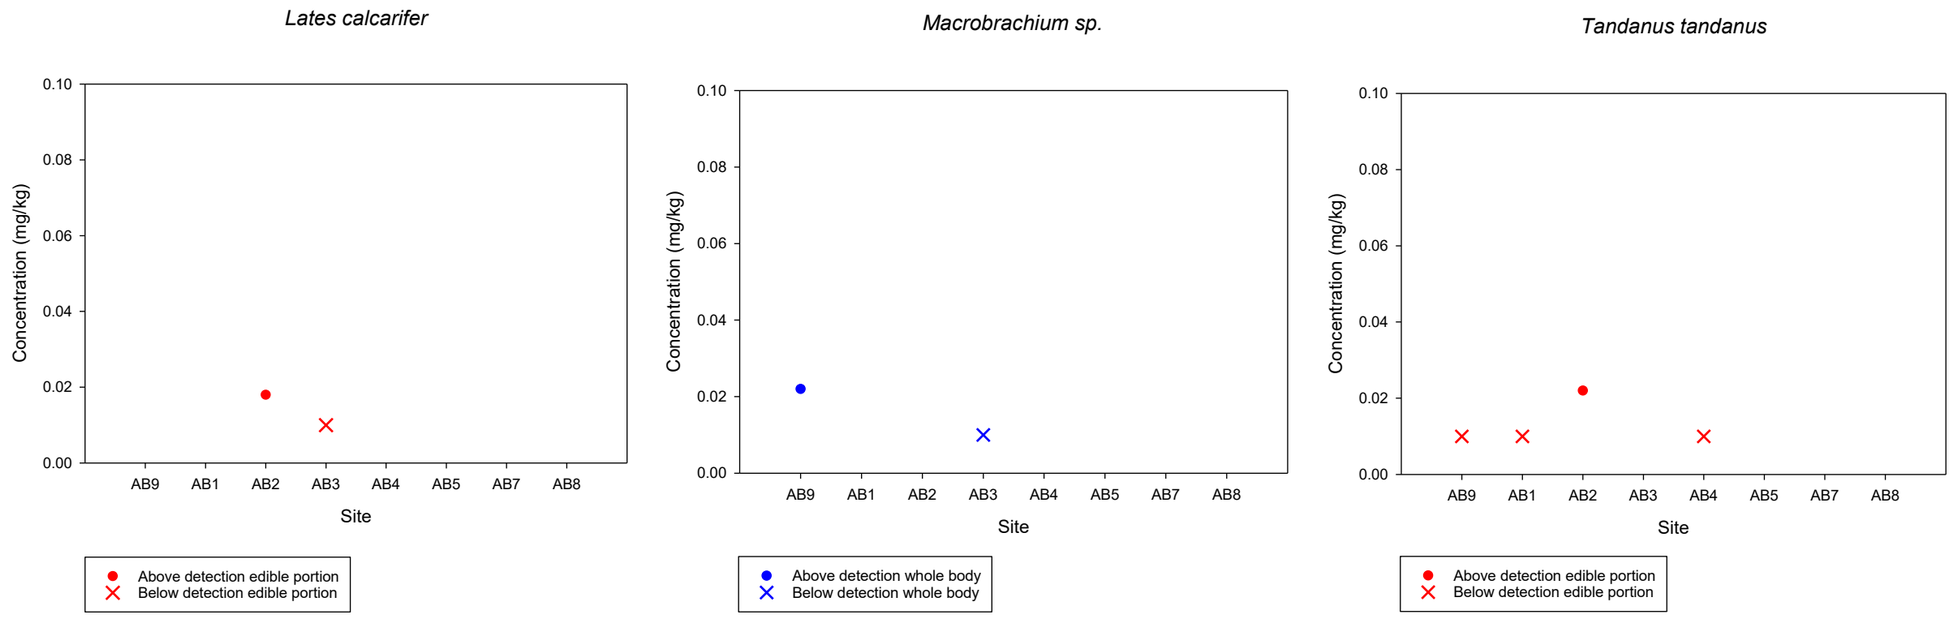

Figure 3-32 Thorium concentration in biota tissue.

FLUORIDE

There are no available guideline values for fluoride in biota tissue therefore the following represents comparative assessment only.

Fluoride was detected at just two sites; Lake Callide test site AB3 and Callide Creek test site AB8 (Figure 3-33).

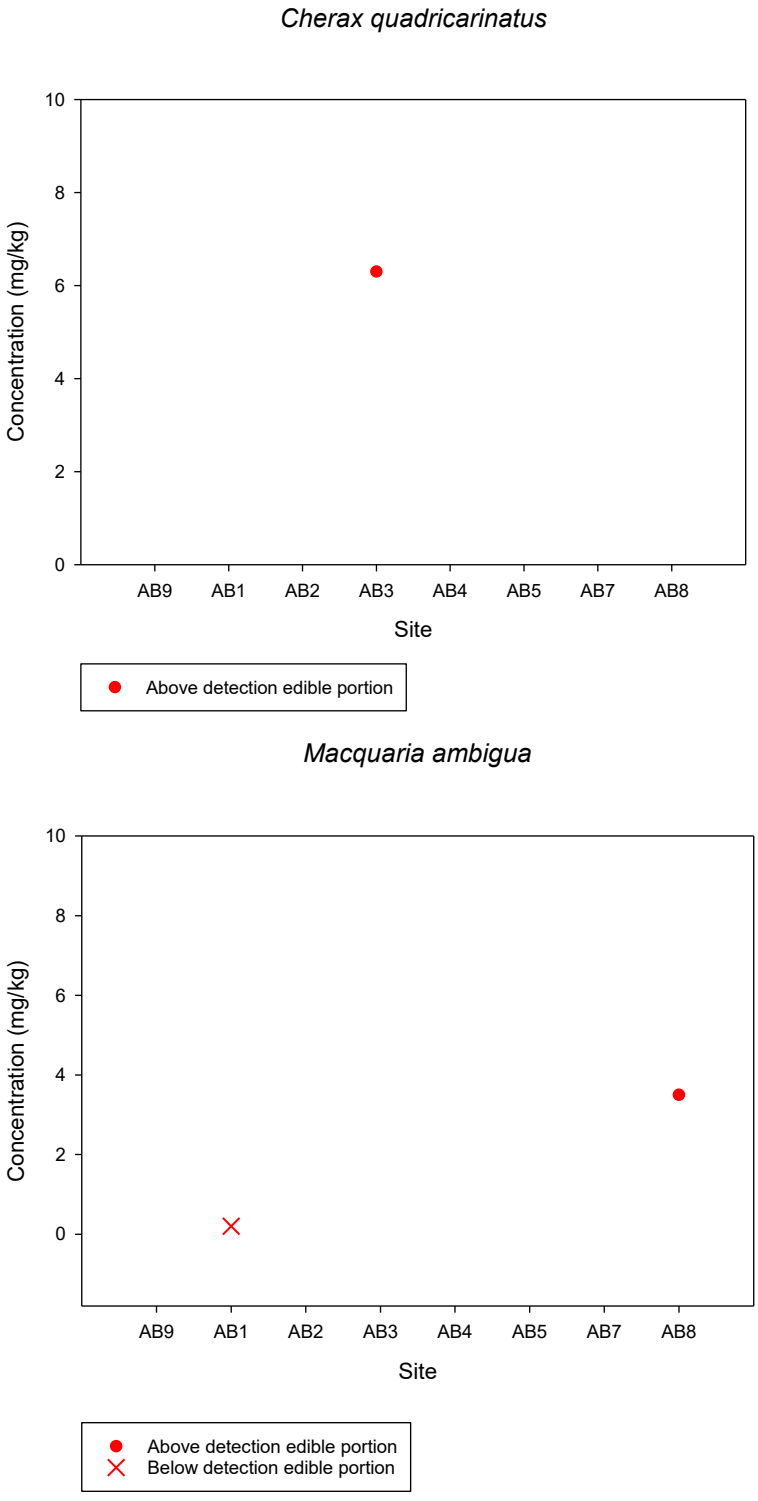

Figure 3-33 Fluoride concentration in biota tissue.

3.5.3 SUMMARY

The results of the biota tissue analysis are summarised in Table 3-8.

PFOS concentrations in biota appear increase downstream and are highest at the site furthest downstream (AB8). It should also be noted that site AB8 is downstream from the township of Biloela which may be another potential source of PFOS. PFOS was also detected in biota at the control site upstream of CP on Callide Creek (AB1).

There were no detections of PFOS within Lake Callide, which reflects surface water sampling in the lake, where PFOS was either not detected or was present at low levels. Interestingly, PFOS concentrations were relatively low at site AB4, despite being closest in positioned in proximity to the CPS, however it should be noted that this site is located just upstream of the main channel draining the CPS, potentially away from the bulk of PFOS influence.

Most of the fish species identified in the current study are potamodromus, meaning that they may migrate upstream and downstream during their lifecycle. The movement habits and subsequent degree of PFOS exposure of the fish analysed in the current study is unknown and could have potentially influenced results. Fish movement in the catchment is influenced by seasonal flow patterns and barriers to fish movement, these include the dam wall at Lake Callide and Callide Weir.

There was no obvious difference between contaminant concentrations between the edible portions and rest of body samples where these were analysed separately. This indicates that contaminants do not appear to accumulate in certain organs/body parts.

Table 3-9 Biota tissue analysis results summary.

Contaminant	Trends and observations regarding treatments	Trends and observations regarding species
PFOS	Detected at both control sites and test sites on Callide Creek with an increasing trend downstream on Callide Creek	Large-bodied predators (*M. ambigua*), large/medium predator/omnivores (*O. lineolata* and various eel-tail catfish) that may be consumed by humans. Small-bodied micropredator/omnivores (e.g *A. aggassizii*) and scavengers (Atyidae) likely consumed by higher order organisms.
Arsenic	No obvious trend	Higher concentration in macrocrustaceans
Barium	No obvious trend	Higher concentration in macrocrustaceans
Chromium	No obvious trend	No obvious trend
Molybdenum	No obvious trend	No obvious trend
Selenium	No obvious trend	No obvious trend
Vanadium	No obvious trend	Detection limited to a single eel-tail catfish in Lake Callide
Zinc	No obvious trend	No obvious trend - values above guideline levels for most species

Contaminant	Trends and observations regarding treatments	Trends and observations regarding species
Thorium	No obvious trend	No obvious trend
Fluoride	No obvious trend	Detection limited to a single large bodied predator (*M. ambigua*) and medium-bodied scavenger (*C. quadricarinatus*) that may be consumed by humans

4. CONCLUSION

The habitat condition, aquatic biota, and macroinvertebrate communities varied between control/reference sites and test sites. Upstream of Callide Dam within Callide Creek habitat condition was excellent and aquatic biota and macroinvertebrates were abundant and diverse for this system. Downstream some disturbance was evident based on the state of the habitat, water quality, and macroinvertebrate assemblages. Habitat quality overall was in good to excellent condition, with most sites limited due to lower water depth, availability of micro and macrohabitats and by high fine sediment content. Lake Callide, a larger water body with sections of sheltered habitat was able to support similar, and in some cases more diverse aquatic biota and macroinvertebrates communities than the comparable reference site Lake Kroombit. Analysis of historical water quality showed that site AB4 had high conductivity (2,631µS/cm) and that dissolved oxygen (%saturation) was relatively low across all sites, in particular downstream of Lake Callide.

PFOS was detected in biota at sites on Callide Creek both upstream and downstream of the CP with most concentrations being above human and ecological health guideline levels. No PFOS was detected in Lake Callide or within Lake Kroombit. PFOS concentrations appear to increase with increasing distance downstream of CPS, with the highest concentrations recorded at the furthest downstream site. Concentration of metals and fluoride did not show an obvious trend across treatments. Where guidelines (generally expected levels) were available, most metals/metalloids concentrations were below respective guidelines, except for zinc. However, zinc concentrations were above guideline levels regardless of species and site.

APPENDIX A. METHODS

OVERVIEW

The methods detailed below are based on those stipulated in the SAQP (Epic Environmental, 2022).

HABITAT

Habitat characteristics at sites within riverine habitats (watercourses) were recorded via the use of the Queensland AUSRIVAS River Bioassessment field sheets. Any notable site characteristics and features were recorded and accompanied by photos. A brief site summary was compiled that included notes on bed and bank stability, riparian coverage, substrate coverage, shading and macro and micro-habitat features. For riverine environments, River Bioassessment Program scores (bio-assessment scores; out of 135) were calculated for all sites based on nine AUSRIVAS categories, including: habitat availability (pool/riffle, run/bend ratio); bank stability; streamside cover; bed substrate composition and embeddedness; channel alteration; and presence of scouring and/or deposition. From these scores, an aquatic habitat condition rating was calculated and categorised into: Poor, Fair, Good or Excellent habitat conditions.

A number of surveyed sites were also located with lacustrine habitats. The AquaBAMM method used to score wetlands and riverine systems in Australia is used to assess natural and near natural wetlands and cannot be applied to Lake Callide or Kroombit Dam. Additionally, the assessment focuses on conservation significant species presence and priority species in its scoring rather than the assessment of macro and microhabitat variables and items affecting such variables (i.e. deposition, scouring, etc.). Many defined guidelines for such assessments are drafted overseas but assess similar variables to AquaBAMM. In order to maintain consistency with AUSRIVAS habitat condition assessments, AUSRIVAS Physical Assessment Protocol scores was adapted by Hydrobiology for the assessment of lacustrine habitats. As with riverine sites, all sites were scored and classified as being in poor, fair, good or excellent condition however the scores required for each of these classifications differed to those defined for riverine sites.

WATER QUALITY

DATA COLLECTION AND PROCESSING

Physiochemical parameters were not measured in-situ at the time of the survey as this method was not required by the SAQP (Epic Environmental, 2022) for biota sampling.

The latest in-situ water quality data was provided by the client for the water monitoring points closest to each survey site. Data was as recent as February 2023 but dates back to July 2022. Note that it was provided for background/general consideration.

GUIDELINE COMPARISON

Water quality data provided by the client was compared against the WQO's defined for the Callide Creek catchment (DEHP, 2011) and against ANZG/ANZEEC guideline values where relevant (ANZG, 2018).

MACROINVERTEBRATES

SAMPLE COLLECTION AND PROCESSING

Macroinvertebrate sampling was undertaken in accordance with AUSRIVAS protocols for Queensland streams (DNRM, 2001) and more recent macroinvertebrate sampling manuals (DES, 2018). In order to target macroinvertebrates occurring in different freshwater habitats and to assess varying impact processes, both kick (pool/bed habitat) and sweep (edge habitat) samples were collected from each site. Collected samples were live-picked and returned to the laboratory for identification to family and sub-family (chironomids only) level, where possible. Importantly, macroinvertebrate sampling, processing, identification and enumeration was undertaken by AUSRIVAS accredited scientists.

DATA ANALYSIS

GUIDELINE COMPARISONS

Collected macroinvertebrate data were used to calculate several diversity indices including:

- Taxonomic richness (the number of individual taxa recorded at each site);
- Total abundance (the number of macroinvertebrates at each site);
- Tolerant taxa (the percentage of tolerant taxa in represented within each sites overall assemblage);
- Plecoptera, Ephemeroptera and Trichoptera (PET) richness (the number of pollution-sensitive taxa at each site); and
- SIGNAL (the condition score calculated for each site based on present macroinvertebrates and their associated sensitivity grades).

Calculated diversity index values were compared to relevant biological quality objectives (BQO) for edge and composite (includes run, riffle, pools) habitats defined for the Callide Creek Catchment, which for all catchments in the Fitzroy basin are based on the 20:80 percentile values defined for the central coast region (EHP, 2009).

AUSRIVAS PREDICTIVE MODELLING

The macroinvertebrate and predictor variable (habitat) data were analysed using the AUSRIVAS macroinvertebrate predictive modelling program, version 3.2.2 (Coyush et al., 2000). Based on the period of sampling and the habitat in which macroinvertebrates were collected, the autumn (post-wet) edge and pool predictive models were used to provide an indication of water quality and/or habitat condition.

AUSRIVAS predictive model produces various outputs, of which the most valuable for interpretation is the observed to expected ratio (OE50) score. It provides a measure of biological impairment at each site (Coyush et al., 2000). The OE50 scores are assigned to band sections provided by the model, ranging from Band X (better than AUSRIVAS database reference condition) to Band D (extremely impaired).

FUNCTIONAL FEEDING GUILDS

Macroinvertebrates are often grouped into functional feeding guilds (FFGs) for ease of conceptualisation. FFGs classification of aquatic organisms enhances the knowledge of trophic dynamics in streams by simplifying the benthic community into FFGs. The pattern of FFG distribution has been related to the environmental gradient in the river (River Continuum Concept – Vannote et al., 1980) and can therefore provide an indication of the health of a river system (i.e. should there be changes to the expected distribution of guilds).

Functional feeding guilds were assigned to each taxa recorded in edge and bed habitat, graphed and compared visually among sites and habitats.

FISH, REPTILES AND MACROCRUSTACEANS

DATA COLLECTION AND PROCESSING

During the sampling event, a range of passive (fyke nets, pyramid and box traps) and active (electrofishing) survey methods were utilised. The aforementioned techniques are suitable and commonly used apparatus for the survey of fish (small and large bodies species) and aquatic reptiles. The below methods are also efficient methods for the capture of macrocrustaceans, and while not specifically used for this reason, were commonly caught as by-catch.

All individuals of native species not required for tissue analysis were released after identification and measurement near to where they were captured. All exotic and voucher specimens were euthanised via a lethal dose of Aqui-S® solution in accordance with Hydrobiology's Animal Ethics approval. Exotics were disposed of in accordance with current State legislative requirements.

Fish and aquatic reptile surveys were undertaken in accordance with relevant permits, including:

- Department of Agriculture and Fisheries (DAF) Animal Ethics Approval - #CA 2021/02/1462;
- General Fisheries Permit - #206951;
- Research permit issued under the provisions of the *Nature Conservation Act 1992*- # P-PTUKI-100325946; and
- Research permit issued under the provisions of the *Forestry Act 1959*- # P-PTC-100325951.

FYKE NETS

At each site with sufficient water, a large dual wing fyke and a smaller single wing fyke were deployed with entrances facing downstream where possible. The large fyke had two 5.1 m wings, a mouth 1m wide and a tunnel 3.2m long. The smaller fyke had a single 4.8 m wing, a mouth 0.6 m wide and a tunnel 3.2 m long. The mesh sizes of the large and small fyke nets were 5 and 3 mm, respectively. A float was placed in the cod end of each fyke net to provide an air space for air breathing fauna (turtles, freshwater snakes etc). Fyke nets were set either in the morning or afternoon following site habitat assessment, electrofishing and macroinvertebrate sampling and processing. Fyke nets were cleared after night deployment.

BOX TRAPS

At each site a total of five box traps were deployed around available microhabitat (i.e. around woody debris, amongst rushes, large rocks/rubble). Each trap was baited with cat biscuits. Box traps were set either in the morning or afternoon following site habitat assessment, electrofishing and macroinvertebrate sampling and processing. Box traps were cleared after night deployment.

PYRAMID TRAPS

Three pyramid traps were deployed at each site amongst suitable microhabitat (i.e. around woody debris, amongst rushes, large rocks/rubble). Traps were baited with cat food, cow organs and fruits). Pyramid traps were set either in the morning or afternoon following site habitat assessment, electrofishing and macroinvertebrate sampling and processing. Pyramid traps were cleared after night deployment.

ELECTROFISHING

Creek Sites

Backpack electrofishing was employed at creek sites in wadable areas using a Smith-root APEX backpack electrofisher fitted with a 28 cm anode ring and a tightly covered dip net (10 mm stretched mesh). Both frequency (300 Hz) and duty cycle (~50%) was fixed to maintain a constant pulse width, with voltage varying according to conductivity levels. Sampling effort aimed to be consistent across habitats, with approximately 600 seconds 'on time' at sites. Due to the conductivity of site AB11 backpack electrofishing could not be performed.

Lake Sites

Boat electrofishing was conducted at Lake Callide sites (AB2 and AB3) and at Lake Kroombit (AB9). Boat electrofishing was undertaken via the use of a 5 m boat fitted with a 5 KVA generator and Smith–Root control box. Each standard boat electrofishing shot was completed of power–on time of approximately 600 seconds (± 5%). Applied voltage varied according to the prevailing conductivity and temperature conditions. Stunned fish were blind sweep-netted from the water with a 3 mm open–mesh dip net fitted to a fibreglass pole.

VERTEBRATE PROCESSING

The following vertebrate processing methods were employed at all sites:

- Fish, macrocrustaceans, and turtles were identified to species level and enumerated;
- Carapace length was taken for each macrocrustacean collected until 20 individuals of the species were recorded for the particular site and capture method. Following this, the individuals would be counted; and
- Each fish specimen was measured for total length until 20 individuals of the species were recorded for the particular site and capture method. Following this, the individuals were counted.

DATA ANALYSIS

Total species richness and abundances was summarised for each class across all sites.

Diversity and composition of sites along the main trunk of Callide Creek were compared against fish WQO values defined by DEHP (2011) OE50 values were calculated by dividing the number of native fish species at each site by 14 to determine a ratio value. The value of 14 was defined within the WQO as the expected number of native species along Callide Creek's main trunk, and the WQO defined the OE50 ratio values as ≥1. The WQO also specified values for exotic fish species, where the number of alien fish present could not exceed 2 exotic species, with *Carassius austratus* and *Gambusia holbrooki* both previously identified with Callide Creek main trunk.

BIOTA TISSUE ANALYSIS

This study aimed to quantify levels of PFAS, metals/metalloids and fluoride in aquatic organisms relevant to the assessment of risks to human and ecological receptors. Therefore, different species/tissues were be targeted as defined by the SAQP (Epic Environmental, 2022). A range of species were considered for sampling, though the capture of target species was limited by what is caught on each sampling day. Sampling the same species at each site which provided for a more robust dataset and allowed for comparison among treatments/sites.

The following considerations were made:

- If possible, the same species were collected across sites for comparison; and
- If the primary or secondary target species were not present at sites additional species representing the same functional feeding group (i.e. predator, planktivore, omnivores, etc.) were selected.

SAMPLE SIZE AND PROCESSING

The edible portions (fillet/muscle tissue for fish or abdomen flesh for macrocrustaceans) of five or more individuals were combined and processed (composited) for each human health target species at each site where possible. The rest of the body of selected individuals from three species were processed separately to investigate any variability of contaminant concentration within different body parts. This included samples from:

- Yellowbelly (*M. ambigua*);
- Barramundi (*L. calcarifer*); and
- Crayfish (*C. quadricarinatus*).

The whole bodies of 5 or more individual ecological health target species were combined and processed (composited) at each site where possible.

All dissection, compositing and homogenisation of biota samples were conducted at the primary laboratory to reduce potential contamination in the field.

LABORATORY METHODOLOGIES

Australian Laboratory Services (ALS) was selected as the primary laboratory to perform sample analysis and Eurofins Environmental Testing Australia Pty Ltd (Eurofins) were selected to conduct triplicate analysis. National Measurement Institute (NMI) were selected to conduct additional analysis for lithium, thorium and total fluoride on each sample and for these analyses represent the primary laboratory.

The analytical procedures used by the laboratories selected are in accordance with established internationally recognised procedures such as those published by the United States Environmental Protection Agency (USEPA), American Public Health Association (APHA) and relevant Australian Standards/New Zealand Standards (AS/NZS).

The following PFAS constituents were analysed:

- Perfluorobutane sulfonic acid <0.02(PFBS)
- Perfluoropentane sulfonic acid (PFPeS)
- Perfluorohexane sulfonic acid (PFHxS)
- Perfluoroheptane sulfonic acid (PFHpS)
- Perfluorooctane sulfonic acid (PFOS, both linear and branched)
- Perfluorodecane sulfonic acid (PFDS)
- Perfluorobutanoic acid (PFBA)
- Perfluoropentanoic acid (PFPeA)
- Perfluorohexanoic acid (PFHxA)
- Perfluoroheptanoic acid (PFHpA)
- Perfluorooctanoic acid (PFOA)
- Perfluorononanoic acid (PFNA)
- Perfluorodecanoic acid (PFDA)
- Perfluoroundecanoic acid (PFUnDA)
- Perfluorododecanoic acid (PFDoDA)
- Perfluorotridecanoic acid (PFTrDA)
- Perfluorotetradecanoic acid (PFTeDA)
- Perfluorooctane sulfonamide (FOSA)

- N-Methyl perfluorooctane sulfonamide (MeFOSA)
- N-Ethyl perfluorooctane sulfonamide (EtFOSA)
- N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)
- N-Ethyl perfluorooctane sulfonamidoethanol (EtFOSE)
- N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)
- N-Ethyl perfluorooctane sulfonamidoacetic acid (EtFOSAA)
- 4:2 Fluorotelomer sulfonic acid (4:2 FTS)
- 6:2 Fluorotelomer sulfonic acid (6:2 FTS)
- 8:2 Fluorotelomer sulfonic acid (8:2 FTS)
- 10:2 Fluorotelomer sulfonic acid (10:2 FTS)

The primary laboratory (ALS) analysed for the following total metals/metalloids:

- Arsenic
- Barium
- Chromium
- Copper
- Molybdenum
- Selenium
- Strontium
- Uranium
- Vanadium
- Zinc
- Boron

Additional metals analysis was requested that could not be completed by the primary laboratory, these being total lithium and total thorium. A sub-sample was therefore provided to the secondary laboratory (NMI) for this analysis where sample volume was sufficient. Sub-samples were prepared and distributed by ALS.

Sub-samples of each sample were provided to the secondary laboratory (NMI) for analysis of total fluoride where sample volume was sufficient. Sub-samples were prepared and distributed by ALS.

QA/QC

Primary samples consisted of tissue removed from multiple individuals (5-10) that were combined and homogenised. A sub-sample was taken from selected (homogenised) samples to provide duplicate and triplicate QA/QC samples. Duplicate and triplicate samples were collected at a rate of one duplicate and one triplicate every ten primary samples. Duplicate samples were analysed by the primary laboratory (ALS) and triplicate samples were analysed by Eurofins. The primary samples and their respective duplicate/triplicate samples are displayed in Table 5-1.

Table 5-1 Primary samples and their respective duplicate/triplicate samples.

Primary sample	Duplicate	Triplicate
AB2-LC-EP	AB2-BC-DU	-
AB3-CS-WB	AB3-CS-DU	-

Primary sample	Duplicate	Triplicate
AB9-NH-EP	AB9-NH-DU	-
AB1-MA-EP	AB1-MA-DU	AB1-MA-TR
AB1-NH-EP	-	AB1-NH-TR

Rinsate water samples were collected each day by rinsing down sampling equipment to check for potential contamination. Each rinsate sample contained water collected from rinsing the measuring board used to measure and weigh each fish/crustacean. Additionally, a sample of dilute Aqui-S was collected and analysed to check if the anaesthetic was a potential source of contaminants. Laboratory QA/QA measures included method blanks, control samples and method spikes. The results of the QA/QC analysis are detailed in (Appendix B).

SCREENING CRITERIA

Human Health

The PFAS National Environmental Management Plan (NEMP, 2020) provides Australian guidance on food consumption screening criteria for PFAS levels relevant to human health. It should be noted that that the food consumption guideline values were based on FSANZ trigger values that consider 100% of total dietary intake (TDI) (NEMP, 2020 Table 5-2). As such, when considering the consumption of seafood only, they may not be protective for people exposed to PFAS from other unaccounted potential pathways. Additional TDI values were then calculated for an average weigh male (70kg) as defined in national guidelines for assessing human health risks from environmental hazards (enHEALTH, 2012). These values were then compared to the levels of PFAS in biota collected in the current study and are displayed in the associated graphs.

Table 5-2 Summary of human health screening criteria, extracted from NEMP (2020)

Exposure scenario	Unit	PFOS + PFHxS	PFOA	Note
Tolerable daily intake (TDI)	µg/kg$_{BW}$/day*	0.02	0.16	These criteria are based on 100 % of total dietary intake (TDI) and may not be protective for people exposed to PFAS from other potential pathways.
Calculated TDI for average 70kg adult (µg/day)	µg/day	1.4	11.2	

* BW stands for body weight

Ecological

All ecological screening values for the protection against bioaccumulation and secondary poisoning available from NEMP (2020) are summarised in Table 5-3.

Table 5-3 Summary of ecological screening criteria, extracted from NEMP (2020).

Exposure scenario	PFOS	PFOA	Note
Mammalian diet (biota ww food)	4.6 µg/kg	Not available	Based on Canadian guidelines for screening of biota (e.g. fish tissue) samples consumed by mammals and/or birds. The value refers to the concentration of PFOS in the aquatic biota food item. It should be noted that data is not based on relevant species; e.g. wetland birds in Australia may have higher risk based on size and consumption rates.
Avian diet (biota ww food)	8.2 µg/kg	Not available	

GENERALLY EXPECTED LEVELS

Results were compared to historical data and against Generally Expected Levels (GELs) for metals/metalloids in fish and crustaceans according to ANZFA (2001) guidelines. GELs provide a benchmark against which to measure contaminant levels in food. The GELs used in the current study are displayed in Table 5-4.

Table 5-4 GELs used in the current study. Units in mg/kg.

Metal	Crustacean GEL	Fish GEL
Copper	20	2
Selenium	1	2
Zinc	40	15

APPENDIX B. QA/QC

OVERVIEW

Sampling and analysis was conducted by appropriately qualified samplers (including fisheries biologists, aquatic ecologists and contamination scientist with over 70 years of collective experience) following methods consistent with national and state guidelines. Sampling of biota for PFAS followed guidelines specific for the collection of seafood (i.e., fish and crustacean) samples for human health risk assessment (Queensland Health, n.d). This includes measures such as:

- Appropriate species selection;
- Differentiating edible portions specific for human consumption;
- Obtaining sufficient sample sizes;
- Minimising contamination in the field by avoiding materials containing PFAS (e.g. clothing, containers, etc.);
- Conducting sample preparation in a laboratory;
- Chilling/freezing samples promptly after collection; and
- Following a defined SAQP.

DUPLICATES

Duplicate samples (collected at a rate of one every ten samples) were collected to assess the precision and repeatability of the primary laboratory. Relative percent differences (RPD) were used to qualify quality control efforts. The duplicates were analysed by the primary laboratory provider (ALS).

The results of the duplicate analysis indicate that all RPDs apart from strontium were below the measurement quality objective (MQO) of ≤50% (Table 5-5). This indicates that there may be decreased precision of the strontium data analysis provided in this report.

`

Table 5-5 Duplicate tissue analysis QA/QC results. Shaded cells represent RPD >50%.

TRIPLICATES

Triplicate samples (collected at a rate of one every ten primary samples) were collected to assess any lab biases. Relative percent differences (RPD) were used to qualify quality control efforts. The triplicates were analysed by Eurofins.

The results of the triplicates analysis indicate that all RPDs were below the measurement quality objective (MQO) of ≤50% (Table 5-6).

METHOD BLANK

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination.

All analytes in the method blank samples were below detection indicating that there was no laboratory contamination.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix.

All laboratory control samples were within acceptable limits (70-130% recovery).

MATRIX SPIKES

A matrix spike refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries.

All matrix spike recoveries were within the acceptable limits (70-130%).

RINSATES

All analytes were below detectable levels within rinsate samples and within the dilute Aqui-s sample, indicating no contamination from sampling equipment or chemicals used in fish anesthetisation (Table 5-7).

Table 5-7 Rinsate and dilute Aqui-s QA/QC analysis results.

Analyte	Units	LOR	Rinsate 1 (30/01/2023)	Rinsate 2 (31/01/2023)	Rinsate 3 (1/02/2023)	Rinsate 4 (2/02/2023)	Rinsate 5 (3/02/2023)	Dilute Aqui-s

Right Bank	
Width (m)	5
Bare (%)	10
Grasses (%)	50
Shrubs (%)	10
Trees <10 m high (%)	0
Trees >10 m high (%)	0
Exotics (%)	30

Longitudinal Extent of Riparian Vegetation

Category	Description	Category	Description
None	No trees or shrubs, only exotic grasses or pasture	Occasional clumps	Clumps of tree among exotic grasses and pastures
Isolated/scattered	Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	Cleared patches of trees
Regularly space	Evenly spaced trees among exotic grasses and pastures	Contiguous	Intact tree line

Comments

cleared, v. little habitat, Boulders, sticks & filamentous algae providing some habitat. Algal scum on shore → elevated nutrients?

None	No trees or shrubs, only exotic grasses or pasture	Occasional clumps	Clumps of tree among exotic grasses and pastures
Isolated/scattered	Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	Cleared patches of trees
Regularly space	Evenly spaced trees among exotic grasses and pastures	Contiguous	Intact tree line

Comments

Same as previous side. Lots of decaying algae from water level drop. Dense macrophytes + filamentous algae along edge. Create other habitat diversity. Some dead trees (LWD).

Regularly space	Evenly spaced trees among exotic grasses and pastures	Contiguous	Intact tree line

Comments

Site just D/S from weir. V. dense + diverse macrophytes with filamentous algae covering most of water. Left bank riparian relatively intact w/ gums, Casuarina + callistemon. Right bank semi-cleared for access. Moderate habitat diversity → Undercut banks and some LWD. Fish observed gathering at weir wall.

Comments

Impoundment (at 1% capacity). Turtle haven. Habitat provided by boulders/cobbles at edges. Boggy in deeper areas. Lots of Persicaria but is setting above water level.

Isolated/scattered	 Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	 Cleared patches of trees
Regularly space	 Evenly spaced trees among exotic grasses and pastures	Contiguous	 Intact tree line

Comments

Essentially a wetland dominated by typha on edge + ceratophyllum / submerged. Water + sediment with anoxic sulphuric smell, substrate rocky with thick layer of organic matter and blanketed with dark silt. Electrofishing not so effective despite 5 Amps → vegetation may be absorbing.

Isolated/scattered	 Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	 Cleared patches of trees
Regularly space	 Evenly spaced trees among exotic grasses and pastures	Contiguous	 Intact tree line

Comments

Riparian clearing associated with road crossing (D/S) + bridge crossing (D/S). Site highly overgrown with exotics choking most of channel (Paragrass + gamba (?) grass (see photo)). Water + sediment anoxic smell + lots of decaying veg. No access for boat + little for e-fishing / bykes. Habitat heavily low + lack of open water for large fish. Some macrophytes present (mostly Typha)

Isolated/scattered	 Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	 Cleared patches of trees
Regularly space	 Evenly spaced trees among exotic grasses and pastures	Contiguous	 Intact tree line

Comments

Highly overgrown with paragrass in channel and around pools. Some slow observed upstream. P/S composed of large pools choked with macrophytes (mainly Ceratophyllum + algae). Anoxic smell from water + sediment. Density of vegetation reduced egress/access + E-W flushing. Higher habitat diversity compared to other sites → [WD, undercut banks + root masses

Isolated/scattered	Isolated trees or shrubs among exotic grasses or pasture	Semi-contiguous	Cleared patches of trees
Regularly space	Evenly spaced trees among exotic grasses and pastures	Contiguous	Intact tree line

Comments

Intact reach, varied habitat, rocky substrate, highly armoured. Undercut banks, LWD, exposed bedrock on banks. Visible periphyton, edge habitat includes standing veg + macrophytes but not much debris → water level recently changed. Visible high fish activity. High O_2. Hygrorhiza starting to colonise (bright green)

APPENDIX F. LABORATORY REPORTS

Hydrobiology QLD Pty Ltd
Unit 27/43 Lang Parade
Auchenflower
QLD 4066

NATA Accredited
Accreditation Number 1261
Site Number 20794

Accredited for compliance with ISO/IEC 17025 – Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Attention: **Josh Hatton**

Report **968084-S**
Project name
Project ID B22096
Received Date Feb 24, 2023

Client Sample ID			**ES2304523-036**
Sample Matrix			**Solid**

Sum of PFASs (n=30)*	50	ug/kg	< 50

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Heavy Metals	Melbourne	Apr 03, 2023	28 Days
- Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS			
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Brisbane	Mar 01, 2023	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonamido substances	Brisbane	Mar 01, 2023	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonic acids (PFSAs)	Brisbane	Mar 01, 2023	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
n:2 Fluorotelomer sulfonic acids (n:2 FTSAs)	Brisbane	Mar 01, 2023	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	N/A
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG094: Insufficient sample for analysis for samples ES2304523-#012, #021, #025, #026, #027, #028, #29, #38 and #051.
- EP231X (Biota): ALS NATA accreditation for PFAS in Biota covers all Perfluoroalkyl Sulfonic Acids, Perfluoroalkyl Carboxylic Acids and (n:2) Fluorotelomer Sulfonic Acids in fish (whole and muscle), plants and vegetable matrices, with the exception PFBA (fish only), EtFOSA, MeFOSE, EtFOSE, MeFOSAA, EtFOSAA.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples received	: 6		
No. of samples analysed	: 6		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Disclaimer:

Fender Geophysics guarantees to perform a professional survey using high performance Electrical Resistivity Imaging (ERI) equipment in accordance with best industry practice and guidelines.

However due to the inherent limitations of the electrical resistivity method and the interpretive nature of the results we cannot guarantee 100% detection and accurate representation of subsurface features.

For these reasons, Fender Geophysics does not accept any responsibility or liability for losses or damages of any kind, resulting from undetected, misinterpreted or misrepresented features.

For information about the capabilities and limitations of geophysical survey equipment and case studies, please refer to our website (https://fendergeophysics.com.au).

1.0 INTRODUCTION

This report describes the project brief, logistics, and results of a dipole-dipole electrical resistivity imaging (ERI) survey undertaken for CS Energy between 08/08/2022 and 20/08/2022. CS Energy's Callide Power Station is a coal powered electricity generator located approximately 10km northeast of Biloela and 90km southwest of Gladstone in central QLD (Figure 1). The focus of this project was to identify sources of groundwater and dam seepage at the Callide Power Station Ash Dam B at Biloela, Queensland. Identification of potential drilling locations is provided based on the results of the geophysical survey. Accurate mapping of dam seepage locations and a future drilling program will be used to assist with site remediation. Site remediation will consist of managing contaminants within the dam seepage area and assessing its relationship to local sources of groundwater.

The client was especially interested in groundwater in fractured rock aquifers. The current deepest bores are in the order of 40-50m deep and the client required 100% coverage at these depths. The proposed survey consisted of 41 ERI profiles for the purpose of identifying locations of dam seepage and groundwater sources (Figure 2). The locations of the profiles were:

1. Along the southern margin of the dam (approximately 1.4km)
2. Along the southern margin the property adjacent to Biloela Callide Road including southern seep near MW9 (approximately 2.2km)
3. Along the western margin of the dam (2.5km)
4. In the vicinity of the Western Stormwater Diversion Channel (approximately 0.6km)

Two resistivity profiles were planned specifically to investigate potential groundwater presence in fractured rock strata and identify drilling targets:

1. A profile connecting bores MW32 and MW33 (approximately 0.3km)
2. A profile connecting bores MW31 and MW43 (approximately 0.6km)

The resistivity response of the subsurface is complex and is a result of rock mineralogy, weathering/fracturing, presence of water and salts, and the composition of the soil and alluvium (i.e. clays are known to be good conductors whereas quartz is strongly resistive). Where possible the resistivity data has been ground truthed from borehole data on the Callide Power Station site. Nine locations for possible bores to aid site remediation have been identified.

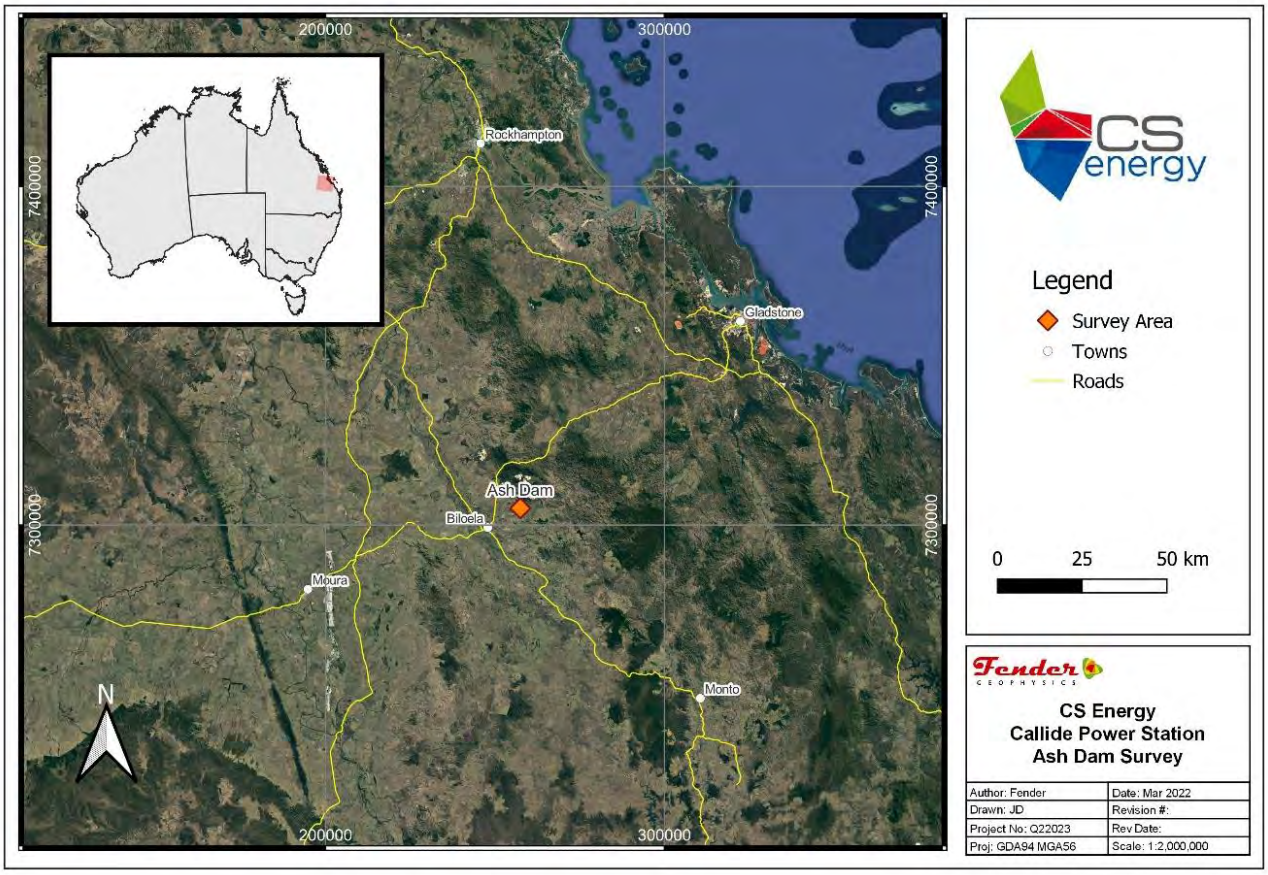

Figure 1. Location of CS Energy power station and ash dam near Biloela, QLD

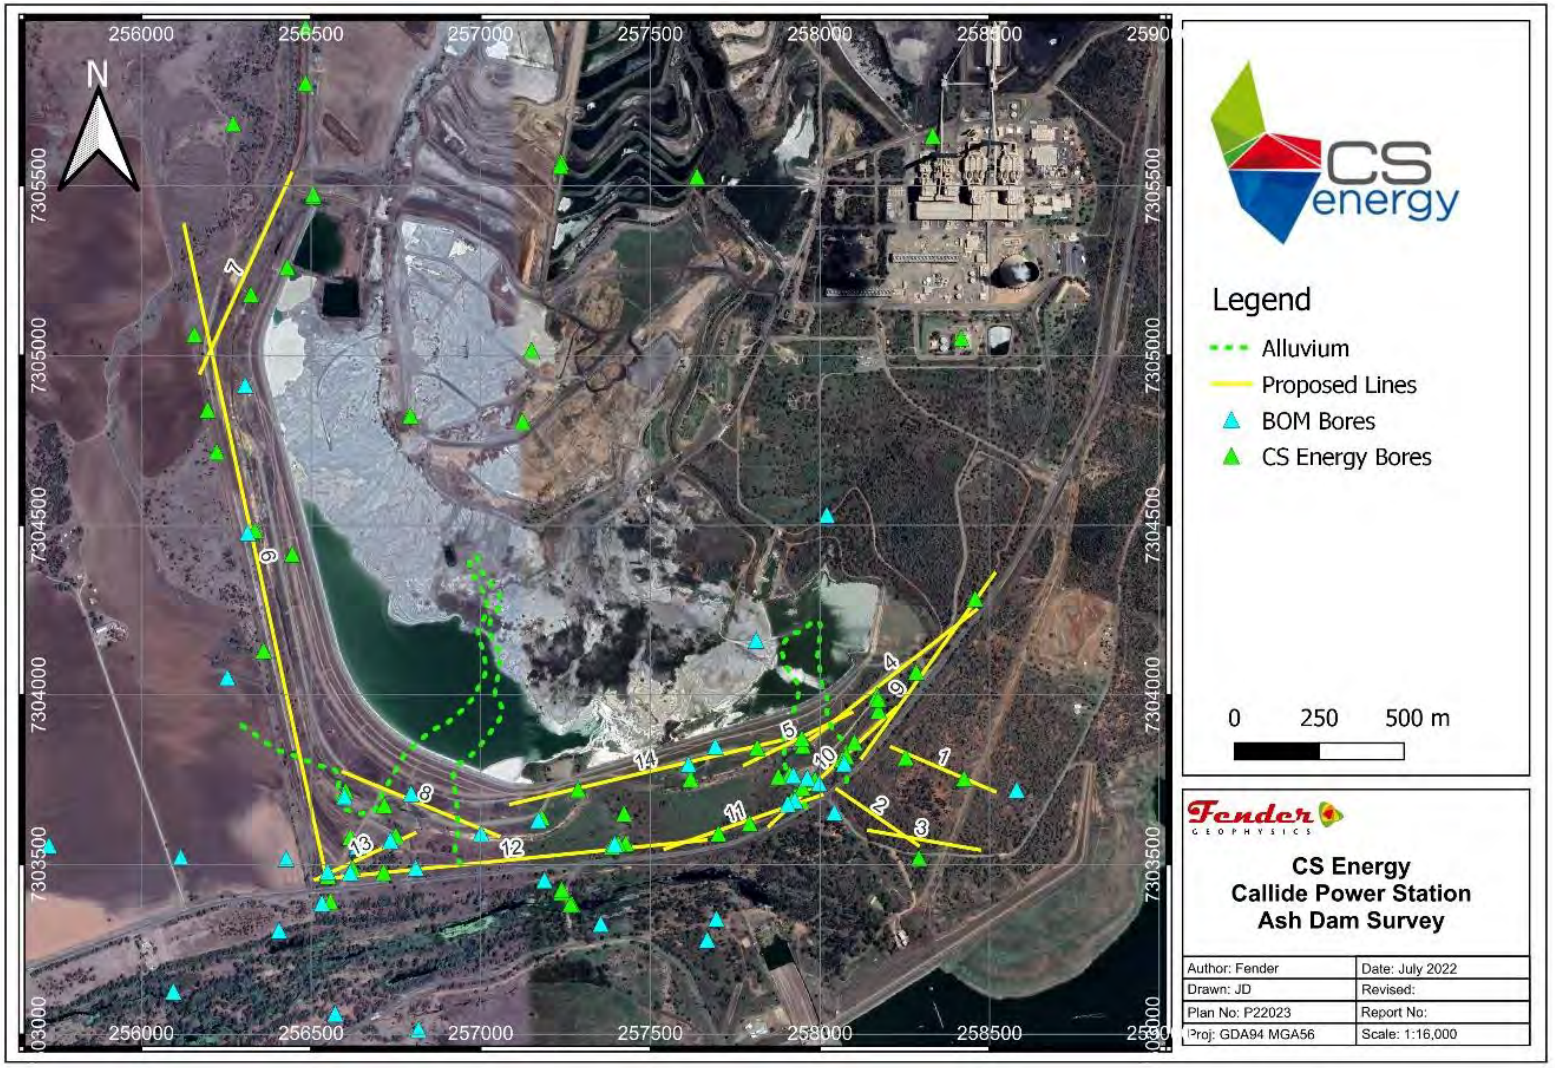

Figure 2. Proposed survey lines for the Callide Dam survey. Existing Bureau of Meteorology (BOM) and CS Energy bores are also shown.

2.0 WORKPLACE HEALTH AND SAFETY

Fender carried out a generalised risk assessment for the project prior to mobilisation which was updated following a review at site. Fender staff also attended a CS Energy safety induction prior to starting work. Safety meetings were held each day to review and discuss any issues observed or expected, and a brief safety discussion was held each morning.

Fender Geophysics staff undertook daily vehicle pre-start safety checks and weekly staff safety meeting. Results from these meetings were submitted to Fender management using the Assignar reporting app.

There were no unique hazards associated with the survey area. Snake bites were considered one of the most likely hazards to be encountered. Long grass was avoided where possible to minimise this risk and survey profiles were located on well-established tracks where possible (Figure 3). Tall grass was cleared by CS Energy staff where possible for ease of access and safety.

Slips, trip, and falls were also considered a serious hazard. Moving most survey lines on to well established tracks also reduced this risk.

Wet track and possible bogging of vehicles was considered a noteworthy risk due to significant rain on the site over the previous week. Established roads posed minimal risk, however, fire trails around the perimeter of the ash dam were clay-rich and ‘soft’. These fire trails were targeted for surveying and were safe to access during the survey despite recent rain.

Although few other vehicles were encountered during the survey, bollards were provided to limit access by vehicles when data was being acquired.

No safety incidents of any kind occurred during the survey.

Figure 3. Example of 'tall grass' with adjacent road. Roadsides were preferentially surveyed where possible. The Ash Dam B is visible to the right of the image looking west towards the Western Seepage Pond,

2.1 Personnel And Equipment

The following personnel were involved with the project:

Client (CS Energy)	Sally Bulten (Environment and Stakeholder Business Partner)
Director/Geophysicist	Andrew Sloot
Project/Survey Manager	James Daniell
Geophysicist	Sam Rubino
Technician	Iain Richardson

Table 1. P22023 Survey Personnel

The following equipment was supplied by Fender for this project:

Item	Model
Resistivity	ZZ Universal 64 channel system
Cables	2x32 channel cables with 5m takeouts
GPS	Handheld Garmin supported by mobile GPS
Data Processing Laptop	Dell Inspiron 15
Mine Spec 4wd	Hilux
Customary survey support equipment including toolbox, first aid kits etc.	

Table 2. P22023 survey equipment

3.0 SURVEY PROCEDURE AND SPECIFICATIONS

3.1 Survey Area

The Callide Power Station Ash Dam B extends approximately 2km north/south, 1.5km east/west, and up to 20-25m above the surrounding land survey (Figure 3). The site was largely grass covered with significant tree and vegetation cover in small, discrete patches. The grass was generally 'long'. The long grass was considered a likely habitat for snakes and obscured numerous drains, pits, and trenches. For safety reasons the long grass was largely avoided during the survey. There were numerous small bodies of water on the site (Figure 4).

Overall site access was excellent. Most of the proposed survey lines were accessed by established roads or fire trails.

The Callide power Station Ash Dam B site is largely underlain by the Lochenbar Formation which is predominantly comprised of Andesitic rocks (Figure 5). The Lochenbar Formation is overlain by Tertiary sediments in the southwest portion of the site and grades into Quaternary alluvium floodplain clays, silts, sands, and gravels associated with Callide Creek. Bedrock elevations derived from geology maps provided from CS Energy show the presence of two 'lows' the correlate with mapped alluvial the south-west and south of the dam (Figure 6).

The Lochenbar Formation is highly fractured beneath the site, with a potential fault running north-south in line with the Callide Dam spillway. Dioritic dykes, likely associated with the faulting have been found running co-linear with the suspected fault.

The principal aquifers identified in the study area comprise:

1. Tertiary and Quaternary alluvial sediments
2. Weathered/fractured bedrock of the Lochenbar Formation

Figure 4 Western Seepage Pond adjacent to the ash dam.

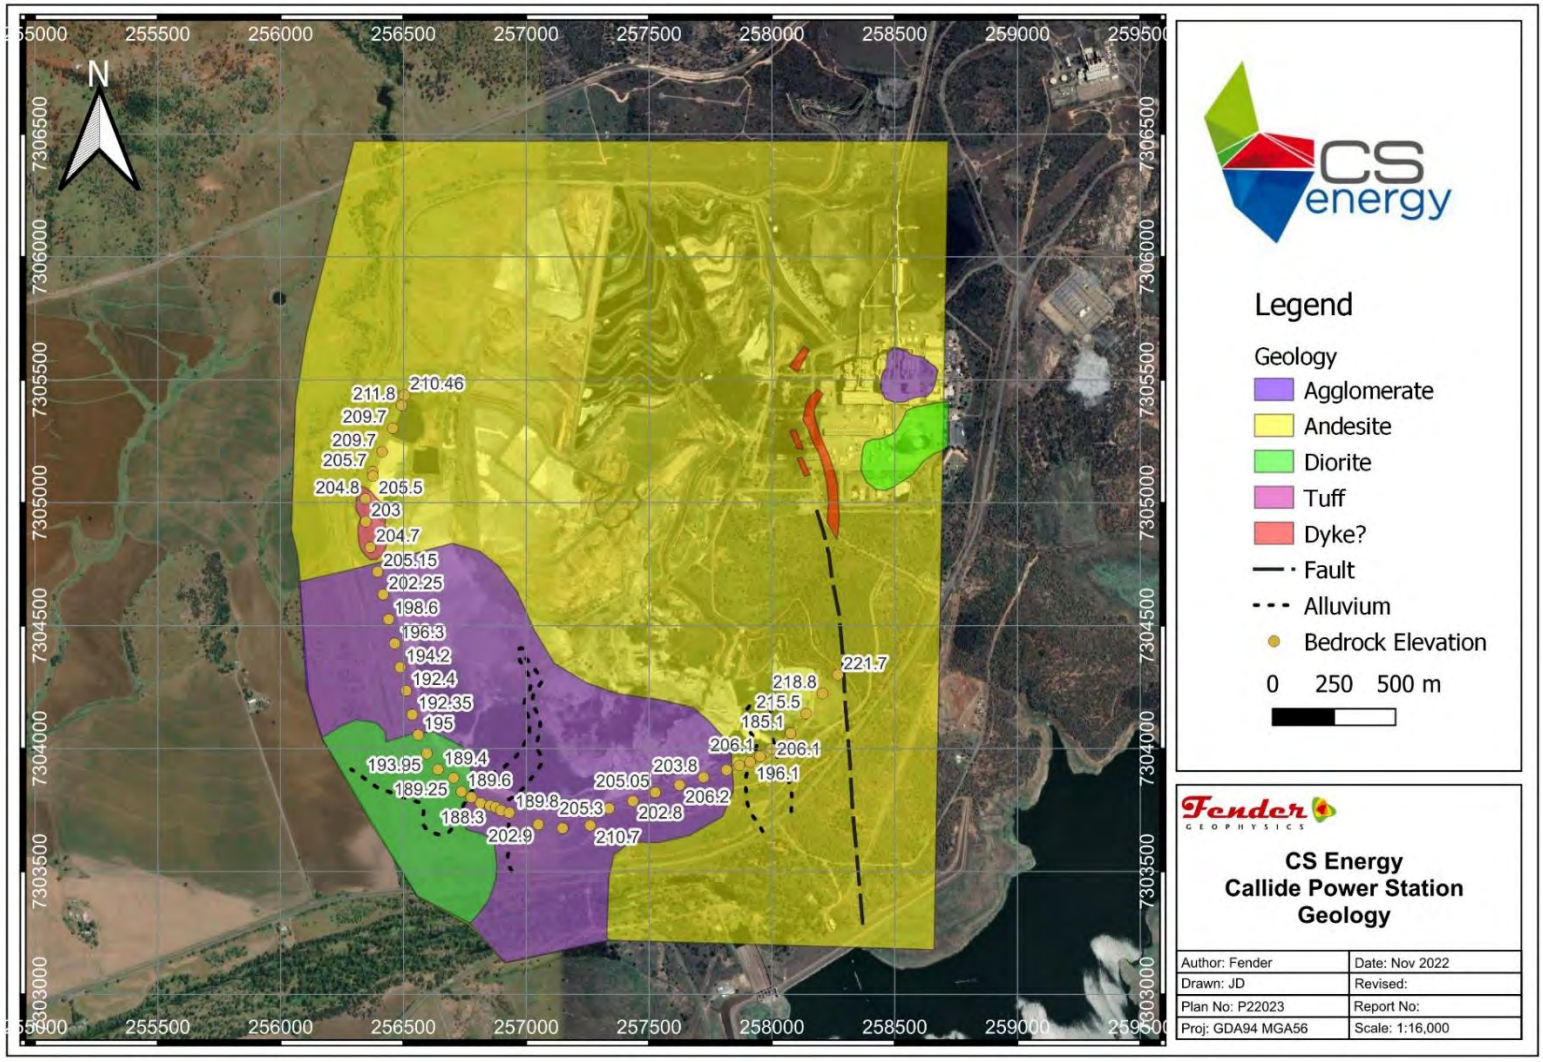

Figure 5. Geology of the Callide Ash Dam B site. Depth to bedrock measurements from bores around the perimeter of the dam are shown

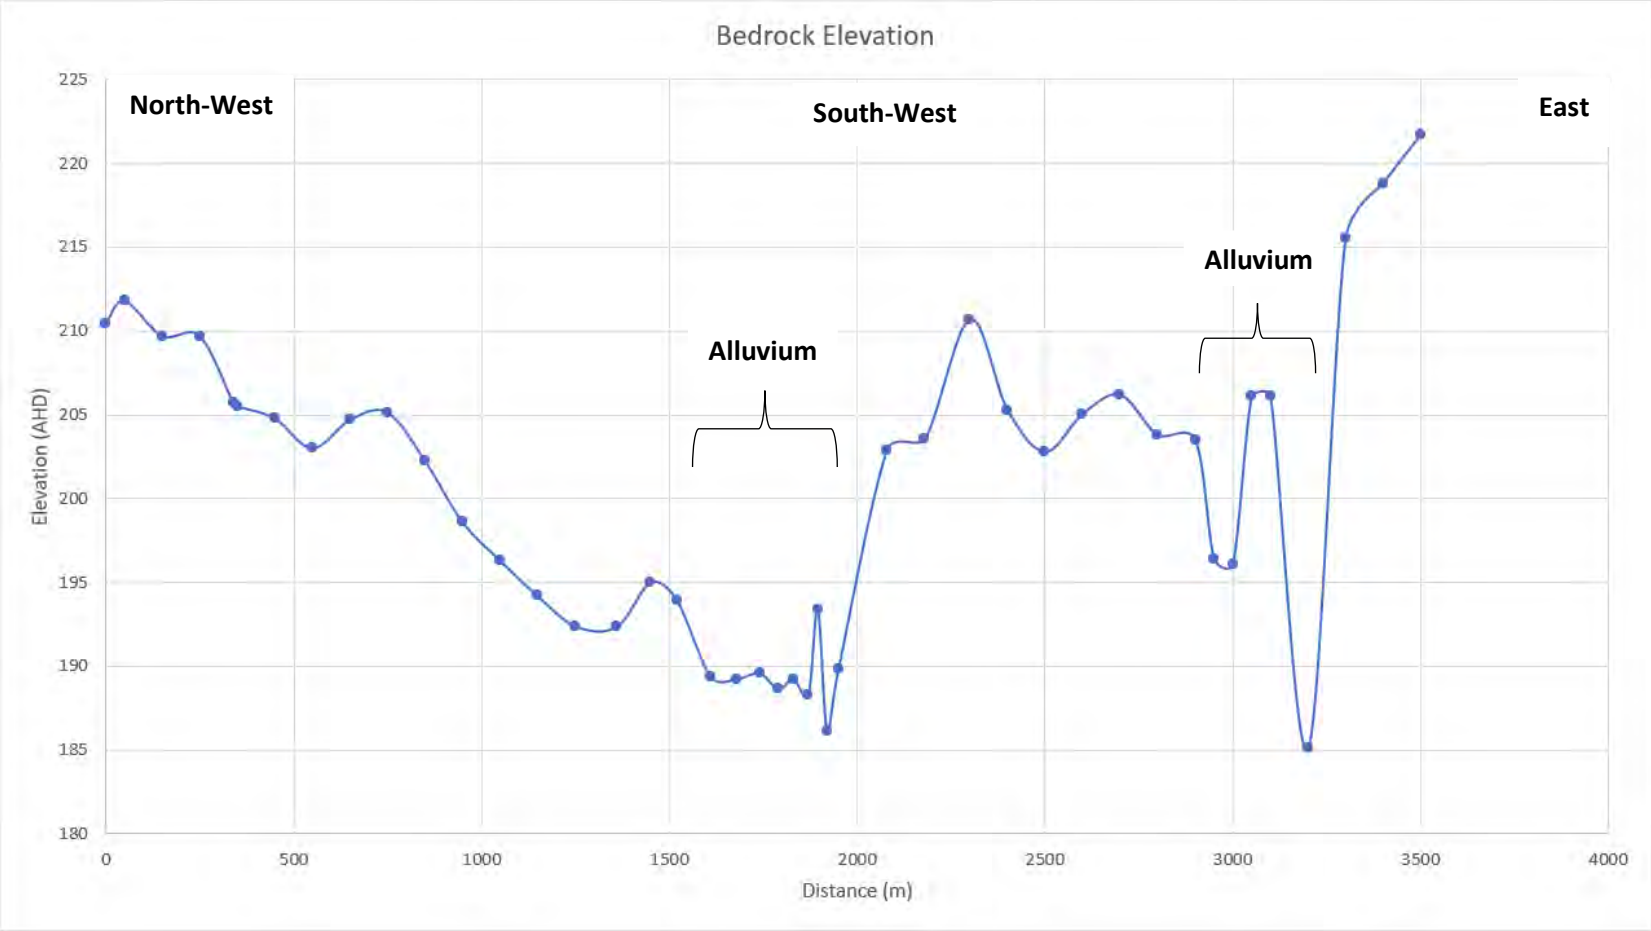

Figure 6. Bedrock elevations from dam perimeter (locations on Figure 5)

3.2 Resistivity Data Acquisition

The resistivity method is one of the oldest and most frequently used geophysical survey techniques. By taking measurements on the ground surface, electrical surveys aim to ascertain the subsurface resistivity distribution. The true resistivity of the subsoil can be calculated from these observations. The porosity, degree of water saturation in the rock, mineral and fluid content, as well as other geological factors, are all related to the ground resistivity (Figure 7). For many years, hydrogeological, mining, geotechnical, environmental, and even petroleum exploration have all used electrical resistivity studies for subsurface mapping and exploration.

The fundamental physical law used in resistivity surveys is Ohm's Law that governs the flow of current in the ground. The equation for Ohm's Law for current flow in a continuous medium is given by:

$$V = IR$$

where R is the conductivity of the medium, I is the electrical current and V is the applied voltage. We note that in geophysical surveys the measured resistivity is equal to the reciprocal of the conductivity.

The basic setup for a resistivity survey involves using a resistivity meter and four electrodes, however, modern resistivity systems are 'multi-channel' and automate the acquisition of resistivity values throughout an 'array' of electrodes. The resistivity meter is a device that acts as both a voltmeter (measuring V) and an ammeter (measuring I) and records resistance values (V/I). These resistance values are converted to apparent resistivity values using the formula:

$$\rho_a = \frac{\kappa V}{I}$$

where ρ_a = apparent resistivity and k = geometric factor. The geometric factor varies based on the geometry of each electrode spacing setup. In typical field work, data is acquired as an apparent resistivity. The apparent resistivity value is not the true resistivity of the subsurface, but an "apparent" value that is the resistivity of a homogeneous ground that will give the same resistance value for the same electrode arrangement. The relationship between the "apparent" resistivity and the "true" resistivity is a complex relationship. To determine the true subsurface resistivity from the apparent resistivity values is an "inversion" modelling problem.

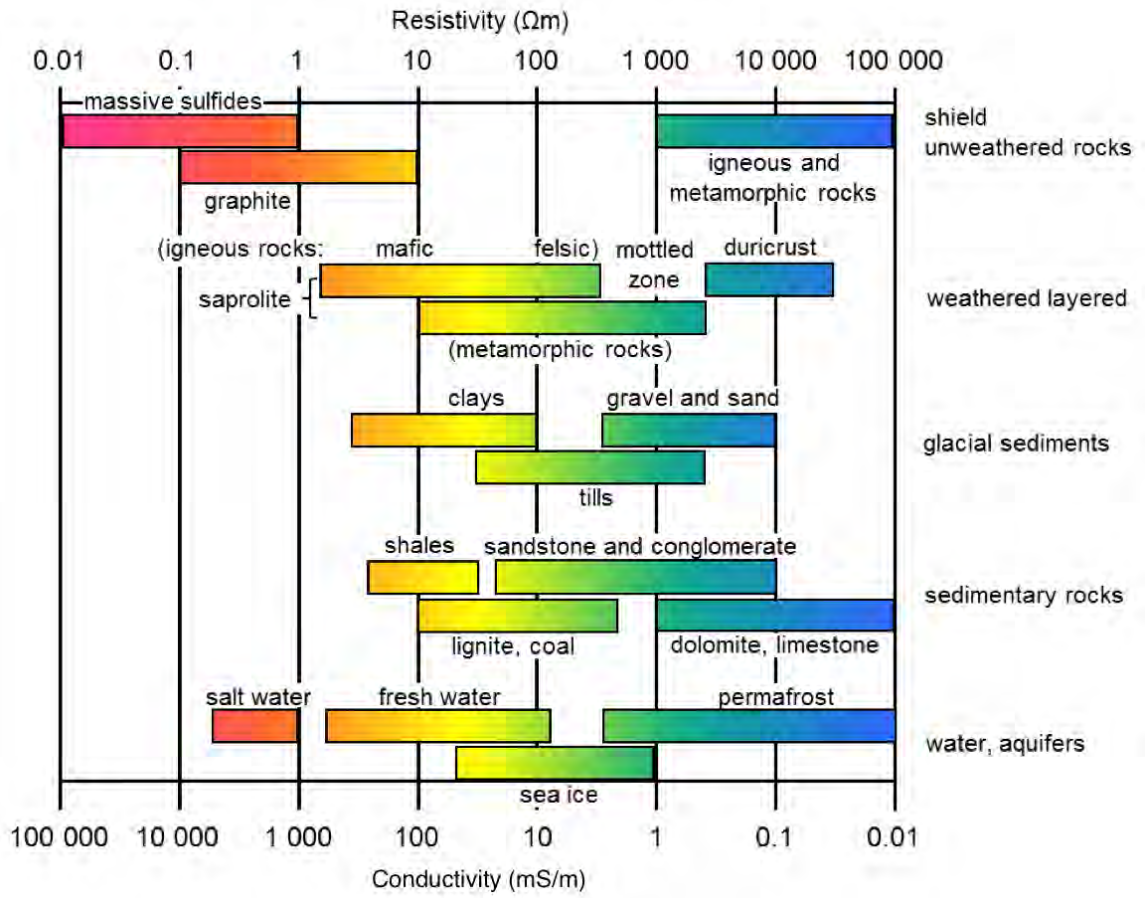

Figure 7. Generalised resistivity of rocks, soils, and aquifers.

Fender Geophysics use the Res2Dinv software for the inversion of 2-D resistivity data. The 2-D model used by the inversion program consists of a large number of rectangular blocks that are loosely tied to the distribution of the data points in the acquired resistivity data. The distribution and size of the blocks are automatically generated by the program using the distribution of the data points as a rough guide. The depth of the bottom row of blocks is set to be approximately equal to the median depth of investigation of the data points with the largest electrode spacing (i.e., the electrodes that are imaging to the deepest depths).

Starting from an initial model (usually a homogenous earth model), the program calculates the change in the model parameters that will reduce the difference between a calculated resistivity model and measured apparent resistivity values. The inversion adjusts the resistivity of the model blocks subject to the smoothness constraints that have been selected. A measure of this difference is given by the root-mean-squared (RMS) error. However, the model with the lowest possible RMS error sometimes show large and unrealistic variations in the model resistivity values and might not always be the "best" model from a geological perspective. In general, the most prudent approach

is to choose the model at the iteration after which the RMS error does not change significantly. This usually occurs between the 3rd and 6th iterations.

Multichannel resistivity profilers acquire data with a triangular-shaped cross section. Data is acquired to a maximum depth in the center of the profile, while the data is shallow towards the start and end of the profile. A 50% roll along survey involved moving the resistivity profile ½ of the array length before acquiring more data. The 50% roll along ensure that there is 100% data coverage at ½ the maximum depth of the survey. However, the 50% roll along method also creates gaps in the data at depth where there is minimal overall between adjacent profiles. Measured or apparent resistivity profiles are commonly compared with inversion models to assess data coverage and gaps under profiles. Resistivity profiles can have anomalous 'vertical' structures at depth. These vertical structures occur where the inversion process attempts to project low resistivity zones deeper than is supported by the data acquired measured resistivity. These artefacts are identified in the survey profiles.

The survey was conducted under consistent application of the relevant health and safety legislation. For details refer to the Survey Safety Plan, the induction records, and safety meeting minutes.

Prior to entering the field, waypoints were generated for electrode locations. These waypoints were imported into the Avenza mobile app and used for navigation and locating survey lines.

The resistivity data was acquired using a ZZgeo 64 channel resistivity system (Figure 8). An electrode spacing of 5m was used with a dipole/dipole array. Field data was acquired by a geophysicist with the following processes in place:

- Bollards were deployed for each profile for staff safety (Figure 9).
- All electrodes were watered using salty water (~200-500ml per electrode)
- Manual recording of station location and checking of contact resistance for all electrodes
- Verification of signal stability for all electrodes
- 50% overlap between arrays to ensure comprehensive coverage and data repeatability.
- Data and any cultural features were recorded in the operator's field notes for review in conjunction with later quality control.
- Resistivity data were acquired at all sites
- Raw waveform data was acquired at all sites.
- 1 second read times were used at all sites.
- Datasets were checked each night for quality and consistency between adjacent profiles

Station Spacing	5m
Resistivity Array	Dipole-Dipole
Number of Electrodes	64 electrodes were used for all survey lines except where fences/ponds limited access
Survey/Positioning Datum	GDA94 MGA56
Elevation Datum	Australian Height Datum (AHD)

Table 3. Acquisition Parameters

Figure 8. Typical survey layout showing ZZgeo unit and tablet for data acquisition. Equipment was powered using a deep-cycle battery.

Figure 9. Data acquisition focused on roadsides where access was good and deployment of electrodes was easy. Bollards were used to show other vehicles on the site where Fender staff were working. Image taken south of Ash Dam B facing west.

3.3 Production summary and initial results

Fender staff arrived on site on the afternoon of 08/08/2022. Staff spent most of 09/08/2022 undertaking site inductions and safety meetings, with some testing of the equipment started on that afternoon. Data acquisition occurred between 10/08/2022-13/08/2022 and 15/08/2022-19/08/2022 (Table 4). Sunday (14/08/2022) was a mandated rest day consistent with CS Energy WHS policies.

Data acquisition on 10/08/2022 was slow due to issues with frequently blowing fuses on the ZZgeo system. Field testing revealed this to be caused by high current draw on the system due to the highly conductive subsurface. After lowering the input voltage and determining data quality was still acceptable, data acquisition continued at an acceptable rate for the rest of the survey.

The resistivity returned from the electrode test ranged from 100-5000 Ohm.m. The system determined an optimum input voltage of 360V, however due to the fuse issue noted in the preceding paragraph, output voltages were maintained at 120V for the entire survey.

Production rates were excellent through the survey. Staff acquired 5 profiles on most survey days. A maximum of 6 was acquired on 1 day. Factors that limited data acquisition included:

1) Identification of the current draw issue and the need to purchase additional fuses
2) The presence of long grass (i.e., the southwestern corner of the field area)
3) Lines that were not 'roll-along', i.e., all equipment needed to be retrieved and moved to a new area.
4) A 2-hour break for wet weather on 13/08/2022

Surface resistivities were highly variable throughout the survey area. The surface substrate ranged from:

1) wet clays along the southern and western margins
2) sands, gravels clays along the southern margin of the dam
3) frequent shallow rock in the south-eastern survey area (lines 1-3)
4) rock and rubble at the start of line 13.

On completion of the field work all electrodes and cables were removed, and all electrode sites returned to their pre-survey state. All field supplies were removed from the survey site.

Table 4. Survey production summary.

3.4 Data processing

Data was downloaded from the receiver at the end of each day of the survey. Initial QC of the data was undertaken by Fender at camp after each day. The raw resistivity data was assessed using the FlashRES software for overall data quality and consistency. The data was then exported in Geosoft ASCII format and loaded into Res2Dinv for geophysical inversion modelling. Final plots of the resistivity profiles were made using QGIS.

1. Data files were imported into the **ZZ_Rdatacheck** software.
2. The files were visually inspected, and quality ('Q') thresholds were set to 30. An *.inp file was generated for further analysis and processing
3. The *.inp file was opened in **flash2res2inv** and the resistivity data were exported into a *.dat file for inversion **using Res2Dinv**.
4. The *.dat files were imported into **Res2Dinv** and then edited to remove erroneous measurements from the data. This editing was repeated 2-3 time if required.
5. Many of the survey lines consisted of multiple profiles (table 4). These lines were concatenated into single profiles before inversion.
6. The data then underwent geophysical inversion to convert the apparent resistivity data into models of measured resistivity. A 'robust inversion' was used.
7. From **Res2Dinv,** the inversion files were exported in an XYZ ASCII format. These text files were converted into *.tif images and imported into QGIS to produce pseudo-section plots.

4.0 DATA ANALYSIS

Data acquisition was split into five spatial domains for acquisition and interpretation:

1) The western margin of the property
2) The southern margin of the dam
3) The southern margin of the property
4) The south-eastern groundwater profiles
5) The western stormwater diversion channel

Boreholes from the Callide Power Station site were used to aid the interpretation of the resistivity data. As well as providing observations of geology and the nature of weathering or fracturing, the bores provide indications of moisture, standing water level (SWL), and depths of groundwater sources. SWL is the distance from the ground surface to the water surface. Depths of groundwater sources are exactly that. SWL is influence by local and regional hydraulic gradients and is often shallower than the groundwater source.

Domain	ERI Lines	Bores
The western margin of the property	6,7	128671, MW26, MW60, 170017A, MW27, MW56
The southern margin of the dam	14,5,4	MW36, 170113A, MW64, ESC1, MW29, MW24
The southern margin of the property	12,11,10,9,8	170020A. MW28D, MW49, MW53, MW50, MW48, MW78, MW65, MW51, MW52, MW30, MW13
The western stormwater diversion channel	8+13	MW58, 128838A, MW40, 128681
The south-eastern groundwater profiles	1-3	MW32, MW33, MW31, MW43

Table 5. Survey domains and lines with adjacent boreholes

4.1 Identification of drill sites

The geophysical survey undertaken on the Callide Power Station site aimed to identify potential sources of groundwater and dam seepage, especially at depth in fractured rock aquifers to aid in managing PFAS contamination and migration. Additional sites for drilling to better monitor and manage PFAS migration need to be located.

Fender have provided:

1. Coordinates of proposed drilling locations
2. Drilling locations identified on transects
3. A short paragraph justification for each
4. A qualitative ranking of the sites.

Presently there are several unknowns and data gaps in the information provided which have limited a full interrogation of the survey site and proposed bore locations. These gaps include:

1. There have been numerous bores/ wells drilled on site but drilling logs have only been provided for a small number of these: i.e. boreholes exist for 'depth to bedrock' around the perimeter of the dam (Figure 5) but there is no accompanying borehole geology
2. PFAS testing results have been provided for a small number of bores only. These are the only bores that have been tested
3. It is unclear if these bores have been sampled and tested on more than a single occasion.
4. The obvious near-surface seepage channels in the alluvial sediments are well characterized, but deeper groundwater flow is not well-defined by the provided bore logs with most bores only drilled to shallow depth in alluvium and/or regolith. There is evidence of deeper groundwater flow in the deeper monitoring bores in layers of fractured andesite. Elevated PFAS appearing in bores such as MW32 and MW33 that have no potential shallow groundwater connection to the dam also confirm some deeper groundwater flow in the hard rock.
5. Basement profiling from the bore logs along the dam wall (Figure 5), also indicate some basement irregularities that may potentially be related to fracturing and faulting near the eastern edge. No bore logs were available for the bores along the dam wall and no PFAS test results were shown at these bores so the exact nature of the geology in that area is hard to determine.

4.2 Western margin of the property

Survey lines 6 and 7 mapped the western margin of the Callide Power Station site (Figure 10). Line 6 was orientated NNW/SSE followed the western fence line along the cleared fire trail. For interpretation purposes the line is split in to two parts (A and B). Line 7 trended NNE/SWW but merged with Line 6 at its southern end. Six bore holes (Figure 11) were used to ground truth lines 6 and 7 (128671, MW26, MW60, 170017A, MW27, MW56).

The upper 10-20m of the resistivity profiles have low resistivity (<10 ohm.m). This is likely driven by the high clay content in the soil and numerous shows of groundwater in the adjacent bores (Figure 12-14). All the bores show groundwater or traces of moisture within the upper clay and mixed clay/sand/gravels above the bedrock. Bedrock can be identified where resistivity increases rapidly from 100-1000 Ohm.m. However, borehole data shows that the upper rock units are commonly highly weathered or fractured (i.e. bores RN170017 and MW27) and may act as a more 'gradational' boundary between the alluvium and hard rock. The surface of the interpreted bedrock is generally parallel or sub-parallel to the land surface. There are zones of low resistivity at depth within the profiles. Line 6 shows vertical low resistivity zones at 450m, 1230m, 1730m along the profile as well as an extended low resistivity zone between 1400-1500m along the profile (Figure 12, 13). Line 7 shows zones of low resistivity at 130m, 300m, and 530m, along the profile (Figure 14).

4.2.1 Proposed Borehole

Site 9 lies near the southern end of Survey Line 6b along the western embankment (Figure 10 and 13). The site is adjacent to mapped alluvium and is located in area of 'dominantly diorite'. This site is proposed because it targets the middle of a broad area of low to moderate resistivity indicative of potential moisture at depth. The site also fills a significant gap in the monitoring well spacing between MW56 at the southern end of the line and MW27 700m to the north. Although the site is located to fill a gap between existing bores the broad spread of low resistivity values is considered worthy of further investigation.

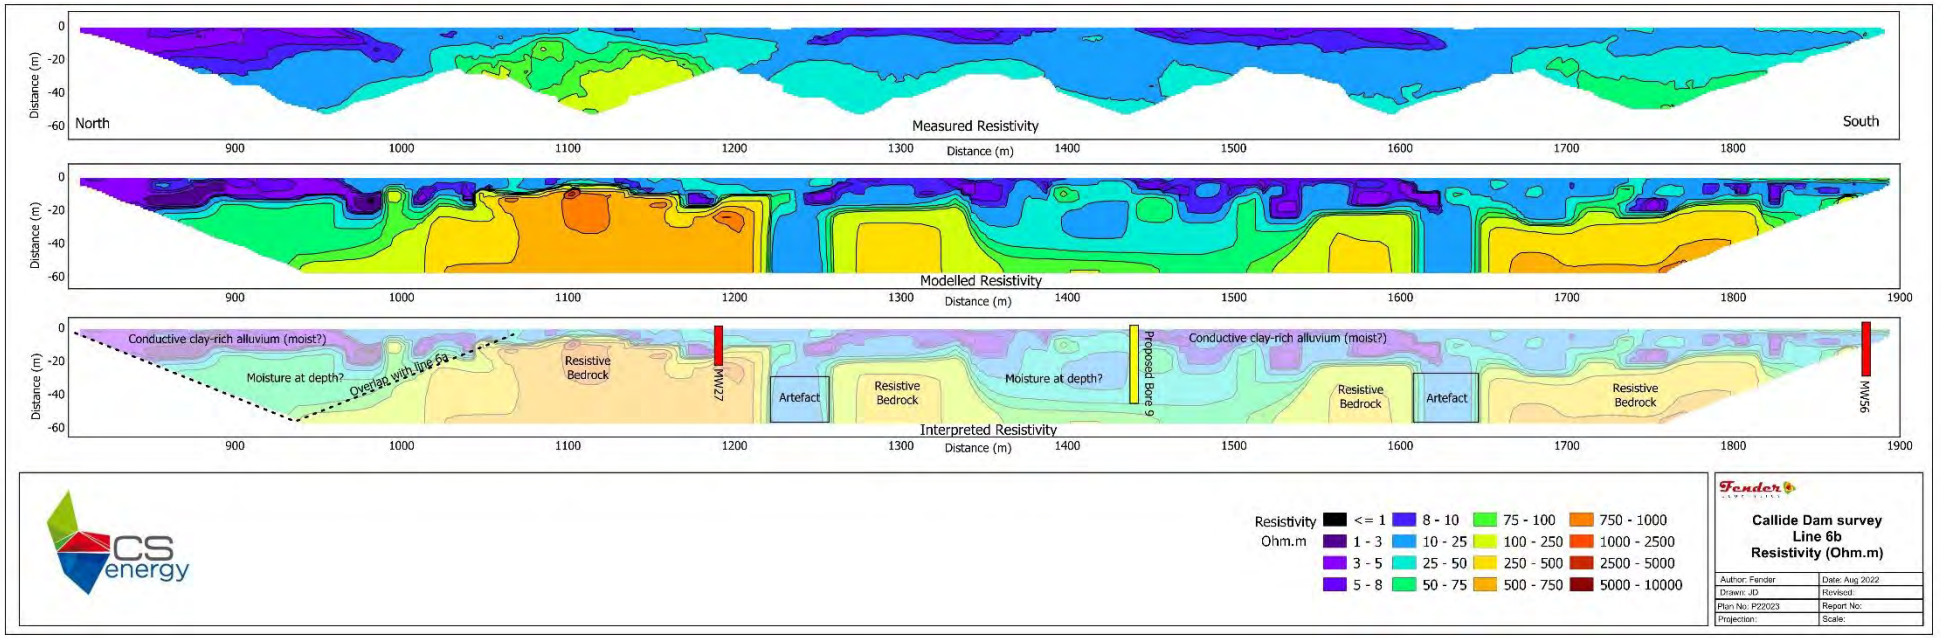

Figure 13. Resistivity and interpretation for Line 6b (partially overlaps with line 6A). Proposed bore 9 is marked (yellow).

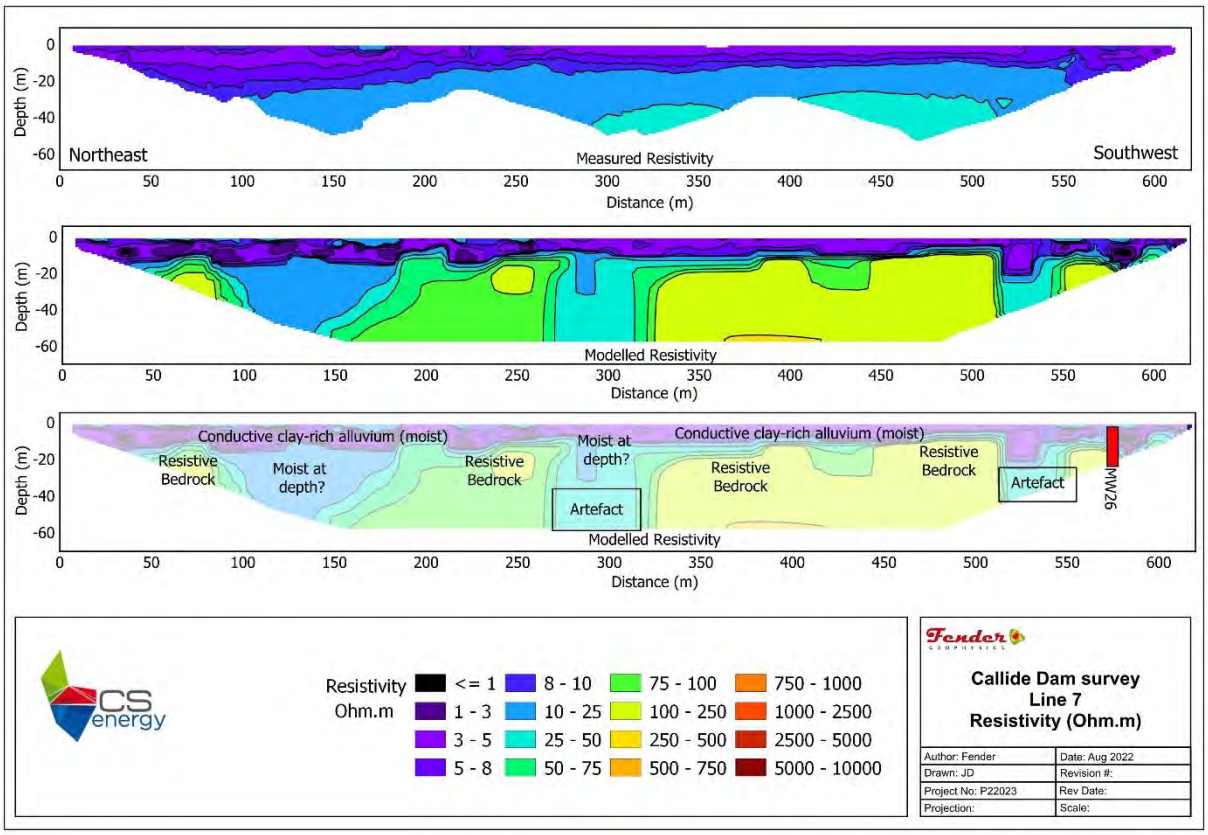

Figure 14. Resistivity and interpretation for Line 7.

4.3 Southern Margin of the Ash Dam

Survey lines 14, 5, and 4 mapped the southern margin of Ash Dam B (Figure 15). The three lines were orientated ENE/WSW. Six bore holes (MW36, 170113A, MW64, ESC1, MW29, MW24) were used to ground truth the resistivity profiles (Figure 16). Similar to the western profiles, the Ash Dam profiles are characterised by an upper conductive unit and a lower resistive unit that is assumed to separate an upper dominantly alluvium unit from a lower bedrock unit. However, the highly conductive alluvial unit is less continuous than is observed on the western margin of the property. Line 14 shows a thick (up to 20m) highly conductive unit at its western end extending from 0-200m along the profile (Figure 17). This unit is intersected by bore MW36 (which contains rock from 7m depth) and suggests that despite its high conductivity it might also be characterised by significant amounts of weathered/fractured rock which is also moist/wet. Further east along profile 14, rock is frequently interpreted at the land surface (i.e. bore MW64) or within a few meters of the land surface (i.e. bores RN170113 and ESC1). The thin and discontinuous nature of the alluvial unit is also observed in Lines 5 and 4 (Figure 18 and 19) further to the west. There appears to be change in the geophysical response of the bedrock between Line 14 (west) and lines 5 and 4 (east) with lower resistivity responses observed at depth to the east, this is possibly a result of different subsurface geology or more moisture at depth.

Groundwater is observed in all six bores along the profile with most occurrences of groundwater and moisture limited to the upper alluvium. There is some evidence of groundwater within bedrock at ~27m depth in bore MW64. Bore MW29 shows significant groundwater within bedrock at depths of 8-12m and evidence of moisture at all depths.

4.2.1. Proposed boreholes

Proposed boreholes 1, 2, and 3 all appear on Survey line 4 and overlap on 5 at the far eastern extent of the survey area. The geology is characterised as andesite and therefore promising in regard to its capacity to act as an aquifer. There is a broad area of low resistivity at both the eastern and western extents of survey line 4 and are targeted by bores 1 and 3. These 3 bores (as well as proposed bore 4) were chosen to help determine the potential pathways resulting in the elevated PFAS levels seen in the deeper bores (MW31, MW32, MW33 and MW43) to the south. While much of the PFAS contamination in the study area is observed in shallow bores and a result of seepage, these four bores were drilled deeper in hard rock that would require a deeper pathway for groundwater contamination to migrate to.

Site 1 was chosen due to the low resistivity values observed at depth at the eastern end of profile 4 and due to its correlation to the inferred fault on the geological map provided (Figure 19). If the fault does exist as inferred, it is potentially an explanation for the elevated PFAS seen in the deeper bores to the south (MW32 and MW33) as the fault system may be acting as a groundwater conduit at depth in the hard rock. Those 2 bores to the south have no potential shallow groundwater pathway due to the local topography so a deeper groundwater flow path must be present to explain the PFAS migration. It is likely PFAS migration to this area is very slow and the elevated PFAS seen is a concentration due to low groundwater velocity.

Site 2 was chosen as there is a significant hole in the deeper bore coverage in that area (Figure 18). It is near to the existing MW30 bore where AD contamination was noted but the hole was only drilled to 9m deep. Both Line 4 and 5 show low resistivity in the area extending to depth (but more prominent in the line 5), and there are no deep monitoring bores nearby.

Site 3 is in the middle of a deep area of low resistivity picked up on both Lines 4 and 5 and up gradient from MW43 where elevated PFAS was recorded (Figure 18 and 19). Other deep bores in the area (notably ESC1 and ESC3) were both recorded with significant groundwater flow at depth in fractured andesite.

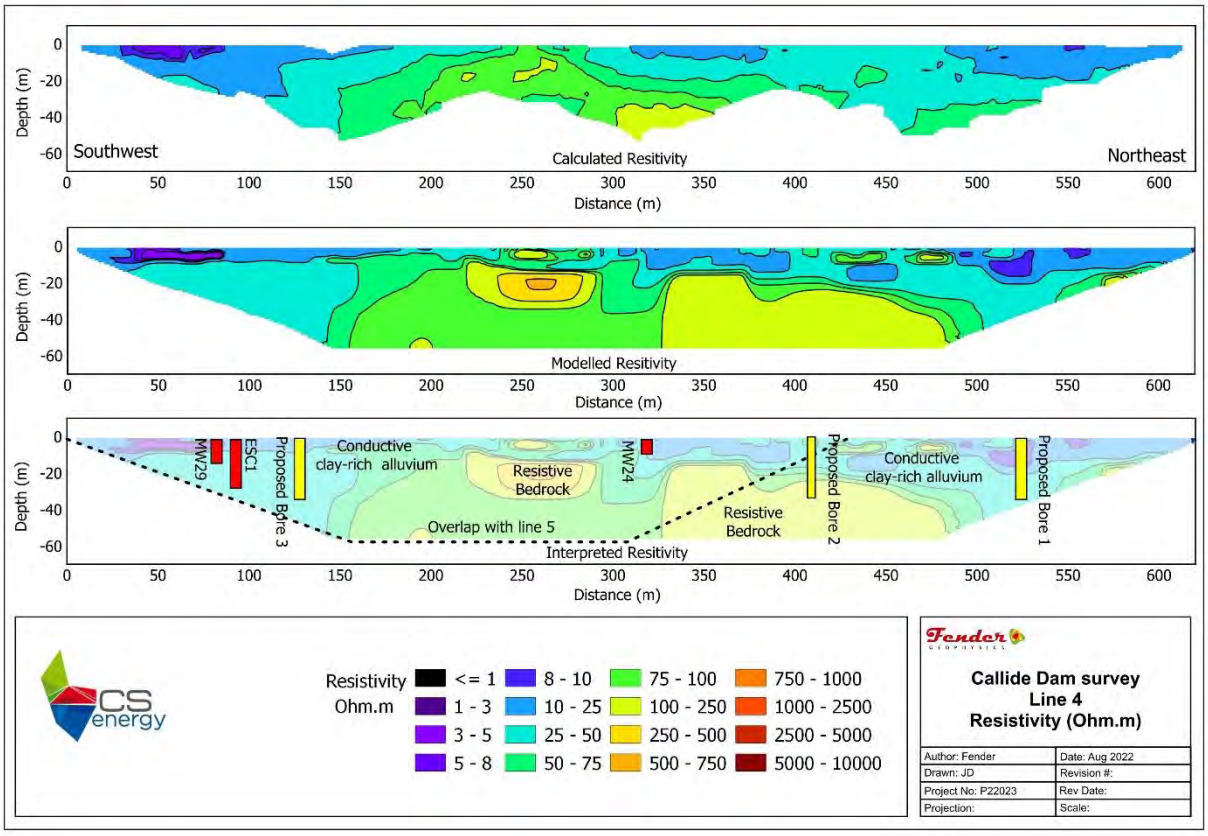

Figure 19. Resistivity and interpretation for Line 4 (partially overlaps with line 5). Locations of proposed bores 1, 2, and 3 are indicated (Yellow)

4.4 Southern Margin of the Property

Survey lines 12, 11 ,10, and 9 were mapped the southern margin of the Callide Power Station property (Figure 18). Lines 12 and 11 were oriented E/W, while lines 10 and 9 were orientated SW/NW. Twelve boreholes (Figure 19) were used to ground truth these profiles (170020A. MW28D, MW49, MW53, MW50, MW48, MW78, MW65, MW51, MW52, MW30, MW13).

Line 12 (Figure 20), the westernmost line, is characterised by an extensive upper conductive and dominantly alluvium unit from a lower resistive bedrock unit. This upper unit is continuous for 800m along the profile though it is less evident to the east. Boreholes 170020A, MW28D, MW49, MW53, and MW50 indicate depth to bedrock is approximately 5-12m throughout the profile. However, the conductive unit thickens substantially between 250-830m along the profile (to greater than 20m). No borehole data exists along this section of the profile; however, the data indicates that the alluvium is thicker or there is more moisture at depth at that location. Boreholes MW28D, MW49, and MW53 all show thick upper units of moist rock and alluvium.

Lines 11 and 10 (Figure 21 and 22) show the upper conductive and dominantly alluvium unit is more discontinuous with bedrock reaching the land surface or within a few meters of the land surface at some locations (i.e., bores MW48, MW78, MW65, MW51, and MW52). There is some evidence of moisture at depth with a low resistivity zone extending from 200-320m along Line 10 (and partially imaged in Line 11). Bores MW51 and MW52 show that this low resistivity zone is bedrock but likely more moist than the adjacent rock.

Line 9 (Figure 23) shows a continuous upper conductive and dominantly alluvium unit down to approximately 10m, with bore MW30 showing moisture down to depths of 9m (the base of the borehole). This unit deepens to 30-40m at 420-470m along the profile where there is possibly more moisture at depth.

4.3.1. Proposed boreholes

Boreholes 5, 6, and 7 are located along Survey Line 12 in the SW corner of the dam in the middle of the broad area of seepage identified there (Figure 20). Survey Line 12 shows an extended area of near surface seepage across almost the entire survey line excluding the most easterly 250m where elevated basement and high resistivity are observed. Boreholes 5, 6 and 7 all target specific areas in the broad expanse of seepage where low resistivity is seen extending to depths of 40m. They also help fill in an area where bores are relatively sparse compared to the coverage in the main areas of seepage.

Borehole 4 is adjacent to proposed boreholes 1-3. It is located to help determine the potential pathways resulting in the elevated PFAS levels seen in the deeper bores (MW 31, MW32, MW33 and MW43) to the south. The borehole is located within is a significant area of low resistivity at 420-470m along the Survey Line 9 profile extending to depth indicating possible moisture (Figure 23).

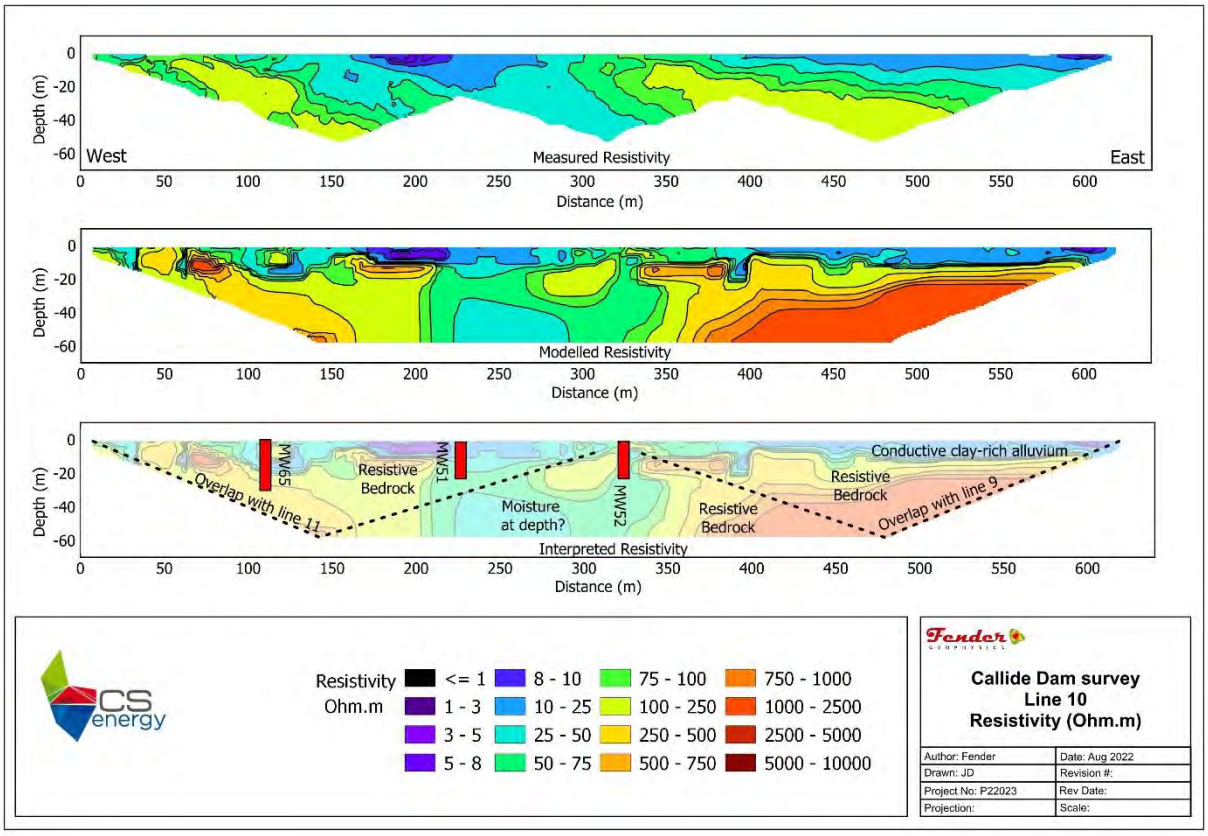

Figure 24. Resistivity and interpretation for Line 10 (partially overlaps with lines 11 and 9).

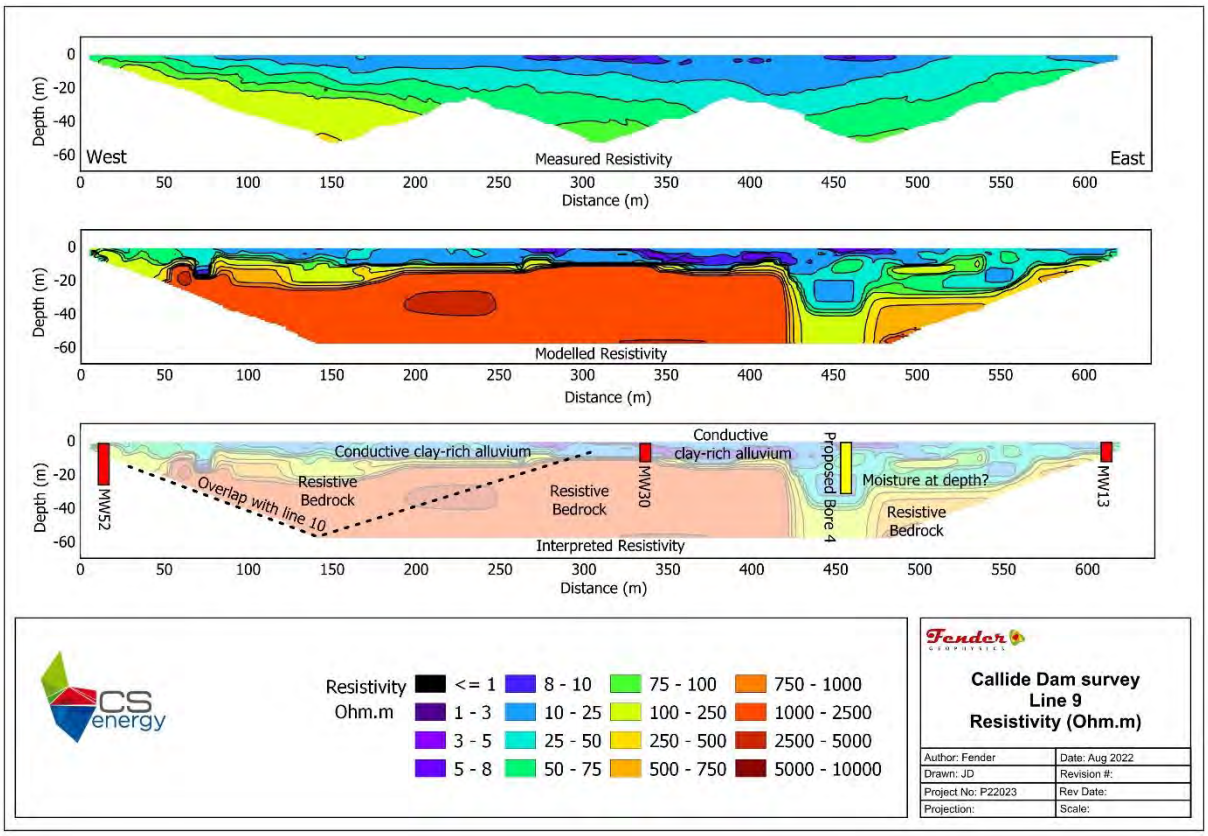

Figure 25. Resistivity and interpretation for Line 9 (partially overlaps with line 10). Location of proposed bore 4 marked (Yellow)

4.5 Western stormwater diversion channel

Two survey lines were acquired over the western stormwater diversion channel (Figure 24). These are lines 8 and 13. Line 8 was orientated NW/SE and adjacent to bores MW40 and RN128681 (Figure 25). Line 13 was orientated at SW/NW and adjacent to bores RN128838 and MW40.

Line 8 (Figure 26) is characterised by an upper conductive unit and a low resistivity unit that is assumed to separate an upper dominantly alluvium unit from a lower bedrock unit. The boundary between these units is typically 10m and is supported by bore MW40 showing the boundary at 9m (and moisture between 4 and 15m). The boundary between these units deepens to 30-40m between 250-350m along the profile and indicates moisture at that location.

Line 13 (Figure 27) extends from the SW corner of the Callide Dam property towards a drainage dam. This line is comparatively short as it was constrained by a dam to the north and a boundary fence to the south. Similar to most lines in this study the resistivity data shows an upper conductive unit (dominantly alluvium) and lower resistive unit (bedrock). However, the bedrock unit has a characteristically low resistivity of 100 Ohm.m. Despite the low resistivity at depth within the profile, bore RN128838 indicates bedrock from ~7m depth.

4.4.1. Proposed Borehole

Site 8 targets a strong contrast in resistivity from very high along the western edge of the survey to a resistivity low extending to depth at 240 – 270m along the survey line. If a deeper groundwater pathway exists in the southwest corner it is likely to be passing through Point 8. Both Site 8 and Site 7 are near bore MW49 where elevated PFAS was recorded and may intersect the potential deeper groundwater pathway involved. The area west of MW49 is well covered by the existing network of bores.

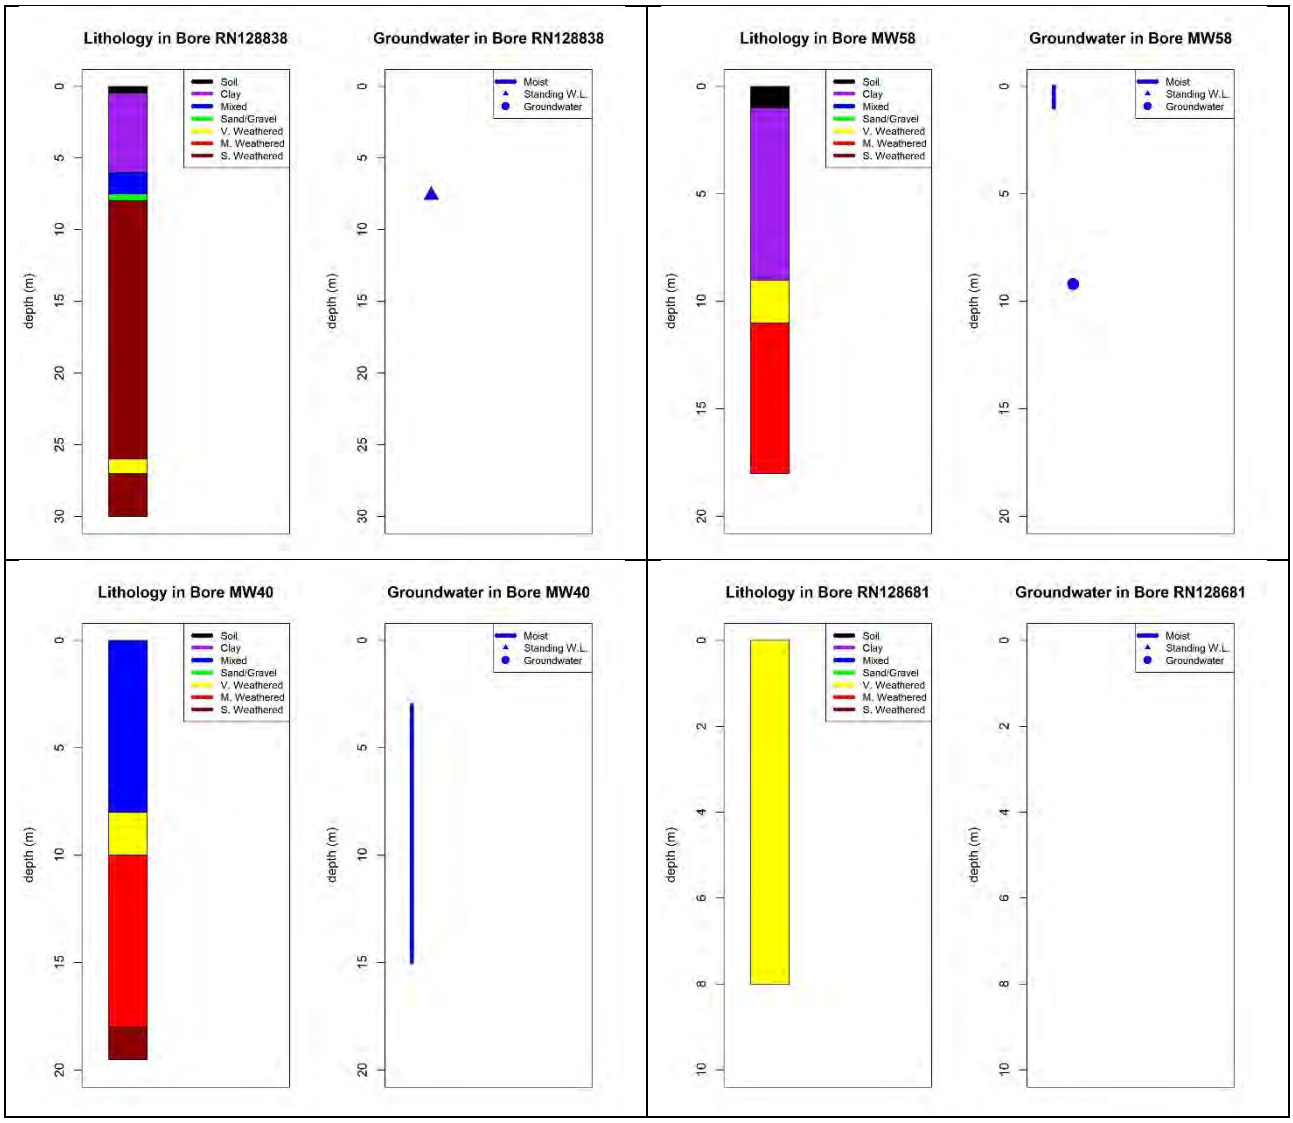

Figure 27. Borehole geology and groundwater indicators from the western stormwater diversion

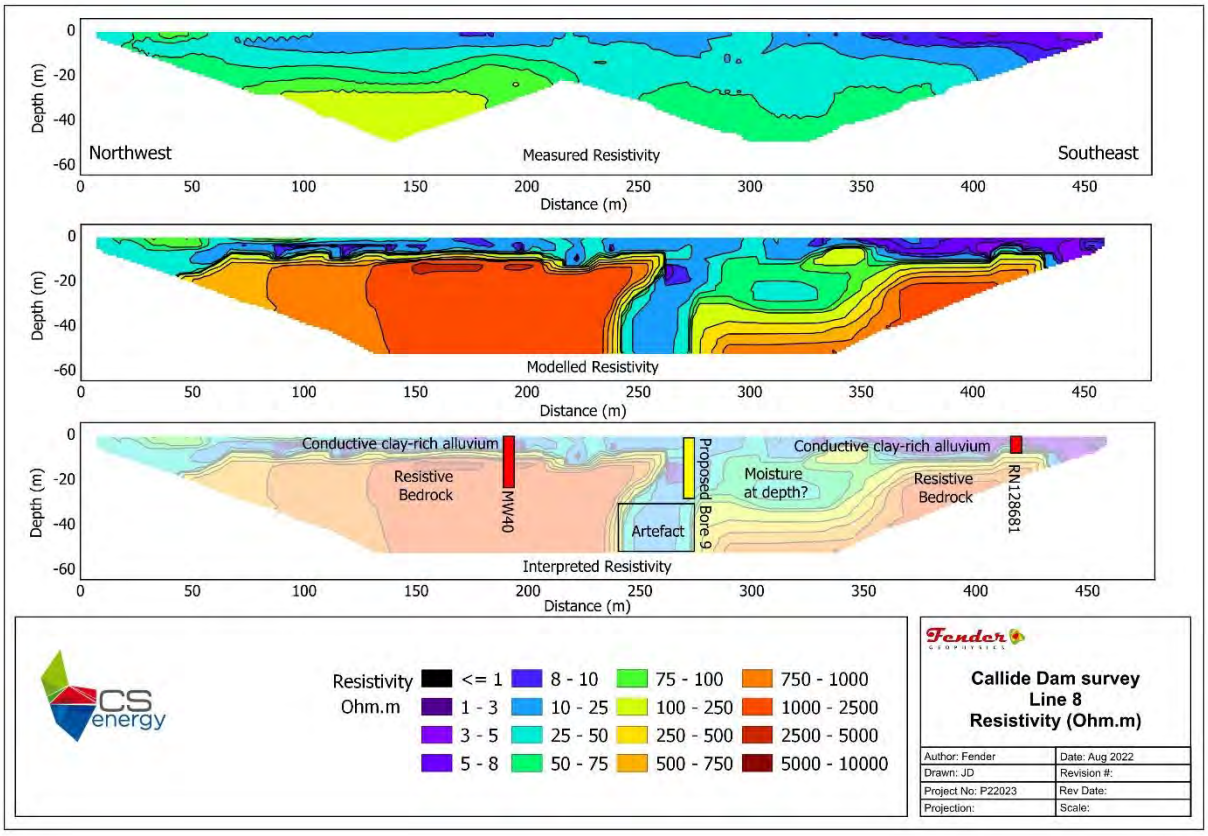

Figure 28. Resistivity and interpretation for Line 8

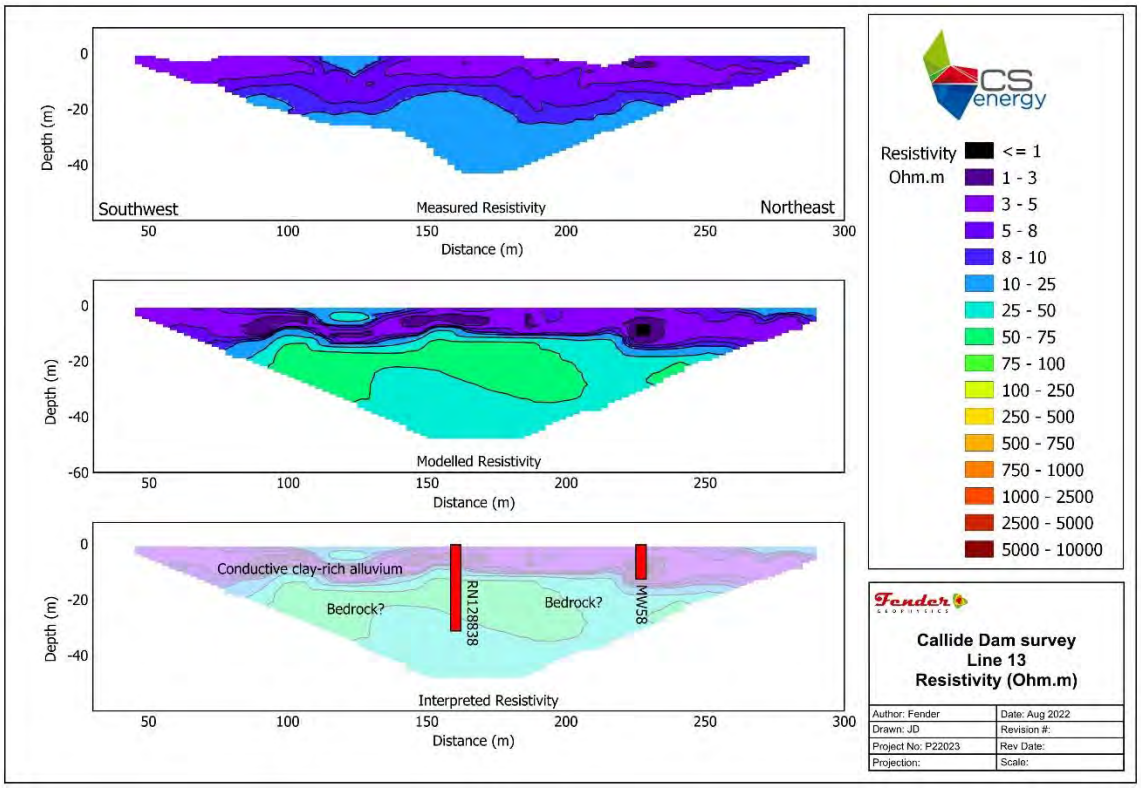

Figure 29. Resistivity and interpretation for Line 13

4.6 South-eastern groundwater profiles

Three survey lines (Lines 1-3) were acquired for the south-eastern groundwater profiles (Figure 28). However, lines 2 and 3 were joined together to make a single line after it was decided to move the lines that were originally planned further north-east. Line 1, the northern line is ground-truthed by bores MW32 and MW33 (Figure 28). Line 2/3 is ground-truthed by bores MW43 and MW31, however, these two bores were found at up to 50m from the resistivity profiles and thus are considered to be a less reliable indicator of geology and groundwater.

Line 1 has a comparatively resistive, upper alluvium unit (Figure 30). Bedrock was observed outcropping along the profile and Bores MW32 and MW33 also indicate shallow bedrock occurring at 1 and 3m depth respectively. Bore MW32 indicates the presence of groundwater between 17-19m depth within moderately weathered bedrock.

Line 2-3 is similar to Line 1 in so far as its upper alluvium is comparatively resistive and outcropping bedrock occurred within the profile (Figure 31). Bore MW31 indicated the presence of groundwater from 1-14m depth and suggest that groundwater likely exists in the area.

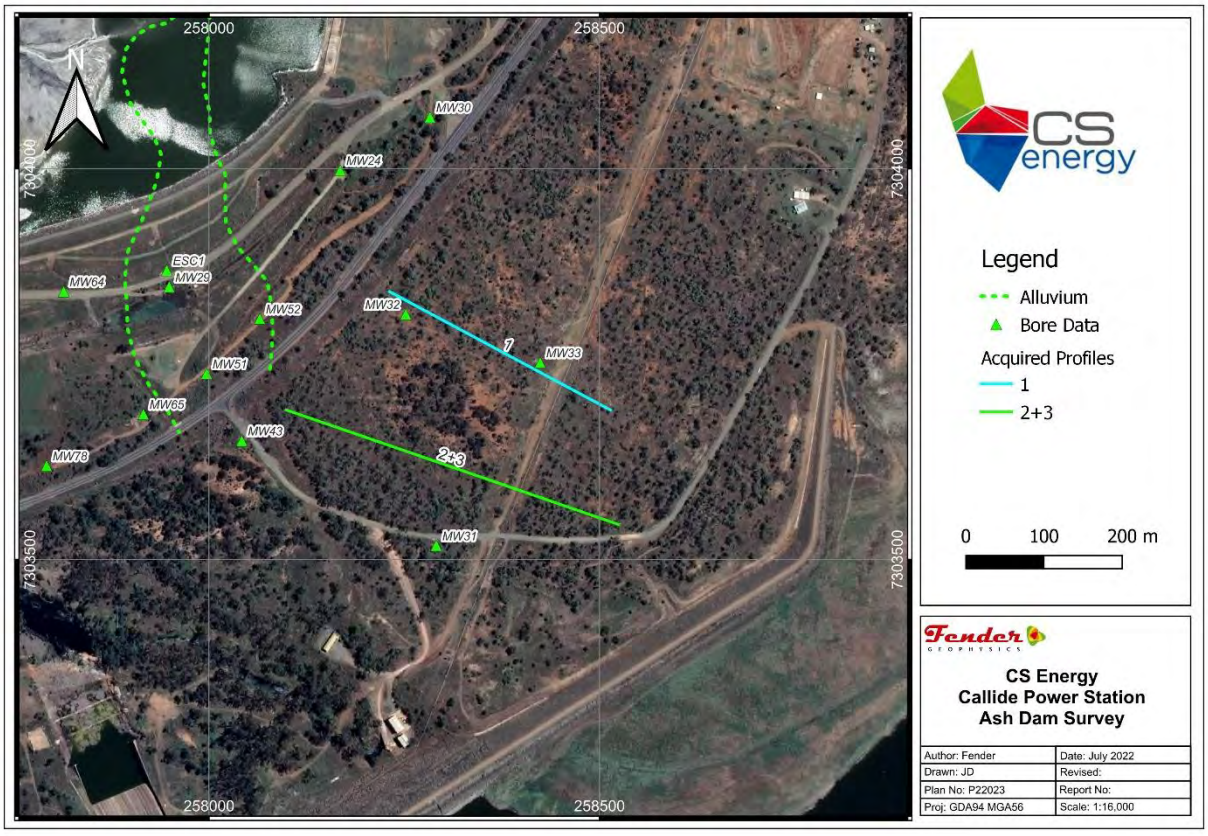

Figure 30. Geophysical survey lines and boreholes adjacent to the south-eastern groundwater bores.

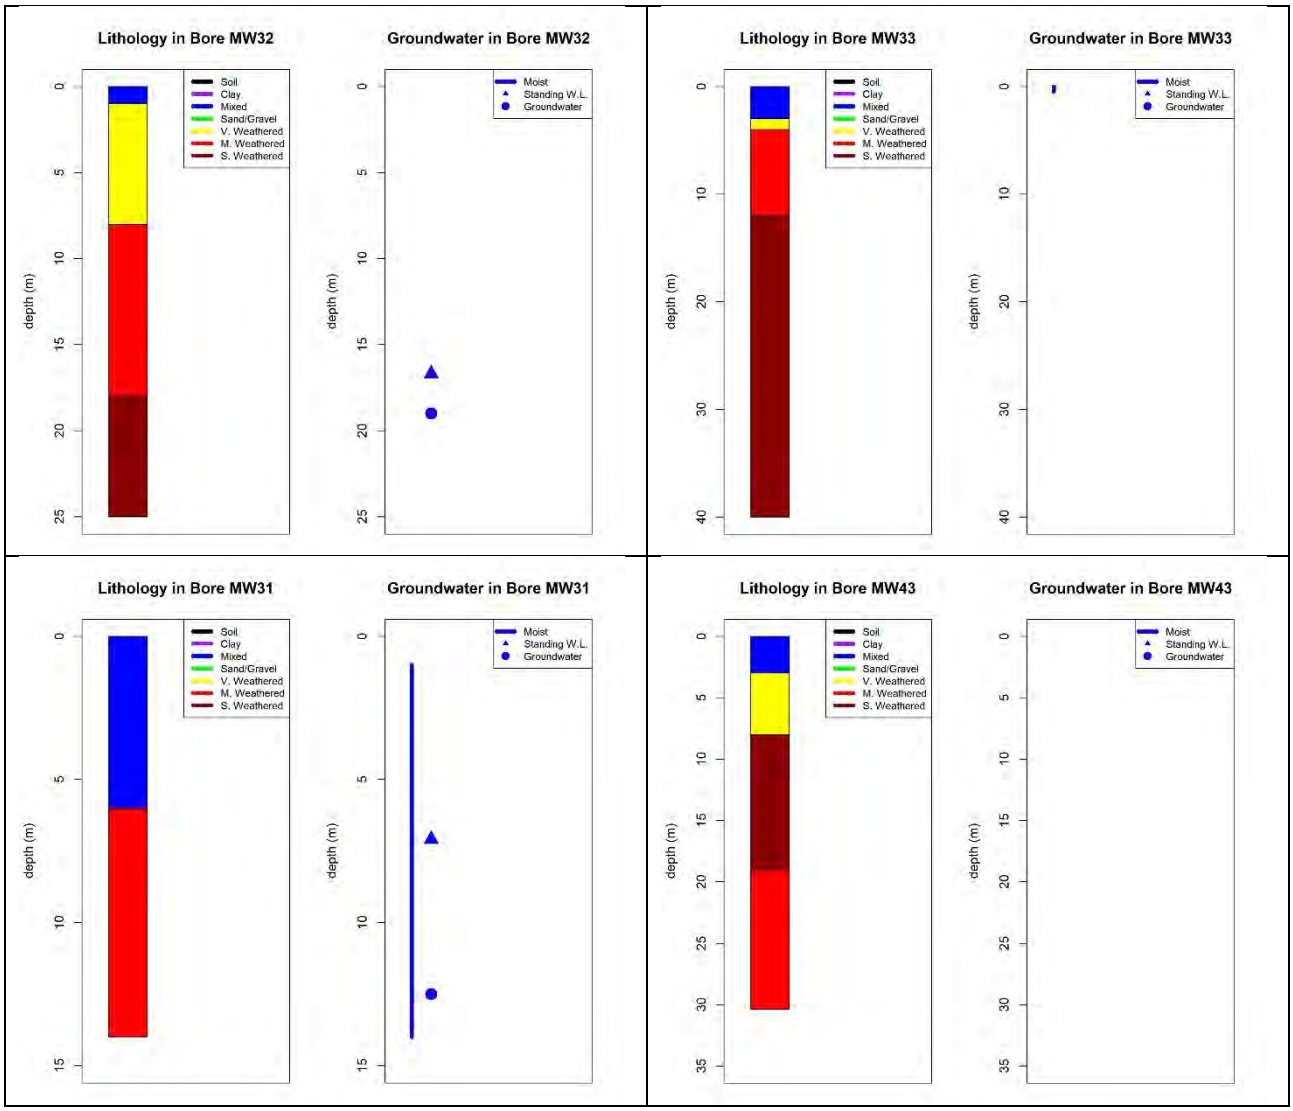

Figure 31. Borehole geology and groundwater indicators from the south-eastern groundwater bores

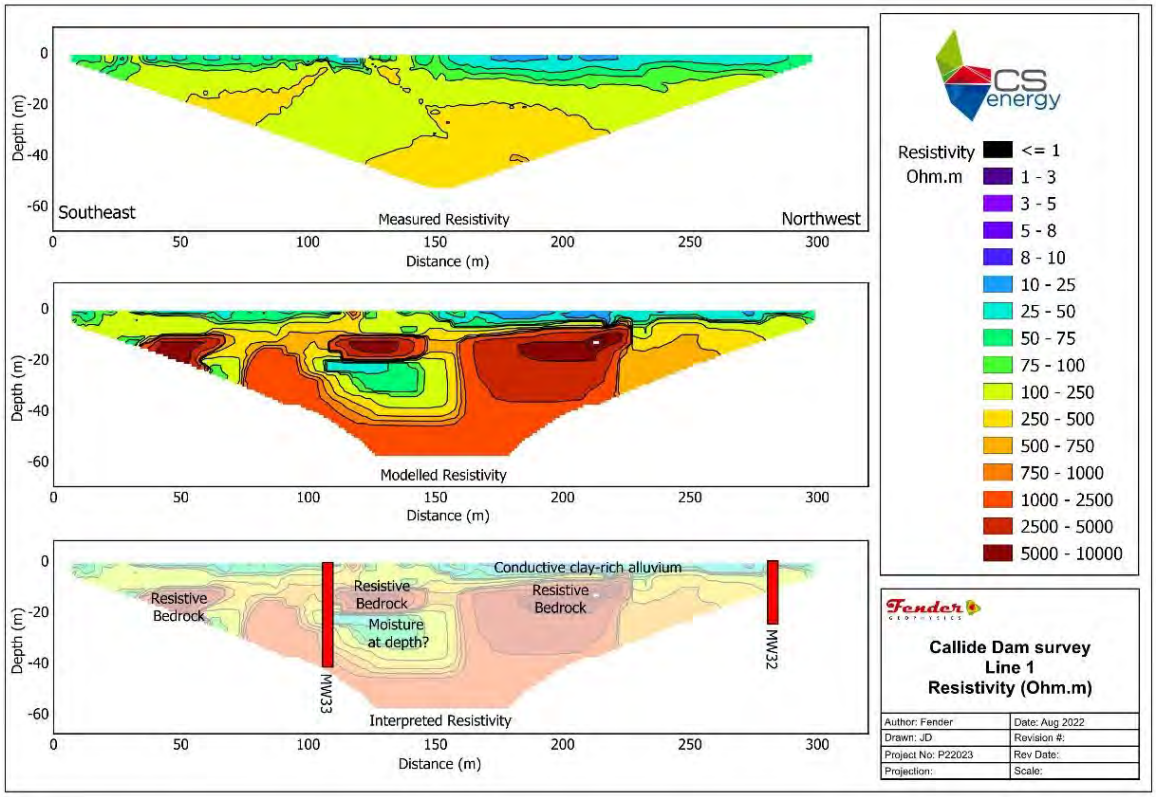

Figure 32. Resistivity and interpretation for Line 1.

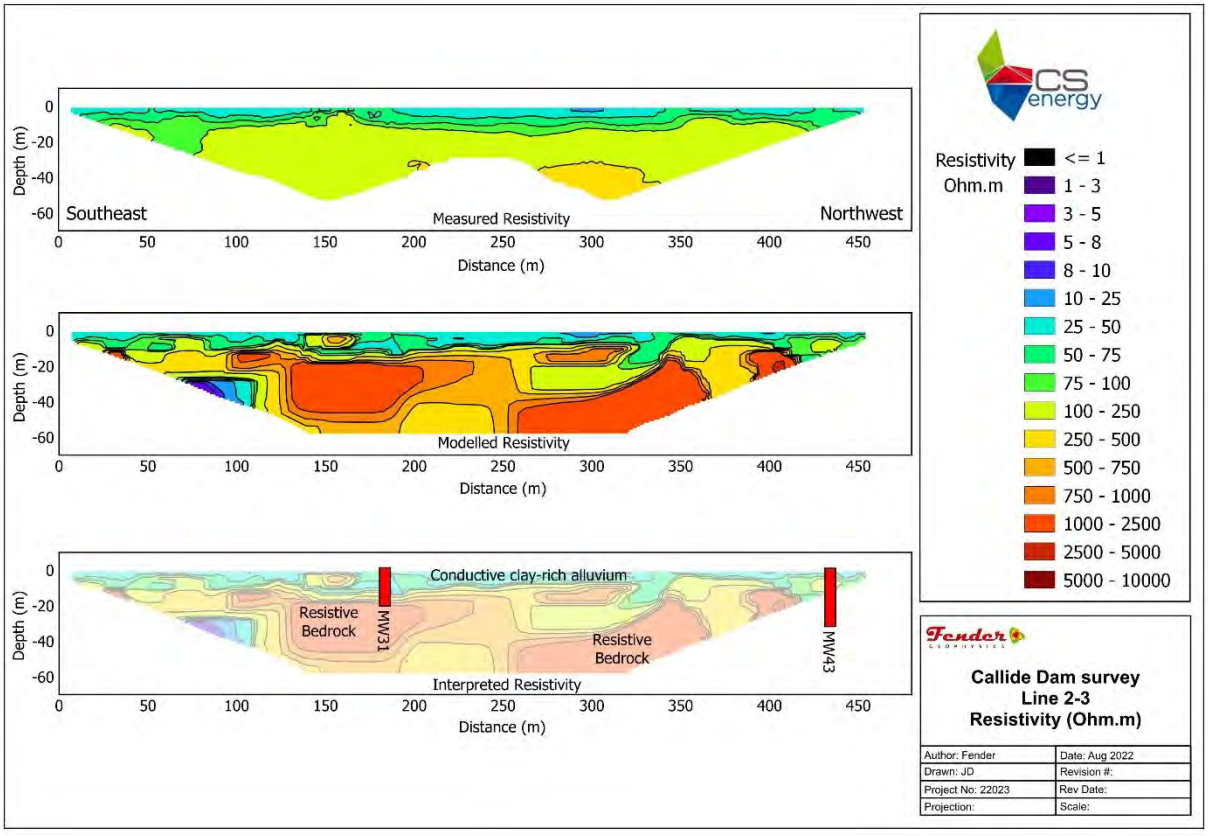

Figure 33. Resistivity and interpretation for Lines 2 and 3 (combined)

4.7 Borehole summary.

Five main geographic areas have been identified containing the proposed boreholes:

1. Eastern edge (Bores 1, 2, 4)
2. Southeast (Bore 3)
3. Southern margin (Bores 5-6)
4. Southwest corner (Bores 7-8)
5. West embankment (Bore 9)

For prioritising the 9 sites it is recommended to initially choose one from each area. Within the scope of the 9 bores, borehole 1 is considered a high priority as it lies on or near to the inferred fault and would be a likely conduit for groundwater. Although there are three proposed bores in that area the fault is a potential conduit and a gap in the well coverage that should be investigated. Bores 2 and 4 are considered secondary but should be re-evaluated depending on the result from bore 1.

Bore 9 is considered a 'gap-filler' but it does have a significant spread of low resistivity in its vicinity and does not have a monitoring well anywhere near it. It is worth investigating, but its priority could be decided on whether CS Energy prefers to focus on areas of known/suspected seepage or wanted to identify a new area of seepage that is potentially risky. The client could discount Bore 9 early in the prioritising process if it was considered too risky or costly.

From the southern margin bores 5 and 6 consist of similar targets. Bore 5 is approximately 50m from bore MW53 which shows presence of fractures rock, moisture and groundwater show at approximately 18m and could be considered a less risky target based on the data from bore MW53

From the southwest corner bores 7 and 8 also consist of similar targets. Existing bores close to proposed bores 7 and 8 (MW49 and MW40) have groundwater shows and moderately weather/fractured bedrock. However, there is little to differentiate the two sites.

All bores should be drilled to at least 30m depth.

Table 6. Proposed locations of boreholes (GDA2020 - MGA56)

Site No.	Easting	Northing	Area
1	258316 m E	7304140 m N	Eastern Edge
2	258240 m E	7304067 m N	Eastern Edge
3	258017 m E	7303883 m N	Eastern Edge
4	258385 m E	7304158 m N	Southeast
5	257338 m E	7303547 m N	Southern Margin
6	257223 m E	7303527 m N	Southern Margin
7	256919 m E	7303498 m N	Southwest Corner
8	256873 m E	7303641 m N	Southwest Corner
9	256421 m E	7303879 m N	Western Embankment

5.0 Project Summary

Over nine survey days, 41 resistivity profiles were acquired in the vicinity of the Callide Power Station Ash Dam B. Where possible, the resistivity data was interpreted using adjacent boreholes. Boreholes close to the resistivity profiles were chosen for the interpretation though in some instances there are 10's of meters separating the bore from the resistivity data. The resistivity response of the subsurface is a complex response that results from a combination of rock mineralogy, weathering, presence of water and salts, and the composition of the soil and alluvium. Key results from the survey were:

1. Over the entire field area the resistivity response can be broken down into two main units.
2. The upper unit is highly conductive. This is likely a result of the presence of moisture but also the presence of clay which is reported extensively within the alluvium. The upper unit is laterally extensive in some areas like the western margin of the Callide Dam property (lines 6+7) but is discontinuous elsewhere. This upper unit also likely contains weathered rock in places.
3. The lower unit consists of bedrock and is frequently sub-parallel to land surface. In places the bedrock unit is discontinuous and suggests the presence of conductive groundwater. The bedrock in the field area is frequently reported as weathered and/or fractured suggesting that it possesses the capacity to hold groundwater.
4. Borehole data shows that the upper rock units are commonly highly weathered or fractured and may act as a 'gradational' boundary between the alluvium and hard rock within the resistivity data.
5. Borehole data indicates that groundwater is most frequently observed in the upper alluvium and weathered bedrock. However, it is observed in select locations within rock where it is sufficiently weathered or fractured.
6. Bedrock was only seen outcropping in the south-eastern groundwater sites but is found close to the land surface in places (as indicated by boreholes). The shallow rock appears to contribute to the comparatively thin and resistive nature of the alluvium in some areas.
7. Nine borehole locations have been identified for possible drilling to assist with site remediation.

6.0 DELIVERABLES

The following deliverables were provided following project completion:

- Factual report (this document)
- Raw field data in ZZgeo format
- Processed field data (*.dat) and inversion results (*.xyz) in Res2Dinv format
- Resistivity profiles in jpg and pdf format
- GIS files for line locations (*.shp)
- Table of borehole locations

APPENDIX O GHD BORE INSTALLATION AND SAMPLING REPORTS (GHD, 2023)

TOPA	Total oxidisable precursor assay

1 Introduction

1.1 Project background

CS Energy Limited (CSE) has undertaken a series of investigative works at Callide Power Station (the 'Project site') to investigate potential impacts and risks associated with the historical use of Aqueous Film Forming Foam (AFFF) at the site. The preliminary investigations were triggered by the Queensland Government's implementation of the *Environmental Management of Firefighting Foam Operational Policy* issued in July 2016. The policy provided information on the requirements for a three-year transition period to fluorine-free foams, or alternative foams containing at least 99.5% shorter-chain per- and poly-fluoroalkyl substances (PFAS).

Subsequent investigations were commissioned by CSE in response to the Department of Environment and Science (DES) notice to conduct an Environmental Evaluation (EE) (Reference: EPPR00536313 | CCPLRC-100046232, most currently dated 21 August 2023) requiring CSE to investigate and assess the source, cause, and extent of any actual or potential environmental harm resulting from the historical use of AFFF on site.

Table 1.1 outlines the program of works completed by CSE, from 2019 to date and the scope of works that GHD Pty Ltd (GHD) completed as part of the *Callide Groundwater Bore Drilling Project*, which included delivery of a drilling and bore installation program at CSE's Callide Power Station located near Biloela, in Central Queensland.

Table 1.1 Summary of the program of works completed at the project site from 2019 to 2023.

Program of work	Description	Year	Performed by
Preliminary investigation works	Sampling results from the Callide Power Station indicated that onsite groundwater, surface water, soils and sediments contained varying levels of PFAS contamination.	2019	CSE
Sampling and geophysical investigation	– Investigations identified groundwater seepage along the southern site boundary containing elevated concentrations of PFAS. – Electromagnetic Resistivity Imaging (ERI) survey investigations were completed which identified potential water-bearing zones along the site boundary. – ERI output was used to inform selection of possible drilling locations. Nine borehole locations were recommended by the geophysicist..	2021-2022	CSE
Groundwater bore drilling and installation works (ITT No. 491855)	– Drilling and installation of five recovery bores – Drilling and installation of six monitoring bores – Development of all 11 newly installed bores – Conducting pumping tests on five newly installed recovery bores and slug testing of five monitoring bores (one was dry) – Groundwater sampling and analysis of five new recovery bores, five new monitoring bores, and one existing monitoring bore. One new monitoring bore was not sampled as it was dry. – Soil and drill cuttings sampling and analysis. – Reporting (this report)	2023	GHD

CSE prepared a scope of work to undertake a targeted drilling and bore installation program to fulfill the requirements of the EE and to further characterise the potential source and extent of PFAS contamination likely to be caused from the storage and use of AFFF at the premises.

GHD were engaged to undertake the drilling, bore installation, and testing program. The *Callide Groundwater Bore Drilling Project* included the following tasks:

– Drilling and installation of five (5 No.) recovery bores and six (6 No.) monitoring bores
– Soil and drill cuttings sampling and analysis
– Pumping tests on the 5 No. recovery bores

– Groundwater sampling of newly installed bores plus one existing bore, i.e., five new recovery bores, five new monitoring bores (one new monitoring bore was not sampled as it was dry), and one existing monitoring bore
– Survey of newly installed bores
– Reporting

The details of the field program are outlined in this report, titled *Factual Bore Completion Report*.

1.2 Report purpose

The purpose of this report is to provide an outline of the methodology and summarise the results of the drilling and bore testing of 11 No. groundwater bores (5 No. recovery and 6 No. monitoring).

The report presents factual data collected and observations made during the field program, including services clearance confirmation, earthworks completed for drill pits, locations of recovery bores and monitoring bores, borehole drill and installation logs, bore development details, drill cutting and water disposal management details, bore survey details, slug testing analysis results, and pumping testing analysis results. The soil/solid sampling and groundwater sampling methodologies and results are reported in separate reports, *Soil Sampling Report* (GHD 2023b) and *Groundwater Sampling Report* (GHD 2023c), respectively.

1.3 Scope and limitations

This report is subject to the limitations set out below and must be read in conjunction with each of the supporting technical reports summarised in Section 1.2, as well as the assumptions, exclusions, and qualifications within the supporting technical reports.

This report has been prepared by GHD Pty Ltd (GHD) for CS Energy Limited (CSE) for the purpose of responding to a notice to conduct an environmental evaluation issued by the administering authority pursuant to section 326B of the *Environmental Protection Act 1994* (Qld) (EP Act) (the Purpose), and not for any other purpose. The report may be used by Queensland Department of Environment and Science (DES), acting in its capacity as the administering authority (as defined in the EP Act)), and the appointed contaminated land auditor, and Luke Amies (Suitably Qualified Person) for the Purpose. GHD disclaims responsibility and liability to any person other than CSE arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally possible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

While every effort has been made by GHD to assess contamination as required by the scope of services, GHD cannot, guarantee that other issues outside of the scope of services do not remain.

GHD has prepared this report on the basis of information provided by CSE and others who provided information to GHD (including Government authorities and analytical laboratories), which GHD has not independently verified or checked beyond the agreed scope of work. Where drill hole logs, laboratory tests and similar work have been performed and recorded by others the data is included and used in the form provided by others. The responsibility for the accuracy of such data remains with the issuing authority, not with GHD. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described throughout this report. GHD disclaims liability arising from any of the assumptions being incorrect. The opinions, conclusions and any recommendations in this report are based on information obtained from site inspections and sample collection at discrete locations across the site and may not fully represent the conditions that may be encountered across the site at other than these locations. It is emphasised that the actual characteristics of the sub-surface and surface materials may vary significantly between adjacent test points and sample intervals and at locations other than where observations, explorations and investigations have been made. Sub-surface conditions, including groundwater levels and contaminant concentrations can change in a limited time. This should be borne in mind when assessing the data. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

It should be noted that because of the inherent uncertainties in the sub-surface evaluations, changed or unanticipated sub-surface conditions may occur that could affect the opinions GHD has expressed, which may need to be re-examined and changed. GHD does not accept responsibility for the consequences of significant variations in the conditions.

An understanding of the site conditions depends on the integration of many pieces of information, some regional, some site specific, some structure-specific and some experienced based. Hence, this report must be read in full and should not be altered, amended, or abbreviated, issued in part, or issued incomplete in any way without prior checking and approval by GHD.

GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

1.4 Assumptions and qualifications

Assumptions and qualifications for the Callide Groundwater Bore Drilling Project drilling and installation program include:

– Observations recorded were based on the conditions (including subsurface conditions) that existed at the time of the fieldwork.
– Locations and target depths for the recovery and groundwater bores were selected by CSE in advance. Where site constraints and access issues required changes to proposed locations, the amended locations were agreed between CSE and GHD. Further details of any bore location changes are detailed later in this report.
– As advised by the client, determination of the final drilled and bore installation depths were made in consultation with the CSE site hydrogeologist.

2 Fieldwork program

2.1 Fieldwork schedule

A timeline of the tasks completed during the fieldwork program is provided in Table 2.1.

Table 2.1 Timeline of the fieldworks

Activity	Dates
Site visit and services clearance	21 June 2023
Construction of drilling pits	Monday 10 July to Tuesday 11 July 2023
Drilling and bore installation, including bore development	Monday 10 July to Friday 28 July 2023
Pumping tests of 5 No recovery bores, slug tests on 5 No. monitoring bores	Tuesday 1 August to Friday 11 August 2023
Rehabilitation of drilling pits	Progressive rehabilitation during fieldwork program, completed Monday 14 August 2023
Groundwater sampling of seven monitoring bores	Monday 14 August to Tuesday 15 August 2023
Survey of bores	Thursday 3 August 2023 and Wednesday 16 August 2023

2.2 Pre-work tasks

There were several pre-mobilisation tasks that were completed prior to commencement of the fieldwork program, including:

– Project kick-off meeting
– Program scheduling
– Inductions and training
– Engagement of GHD subcontractors
– Site inspection
– Services clearance
– Preparation of Health, Safety and Environment (HSE) Plan, including JSEA
– Preparation of Environmental Management Plan (EMP)
– Sampling and Drilling Plan
– Permits and site access

2.2.1 Program scheduling

Upon award of the project, a project kick-off meeting was held (via teleconference) to discuss the project schedule, site access requirements, approvals and permitting requirements (e.g., traffic control, permits), site visit arrangements, HSE systems familiarisation, induction and training requirements, HSE documentation requirements, and confirmation on deliverables and timing.

Following the meeting, GHD prepared a delivery schedule for approval by CSE. The schedule outlined the proposed drilling program sequence and timing, as well as preparation and delivery of reports.

Weekly progress meetings were held and attended by GHD and CSE to discuss project progress, issues, incidents and progress of assigned actions.

2.2.2 Inductions and training

All GHD and subcontractor field personnel completed the CSE site inductions (e.g., online site induction, waste containment facility induction) and site access forms. GHD personnel also had other required competencies (e.g.,

first aid, etc.). Additionally, the supervising hydrogeologist had G1G8G9 (Mining Supervisor) and G2 (Carry out the Risk Management Processes) qualifications.

2.2.3 Subcontractors

GHD utilised the services of our experienced subcontractors (who are pre-qualified in GHD's system) to deliver the program, as follows:

– Services location: GeoRadar Australia
– Drilling Contractor: JAB Drilling
– Earthworks and waste management: Enviropacific Services (EPS)
– Surveyor: Fredriksen, MacLean & Associates
– Pumping test contractor: Gierke Pumps & Irrigation
– Groundwater and soil sample analysis: ALS (primary) / Eurofins (secondary)

2.2.4 Site visit and service location

Prior to drilling commencement, a site visit was undertaken on 21 June 2023, attended by representatives from CSE, GHD, JAB Drilling, and EPS to establish an understanding of the site and review the proposed locations' accessibility for the planned drilling works.

An accredited service locator (GeoRadar Australia) also attended the site visit to undertake utility clearance of the proposed 14 No. drilling locations, using an electro-magnetic induction scanner and 2D ground penetrating radar, with reference to Before You Dig Australia (BYDA) and other available service plans as provided by CSE. The services clearance report is included in Appendix A.

As a result of the site inspection, one proposed offsite borehole location (MW93) was relocated to onsite and renamed to MW98 and others relocated to more accessible locations, as detailed below in Table 2.2.

Table 2.2 Details of bore relocation and modifications to program

Bore ID	Constraint	Details of relocation
MW93	Cannot access proposed location. Vegetation too dense and terrain too rough.	Bore relocated to onsite location and re-labelled as MW98.
MW83	Location is next to the Eastern Seepage Drain, too steep and not enough room between the road and the drain.	Relocated to the northern side of the road at the base of the embankment for the Ash Dam.
MW87	Located on Powerlink Queensland owned land. No access to site	Borehole not drilled due to no access to property. Bore to be potentially relocated and drilled at later date. Relocation to be confirmed
MW88	Located on Powerlink Queensland owned land. No access to site	Borehole not drilled due to no access to property. Bore to be potentially relocated and drilled at later date. Relocation to be confirmed
MW92	Located on Powerlink Queensland owned land. No access to site	Borehole not drilled due to no access to property. Bore to be potentially relocated and drilled at later date. Relocation to be confirmed

The final locations of the newly installed bores are shown on Figure 3.1.

2.2.5 Sampling and drilling plans

In consultation with CSE, GHD prepared a sampling, analysis and quality plan (SAQP) for the scope of work, inclusive of a drilling plan, to outline the project objectives, fieldwork methodology, sampling schedule, analytical schedule, and quality assurance and quality control (QA/QC) procedures.

The QA/QC procedures were based on NEPC (2013) measures and PFAS NEMP 2.0 (HEPA 2020). QA involves all the actions, procedures, checks and decisions undertaken to ensure the representativeness and integrity of samples and accuracy and reliability of analytical results (ASC NEPM). QC involves protocols to monitor and measure the effectiveness of QA procedures.

The drilling plan included details for the drilling work including specification for the construction of both the recovery and monitoring bores. The drilling plan included an Inspection and Testing Plan (ITP) template for approval by CSE.

2.2.6 HSE documentation preparation

Fieldwork preparation included a project-specific risk assessment and hazard management program, documented in a HSE Plan, which was provided to CSE for approval prior to site mobilisation.

The HSE Plan identified foreseeable hazards associated with site works, and addressed how the hazards were to be managed using a risk assessment framework. The HSE Plan defined the processes for site safety, required inductions, procedure for emergencies, procedure for incident reporting, vehicle and equipment inspections, management of chemical, journey management and check-in procedures. The HSE Plan also included a project-specific Job Safety and Environment Analysis (JSEA) and Pre-Work Assessments, synonymous with safe work method statements (SWMS) to ensure GHD and subcontractor personnel adhered to the pre-qualification checks commensurate with the works to be performed. Refer to Section 3 for a detailed outline of the HSE system that was implemented on this project.

The field team retained all safety documentation (JSEA, pre-work assessments, registers, records, forms), which were filed at the end of the fieldwork program.

2.2.7 Environmental management plan

An Environmental Management Plan (EMP) was prepared for the project. The EMP was submitted to CSE for approval prior to mobilisation.

2.2.8 Works in a road corridor

Following receipt of tender clarification responses from CSE (received 4 April 2023), GHD understood that the proposed monitoring bores MW89 and MW91 and recovery bore MW90 were located in a road parcel (Cocups Rd parcel).

CSE consulted with Banana Shire Council (BSC) and it was determined that a road works approvals / permit and traffic management plan was not required prior to undertaking any drilling works. However, for the safety of the personnel working at location MW91, traffic controllers were engaged through EPS to manage the traffic during the pit construction, drilling, bore installation and development, headworks construction, emptying of pit and rehabilitation of pit. Work on bore MW91 was fully completed within two days to ensure minimal disruption to road users.

2.2.9 Permitting

All earthworks, drilling and bore installation, and pumping test work within the CSE site were completed under a CSE Permit to Work. All work within offsite locations was completed under GHD supervision utilising GHD's HSE management system.

3 Bore drilling program

3.1 Approach

The following section describes the tasks and methodologies undertaken during the fieldwork program for the following activities:

– Drilling pit construction and waste management
– Borehole drilling
– Soil/solid and drilling waste sampling
– Bore installation
– Bore development
– Survey

Table 3.1 provides a summary of bore locations and construction details for the 11 No. newly installed recovery and monitoring bores. This table provides information on the bore type, screen depths, screened geology of the adjacent strata and bore survey data. Figure 3.1 shows the location of the new recovery and monitoring bores.

Table 3.1 Summary of newly installed recovery and monitoring bores

Location area	Bore ID	Bore type	Screened aquifer unit	GDA94 MGA Zone 56		Natural surface elevation (m AHD)	Elevation of top of casing (m AHD)	Drilled depth (m BGL)	Screen interval (m BGL)	Date installed
				Easting	Northing					
Lower Ring Road	MW81	Recovery	Breccia / Tuff	258295.466	7304124.687	209.707	210.192	25.0	16.0 – 22.0	12/07/2023

3.2 Construction of drill pits and waste management

Due to the potential for drill cuttings and water produced during drilling being classified as a regulated waste (due to the presence of PFAS), all drill cuttings and water produced during the drilling, construction, bore development, and testing work were captured and disposed of appropriately.

The generated drilling and bore development waste was managed by EPS. At each of the drill locations a HDPE-lined pit was constructed by EPS and their subcontractors. The typical pit arrangement is shown in Figure 3.2.

Management of the waste generally included:

– On site locations: vacuum excavation truck collected water and cuttings from the pits and disposed of the waste at the Eastern Seepage Collection Pond, located along the Lower Ring Road. The movement of the waste materials was tracked by the vacuum excavation truck operator.
– Offsite locations: cuttings, drill water, and bore development water was captured into the lined pits. A vacuum excavation truck emptied the water from the pits and into a 10,000 L storage tank that was situated within a fenced location near the offsite drilling locations. A sample of the fluid in the storage tank was submitted to ALS for analysis and EPS obtained acceptance from a regulated waste facility to accept the wastewater. A regulated waste vacuum excavation truck emptied the water tank and transported the regulated waste to Flat Filters (39375 Burnett Highway Thangool QLD 4716). The waste certificates were signed by a CSE representative.

The vacuum excavation truck logs, certified laboratory report of the water analysis, and some of the regulated waste transfer certificates are included in Appendix B. At the time of report preparation GHD were still awaiting copies for an additional two waste disposal certificates (i.e., disposal of groundwater sampling purge water and liner).

Figure 3.2 Example of a typical lined pit

At the end of the fieldwork program, the pits were rehabilitated by EPS. EPS prepared a rehabilitation report, with photos of the rehabilitated pits, included in Appendix C. Generally, the rehabilitation work included:

– The pit was emptied by the vacuum excavation truck of any remaining liquid. Wastewater from onsite pits was disposed to the Eastern Seepage Collection Pond, and wastewater from the offsite locations was collected by a regulated waste contractor and disposed to the licenced facility.
– Any remaining drill cuttings from the lined pits were temporarily stockpiled next to the pit.
– The liner was removed and stored temporarily at the laydown area. The liner was disposed by EPS to a licenced facility that accepts PFAS regulated waste.
– The open pit was filled with the drill cuttings and then the excavated material that was stockpiled near the pit, compacted, and levelled.

3.3 Borehole drilling

The drilling services were provided by JAB Drilling, with Tony Watkinson as the lead, licenced water bore driller. Onsite hydrogeological support was provided by an experienced hydrogeologist from GHD. The drilling works occurred over a three-week period.

A total of 5 No. recovery bores and six monitoring bores were drilled and installed within the CSE controlled area, and within a road reserve. Three (3) of the proposed monitoring bores were not drilled and installed (no access to property) and will be completed as part of a separate scope of work.

The boreholes were drilled using a conventional truck mounted drill rig (Investigator MK-10) with rotary air capabilities and rated beyond 100 m. Rotary air was used as the preferred method to be able to identify water strike and potential groundwater ingress and outflow features. Initially boreholes were advanced with a hand auger to confirm clearances from underground services and obtain shallow soil samples. Boreholes were subsequently completed using a blade bit through residual soils and weak saprolite, before switching to pneumatic downhole hammer in competent rock. Drill bit sizes were 100 mm and 205 mm for monitoring and recovery bores respectively.

Drill cuttings were collected every 1 m and placed into chip boxes or laid out on ground, and then photographed to provide a visual record (refer to Appendix D). The lithology of the chips was logged by the supervising hydrogeologist in accordance with Australian Standard AS1726:2017. Chips were disposed into the lined drill pit after logging and photographing were completed.

Decontamination of the drilling equipment (drill bit, stabiliser and rods that entered the borehole) was completed between each of the drilling locations which included using a pressure washer with deionised water to rinse the rods as they were tripped out of the borehole and washing the drill bit/s in a bucket of deionised water and a final deionised water rinse with a sprayer.

Details of the hydrogeological conditions encountered during drilling are provided in the borehole logs, included in Appendix D.

3.3.1 Soil and drilling chip sampling

During the drilling program samples were collected of shallow sub-surface soils, deeper sub-surface soils, drill cuttings, and cuttings from the water bearing unit at each drill location. The methodology of the soils/solids sampling and the laboratory analytical results are reported in the *Soil Sampling Report* (GHD 2023b).

3.3.2 Ground conditions encountered

Most of the chip samples logged indicated strata that was consistent with the geological descriptions for the Lochenbar Formation, as described in the Biloela 1:100,000 series geological mapping (DNRM, 2001). The Lochenbar Formation is a green-grey to purple andesitic breccia.

A summary of the groundwater conditions encountered during drilling are presented Table 3.2. Superficial materials (generally the upper 1 m to 5 m) were predominantly fine-grained, comprising variable mixtures of sandy and silty clay, and clay. Some shallow soils were either reworked residual soils, or possibly fill derived from local sources. The superficial materials were dry (unsaturated) and often included gravels and cobbles of andesite /

weathered rock. The competency of these materials increased with depth, such that blade bit refusal was achieved and the drilling method switched to downhole hammer.

Based on field observations of the drilling chips there are marked differences in the lithology between location MW81, MW82 and MW83, which are all located in relatively close proximity to each other. Observations from the drill chip samples (refer to chip photos in Appendix D) are summarised as follows:

– MW84: layers of purple andesite, grey-brown shale, purple andesite, and grey shale
– MW81: grey-green breccia / tuff
– MW82: grey-green and brown breccia, with underlying green-grey and purple-brown andesite, and grey shale

Given the variable lithological composition of the Lochenbar formation and the presence of inferred faulting in this area, it is not unusual to encounter different lithological layers in a small area.

Table 3.2 Summary of ground conditions

Bore ID	Water strike (m BGL)	Temporary borehole water level (m BGL)	Water-bearing zone depth range (m BGL)	Water-bearing zone lithology
MW81	12.0	8.57	12.0 – 25.0	Breccia / Tuff
MW82	8.5	8.6	18.4 – 23.8	Andesite
MW83	9.0	Not recorded	8.4 – 23.0	Andesite
MW84	11.0	5.6	11.0 – 18.0	Andesite
MW85	9.0	7.3	9.0 – 10.0	Andesite
MW86	Groundwater not encountered during drilling	NA	NA	NA
MW89	6.5 – 7.0	6.28	6.5 – 12.5	Shale

3.4 Bore installation

Based on the logged sample chips and interpretation of downhole conditions, and in consultation with the driller, a design for the bore was prepared by the supervising hydrogeologist. During drilling, specific attention was given to identifying water strikes and monitoring the flow rate as drilling continued to final investigation depth. This information was used in conjunction with the geological log and standing water level (SWL) to determine the interval to be screened.

The bore drilling, bore design, and installation were consistent with the NUDLC (2020) guidelines. The design and installation of each bore was subjected to the Inspection and Test Plan (ITP) approved by CSE, that documented and confirmed the installation was compliant with the guidelines.

Borehole logs of the installed bores, a photo of the chip samples, and the ITP forms are attached as Appendix D. Photographs of the completed bores are included in Appendix E.

3.4.1 Recovery bores

The following approach to recovery bore construction was undertaken and details provided in Table 3.3:

- Drilled at a diameter of 205 mm to install 150 mm (DN150) Class 9 PVC casing and a 6 m stainless steel screen with 1 mm aperture
- Washed and graded 5 mm filter pack was installed a minimum of 1 m above the slotted screen
- Bentonite seal a minimum of 1 m thick, was installed above the filter pack using 12.5 mm (0.5 inch) bentonite chips
- Top of filter pack and bentonite seal was measured to check installation depths
- Bentonite chips were allowed to hydrate prior to grouting to the ground surface
- Grout from bentonite seal to surface was installed with a 3% bentonite cement-grout mix
- Bores were completed with a surficial cement pad and lockable steel monument. Four 1.8 m star pickets were installed to provide a final installed height of 1.2 m to 1.5 m, painted yellow and fitted with plastic safety caps, installed at 1 m centres around each bore. Bore casing extended a minimum 0.4 m above ground level.

3.4.2 Monitoring bores

The following approach to monitoring bore construction was undertaken and details provided in Table 3.4:

- Drill 100 mm diameter bore to install 50 mm (DN50) Class 18 uPVC threaded casing.
- A 6 m screen comprising Class 18 uPVC machine slotted 0.5 mm aperture was installed.
- End cap was screwed in.
- Washed and graded 3 mm filter pack was installed a minimum of 1 m above the slotted casing for all monitoring bores.
- Bentonite seals of a minimum thickness of 1 m was installed above the filter pack using 12.5 mm (0.5 inch) bentonite chips.
- Bentonite chips were allowed to hydrate prior to grouting to the surface.
- The top of filter pack and of the bentonite seal was measured to check installation depths.
- Grout for the bores from the bentonite seal to surface was installed using a 3% bentonite cement-grout mix.
- Bores were completed with a surficial cement pad and lockable steel monument. Four 1.8 m star pickets were installed to provide a final installed height of 1.2 m to 1.5 m, painted yellow and fitted with plastic safety caps, installed at 1 m centres around each bore. Bore casing extended a minimum 0.4 m above ground level.

3.5 Bore development

The groundwater bores were developed by JAB Drilling after completing the installation (after waiting minimum 24 hours after grouting). Each of the newly installed groundwater bores were developed to remove residual drilling fines using compressed air injected into the bore ('air lifting') within the screened section. All development/purge water was captured in the pit and then disposed of at the CSE Eastern Seepage Collection Pond. Airlifting yields and development records are summarised in Table 3.5.

Table 3.5 Development records and airlifting yields

Bore ID	Screened depth (m BGL)	Screened lithology	Final airlift yield (L/s)	Development date	Development duration (min)
MW81	16-22	Breccia/tuff, with limonite-calcite bands	1.3	03/08/2023	70
MW82	18-24	Andesite	6.8	05/08/2023	80

MW98	12-18	Shale	0.05	05/08/2023	35

During development the field physicochemical parameters were measured and recorded (pH, electrical conductivity (EC), temperature, redox potential) by the supervising hydrogeologist. Bore development records are provided in Appendix F.

Bore development was carried out until field chemistry parameters stabilised and water was clear of drilling fines, with the exception of recovery bore MW85. The yield of MW85 was very low with minimal water entering the bore to be able to adequately flush the gravel pack and casing of drilling fines. The poor development result was confirmed when groundwater sample results were reviewed, where the groundwater indicated elevated pH, calcium, alkalinity (hydroxide and carbonate as CaCO3) inconsistent with the water quality from all the other sampled bores. Refer to the GHD *Groundwater Sampling Report* (2023) for further details. MW85 would benefit from further development effort utilising different development techniques (e.g., combination of surging, bailing, pumping, and lifting).

It was noted after the completion of the development that the EC readings appeared to be incorrect, later confirmed when comparing water quality result from the groundwater sampling), and therefore the EC readings for the development should not be relied upon.

3.6 Survey

On completion of the bore drilling and installation program, GHD's appointed surveyor (Fredriksen, MacLean & Associates) surveyed the newly installed groundwater monitoring and recovery bores for accurate location information. The bore survey consisted of measuring the top of casing and natural ground surface horizontal coordinates and elevations using RTK GNSS equipment (Trimble R12 receivers) with an expected accuracy of measurements of ±10 mm horizontally. The bore collars were levelled by a precise digital level (Leica DNA03) with an accuracy of ±1 mm/km. Bore coordinates were reported in GDA94 MGA Zone 56 and reduced levels (RL) measured in m AHD. Bore coordinates and elevation records are provided in Appendix G.

4 Aquifer testing

A program of slug testing of the monitoring bores, and pumping tests on the recovery bores was undertaken. The methodology and testing results are presented in this section.

4.1 Slug testing

4.1.1 Method

Falling and rising head slug tests were completed in five monitoring bores using a solid Waterra slug, utilising data loggers to monitor the water level recovery.

A Solinst Levelogger was lowered to approximately 5 m below the measured water level, which left enough space below the base of the anticipated slug deployment level. The data logger was programmed to collect rapid measurements of water level changes within the first few seconds of water displacement through to anticipated near to full recovery (90% pre-disturbance water level).

Once the data logger was deployed, the water level was measured and recorded on the field record sheet. The slug was lowered to the measured water level, then rapidly inserted in a quick, but controlled and smooth fashion so that the slug was fully submerged below the standing water level (falling head test). The water level was then measured again over time until the bore water level had recovered. One the water level had recovered the slug was then rapidly removed from the bore (rising head test) and similarly water level measurements recorded.

The slug test equipment (solid slugs, cords, shackles, and logger) was decontaminated between use in each bore by cleaning with potable water containing Liquinox, then triple-rinsed in deionised water.

The slug testing was completed with reference to Australian Standard AS 2368–1990 *Test pumping of water wells.*

4.1.2 Results

The slug test data were analysed using AQTESOLV, a commercial aquifer test software package (Duffield, 2007). Appropriate slug test solution methods were used to determine in situ aquifer hydraulic conductivity (K).

A summary of the slug test analysis results is presented in Table 4.1. Graphical results of the slug tests are provided in Appendix H.

Table 4.1 Slug test details and results

Bore ID	Screened geology	SWL (m bTOC)	Test type	Test No.	Maximum displacement (m)	Hydraulic conductivity (K) m/d	Analytical solution
MW84	Andesite	6.32	Falling head test	Test 1	0.7	2.6	Bouwer-Rice
			Rising head test	Test 1	1.1	3.6	Bouwer-Rice
			Falling head test	Test 2	0.8	3.7	Bouwer-Rice
			Rising head test	Test 2	1.3	3.6	Bouwer-Rice
MW89[(1)]	Shale	7.52	Rising head test	Test 1	0.5	0.2	Bouwer-Rice
MW91	Andesite	9.97	Falling head test	Test 1	0.45	7.7	Springer-Gelhar
			Rising head test	Test 1	0.7	7.7	Springer-Gelhar
MW94	Andesite / Tuff / Shale	9.53	Falling head test	Test 1	0.45	8.7	Bouwer-Rice
			Rising head test	Test 1	0.5	8.7	Bouwer-Rice
			Falling head test	Test 2	1.0	8.8	Bouwer-Rice
			Rising head test	Test 2	1.3	8.7	Bouwer-Rice

Bore ID	Screened geology	SWL (m bTOC)	Test type	Test No.	Maximum displacement (m)	Hydraulic conductivity (K) m/d	Analytical solution
MW98[2]	Shale	9.45	Falling head test	Test 1	0.7	0.00046	Bouwer-Rice
			Falling head test	Test 2	0.6	0.00088	Bouwer-Rice
			Rising head test	Test 2	0.6	0.00036	Bouwer-Rice

Table notes:

1. Only the rising head test was analysed, as the screen was partially saturated.
2. Construction of the bore has the filter pack extending above the saturated zone, therefore the initial slug test data points show the response to the filter pack, which has been disregarded. The line has been fitted along the long-term recovery rather than the initial displacement response.

The slug testing of the monitoring bores has yielded a relatively broad range of hydraulic conductivity, and this can be the case with fractured rock aquifers. Without having a larger data set of bores, it is difficult to assess what the average hydraulic conductivity of the fractured rock aquifer is. The number and nature of the fractures intersected by the bore can significantly influence the hydraulic conductivity estimates. For example, the lower hydraulic conductivity derived from bore MW98 may reflect the shale being very tight and massive, compared to the andesites.

The low yielding nature of the recovery bores, and transmissivity estimates being generally less than 2 m^2/day (refer section 4.2 below) support the fractured rock aquifer having a low hydraulic conductivity.

4.2 Pumping testing

4.2.1 Approach

A pumping test was completed on each of the 5 No. recovery bores, which included a step test followed by a constant rate test. Water level monitoring (via data logger) was conducted in up to four selected observation bores located close to the pumped recovery bore (refer to Figure 3.1 for bore locations).

The methodology for the step drawdown test and constant rate test is outlined below. A photo of the general pumping test setup is shown in Figure 4.1. The step test was undertaken to guide the selection of a flow rate for the constant rate testing.

Figure 4.1 General pumping test setup (location MW90)

First – Step drawdown test

- Water levels and depths of the selected observation bores were measured and recorded on the field record sheet. Data loggers were installed in the selected observation bores.
- Pumping test equipment and data loggers were installed in the recovery bore.
- Initial conditions were established by measuring the standing water levels in the pumped bore and observation bores for a period of time before the pumping test started. Note: If water levels in the aquifer changed due to recharge or other bores pumping, the commencement of the constant rate test was delayed until water level response stabilised.
- The pump was turned on and flow set at the first minimum of three step wise increasing flow rates. Each step lasted a minimum of 30 min and up to 1 hour each. A measurement of the flows and water levels were regularly recorded.
- The drawdown was consistently monitored via a direct read cable from the data logger connected to the laptop. Drawdown was reviewed toward the end of each step, and a decision was made for the next increase in flow rate. The flow rate was adjusted upward accordingly, ensuring that sufficient water remained above the pump. Where the available drawdown was exhausted (i.e., water level reached the pump intake level), the pump was turned off.
- Throughout each step, an accurate control on flow rates was maintained. Regular observations of water quality (sediment load, turbidity, cloudiness) and field water quality parameters (e.g., EC, temperature, dissolved oxygen (DO), Redox) were made throughout the testing.
- When the last step was complete, the pump was shut down and the recovery was monitored until at least 90% pre-disturbance water levels were achieved.
- Based on the results of the step test the constant rate test flow rate was determined.

Second – Constant rate test

- The constant rate test was started after allowing at least 90% recovery after the step test. Generally, the bore was left overnight to recover. In most cases the bore had fully recovered prior to commencing the constant rate test.
- Initial conditions were established by measuring the standing water levels in the pumped bore and observation bores for a period of time before the pumping test started. Note: If water levels in the aquifer changed due to recharge or other bores pumping, the commencement of the constant rate test was delayed until water level response stabilised.
- The bore was pumped at the selected flow rate and held for at least 4 hours, and in some cases up to 10 hours.
- Manual readings of the water level were taken periodically throughout the pumping test to confirm the water level measurements by the data loggers, and the field water quality was monitored periodically throughout the test.
- Water samples for laboratory analysis were collected within the first hour, and again within the last hour, prior to pump shut down.
- Upon shut down, recovery was monitored until at least 90% pre-disturbance water levels were achieved, prior to pumping test equipment removal.
- If the pumping bore went dry (i.e., the maximum available drawdown was exhausted), the pump was shut off and recovery monitored.

The pumping test program was completed as per the DPIE (2019) minimum requirements. On site supervision of the step test and constant rate test at each bore site was undertaken by GHD's appointed supervising hydrogeologist to monitor the testing and assess the data to determine the pumping rates and provide advice for adjustments to pumping testing based on the behaviour of the bore.

All water produced from the pumping tests was diverted to the Eastern Seepage Drain for onsite locations and directed to a 10,000 L water tank at bore MW90 (offsite location). Further details on the management of the wastewater are provided in Section 3.2.

4.2.2 Summary of testing completed

A summary of the pumping test program has been provided in Table 4.2. Review of climate observations from BOM climate station 039089 (Thangool Airport) indicated that no rainfall occurred during the testing period, i.e., no recharge during the pumping test period.

Table 4.2 Pumping test summary

Bore ID	Test Type	Date start	Duration (min)	Flow rate (L/s)	Bores monitored	Radial distance[1] (m)	Drawdown (m)
MW81	Step	3/8/2023	60	0.6, 1.0, 1.5, 2.0	MW81	0.0	Three steps completed. 7.5 m drawdown in fourth flow rate step.

					MW91	85	No obvious drawdown

Table note:

1. Radial distance from pumping bore.
2. Values in parenthesis represent duration of flow rate (min).

4.2.3 Results

General

In terms of conceptualisation the pumping bores intersect the Lochenbar Formation, which predominantly comprises andesites, and forms a fractured rock aquifer system. A fault has been interpreted on the eastern side of the ash pond (Daniell 2022).

In general terms, most of the recovery bores intersected a thin sequence of fine grained materials (typically 1 m to 5 m in thickness) overlying fractured rocks which increased in competency with increasing depth. The upper 0.5 m represent fill materials or reworked residual soils, whilst the remainder of the upper fine grained sequence comprised saprolitic / weathered rock, e.g., silty and sandy clays to clays, commonly with gravels and cobbles of less weathered rock. These materials were logged as being dry, and were weak, given that they were easily penetrated with a blade bit. In most locations, the standing water level was marginally shallower than the recorded water strike (refer Table 3.2). Compressed air drilling in low permeability materials can mask the true water intersection as it can dry cuttings if seepage rates are low.

Under these circumstances, the aquifer is conceptualised as an unconfined system. The pumping test data was analysed using a number of numerical and graphical solutions to the transient well equation, with the objective to determine representative aquifer hydraulic parameters of transmissivity and storativity. Initially confined methods, e.g., Thies and Cooper-Jacob approaches were applied as early time responses can be related to elastic storage, however, to improve curve matches, alternate aquifer model approaches were applied, e.g., Neuman unconfined model. Inspection of pumping test drawdown responses did not identify an obvious delayed yield response, which may be related to the short duration of the testing.

Bore MW81

Aquifer response to pumping has been provided in Appendix I for the pumping bore MW81 and the two observation bores, MW82 and MW84. The two observation bores exhibited no obvious response to pumping, indicating that the pumping radius of influence had not extended over 70 m during the approximate 7.8 hrs of constant rate pumping at 1.6 L/s. Calculation of an aquifer storage value was therefore not undertaken.

Water levels were around 8.1 m BGL at the commencement of pumping and were drawn down 6 m to 14 m BGL at the completion of pumping. The pump intake was set at 20.88 m which was approximately 1 m off the total constructed depth. The drawdown response was relatively smooth, and the bore recovered greater than 90% following the cessation of pumping.

Field water quality parameters were recorded from the discharge and have been shown in Appendix I. Most of the field parameters remained relatively stable throughout the pumping, however, the ORP showed a gradual declining trend, i.e., becoming more reduced.

The data from pumping bore MW81 was initially analysed using the Theis and Cooper-Jacob solutions, however, there was a poor match to both the drawdown and derivative data, indicating that these (confined aquifer) models did not accurately reflect the behaviour of the unconfined aquifer system. An improved match to the drawdown and form of the derivative data was obtained using the Neuman model, which was applied to the drawdown data, and the recovery data, with the latter being completed using the Agarwal (1980) transformation. The transmissivity derived from these approaches was 3 m^2/day and 0.4 m^2/day (recovery data). It is noted that the delayed yield effect was not evident in the drawdown response.

Bore MW82

Aquifer response to pumping has been provided in Appendix I for the pumping bore MW82 and the observation bore MW84. The observation bores exhibited no obvious response to pumping, indicating that the pumping radius of influence had not extended over 145 m during the approximate 10 hrs of constant rate pumping at 2.4 L/s. Calculation of an aquifer storage was therefore not undertaken.

Water levels were around 7.9 m BGL at the commencement of pumping and were drawn down 8.4 m to 16.3 m BGL at the completion of pumping. The pump intake was set at 22.4 m which was approximately 1 m off the total constructed depth. The drawdown response was relatively smooth, and the bore recovered greater than 90% within a few hours following the cessation of pumping.

The data from pumping bore MW82 was initially analysed using the Theis and Cooper-Jacob solutions, however, there was a poor match to both the drawdown and derivative data, indicating that these models did not accurately reflect the behaviour of the conceptualised unconfined aquifer system. An improved match to the drawdown and form of the derivative data was obtained using the Neuman model, which was applied to the drawdown data, and the recovery data, with the latter being completed using the Agarwal (1980) transformation. The transmissivity derived from these approaches was 0.8 m^2/day and 0.85 m^2/day for the pumping and recovery data respectively. It is noted that the delayed yield effect was not evident in the drawdown response.

Water quality was monitored during the step drawdown test, and this indicated that the SPC, pH and ORP were all declining during the pumping test. Water quality was also monitored during the constant rate test which indicated that SPC, pH and ORP were all declining, consistent with the step test monitoring.

Bore MW83

Aquifer response to pumping has been provided in Appendix I for the pumping bore MW83 and the two observation bores ESC1 and MW83. Bore ESC4 was not used as an observation bore, as previous pumping from existing recovery bores had affected the water level. The nearest observation bore, bore ESC1 exhibited no obvious response to pumping, however, bore MW85 showed a partial recovery response during the test. This response is unusual and seems unrelated to the pumping of bore MW83. Bore MW85 is screened at shallower interval relative to pumping bore MW83 and is further remote from the bore relative to the other observation bore ESC1. The Noordbergum effect can result in water level rises in overlying aquifer, however, it is unusual that it has not been identified in nearer bores, and in fractured rock terrain. It is possible that pumping from nearby existing recovery bores had impacted the water level in bore ESC4. As a consequence, data from bore ESC4 has not been applied in the analysis.

As there was no obvious movement in bore ESC1, the pumping radius of influence has not extended over 55 m after 3 hrs of constant rate pumping at 1.7 L/s. Calculation of an aquifer storage was therefore not undertaken.

Water levels were around 6.3 m BGL at the commencement of pumping and were drawn down 7.6 m to 14 m BGL at the completion of pumping. The pump intake was set at 21.9 m which was approximately 1 m off the total constructed depth. The drawdown response was relatively smooth, and the bore recovered greater than 90% within a few hours following the cessation of pumping.

The data from pumping bore MW83 was initially analysed using the Theis and Cooper-Jacob solutions, however, there was a poor match to both the drawdown and derivative data, indicating that these models did not accurately reflect the behaviour of the unconfined aquifer system. An improved match to the drawdown and form of the derivative data was obtained using the Neuman model, which was applied to the drawdown data, and the recovery data, with the latter being completed using the Agarwal (1980) transformation. The transmissivity derived from these approaches was 2.5 m^2/day and 1.1 m^2/day for the pumping and recovery data respectively. Match to both drawdown and derivative data was considered better for the recovery data, i.e., this is considered a more reliable estimate. It is noted that the delayed yield effect was not evident in the drawdown response.

Water quality was monitored during the step drawdown test, and this indicated that the DO and ORP were both declining during the pumping test. SPC and pH were generally stable throughout the duration of pumping.

Bore MW85

Bore MW85 did not yield much during drilling and the bore rapidly dewatered at a flow rate of 0.1 L/s. The aquifer response to pumping has been provided Appendix I. Owing to the short duration of pumping, no drawdown response was observed in the monitoring bores.

Although the bore was dewatered after 18 mins of pumping, recovery data was obtained from the pumping bore. A transmissivity of 0.02 m^2/day was derived from the bore, however, this is considered to be of low reliability. This is because it was obtained using the Theis recovery method, and other bores analysed at the site do not respond as a Theissian aquifer, i.e., the aquifer does not behave a 'model' confined aquifer.

Bore MW90

Aquifer response to pumping has been provided in Appendix I for the pumping bore MW90 and the three observation bores, MW89, MW43 and MW91. The three observation bores exhibited no obvious response to pumping, indicating that the pumping radius of influence had not extended over 28 m over the approximate 4.5 hrs

of constant rate pumping at 0.21 L/s, and 4 hrs at 0.3 L/s. Calculation of an aquifer storage was therefore not undertaken.

Water levels were around 6.7 m BGL at the commencement of pumping and were drawn down 4 m to 11 m BGL at the completion of pumping. The pump intake was set at 26 m which was approximately 1 m off the total constructed depth. Owing to the small drawdown initially, the flow rate was increased from 0.21 L/s to 0.3 L/s in order to stress the bore. The drawdown response was relatively smooth, and the bore recovered greater than 90% within a few hours of the cessation of pumping.

The data from pumping bore MW90 was initially analysed using the Theis and Cooper-Jacob solutions, however, there was a poor match to both the drawdown and derivative data, indicating that these models did not accurately reflect the behaviour of the unconfined aquifer system. An improved match to the drawdown and form of the derivative data was obtained using the Neuman model, which was applied to the drawdown data, and the recovery data, with the latter being completed using the Agarwal (1980) transformation. The transmissivity derived from these approaches was 1.3 m^2/day and 0.87 m^2/day for the pumping and recovery data respectively. It is noted that the delayed yield effect was not evident in the drawdown response.

Water quality was monitored during the constant rate test, and this indicated that the DO and ORP were both fluctuating but overall had an increasing trend. SPC and pH were generally stable throughout the duration of pumping.

A short duration step test was attempted on bore MW90, however, it was not successfully completed. The bore was initially pumped at 0.2 L/s for 55 min and this consumed approximately 3 m of drawdown. When the flow rate was increased to 0.3 L/s, the drawdowns in the bore fell rapidly to 11 m and did not appear to be stabilising. The flow rate was backed off to 0.15 L/s which resulted in some recovery within the bore.

5 Conclusions

Field investigations were undertaken to characterise the ground conditions on the southern embankment of the Callide Ash Dam. The program resulted in the construction 5 No. (DN150) recovery bores and an additional 6 No. monitoring bores (DN50). Bore construction was consistent with the NUDLC (2020) minimum requirements.

Each of the bores intersected the fractured rock aquifer, which largely comprised andesitic rocks, and shale in the western locations. Bore yields determined from air lift development indicated a range of 0.1 L/s to 2 L/s. Aquifer slug testing was undertaken on monitoring bores and hydraulic conductivities ranged from $3.6x10^{-4}$ m/day to 9 m/day.

Recovery bores underwent step drawdown and constant rate testing. Bore MW85 was low yielding and could not sustain flow rates greater than 0.1 L/s. Bore MW90 was marginally better, producing 0.3 L/s. Recovery bores MW81, MW82 and MW83 sustained flow rates over 1.5 L/s. As obvious movement in monitoring bores was not identified, aquifer storage coefficients could not be determined from the testing. Derivation of storage coefficients would require either a) a longer duration pumping test or b) time-series of water level monitoring data. Aquifer transmissivities ranged from 0.3 m^2/day to 3 m^2/day.

GHD makes the following recommendations:

– The monitoring bores should be incorporated into the CSE monitoring program.
– Until they are equipped with production pumps, the recovery bores should also be added to the monitoring program. Following equipping, recovery bore monitoring requirements should be reviewed to inform their operation, e.g., metering, drawdown, flow rates etc.
– MW85 would benefit from further development effort utilising different development techniques (e.g., combination of surging, bailing, pumping, and lifting).
– A maintenance program is implemented to protect your recovery and monitoring bores and further details have been provided in Appendix J.

Name of Receiving Facility: FLAT FILTERS

Address: 3937 BURNETT HWY THANGOOL — Postcode: 4716

ABN/ACN: — Disposal/Treatment Code: D12 — Physical Nature: L — Waste Code No: M270

Discrepancy: ☐ Waste Type ☐ Volume Received ☐ Transporter Details ☐ Other

Environmental Authority No.: EPPR02422414 — Amount of Waste: 5000 — ✓ Litres ○ Cubic Metres ○ Kilograms

If applicable I am acting as an agent for the Generator ☐

I acknowledge the receipt of the waste described in part 1.

(Name and Position) — Phone No.

CERTIFICATE OF ANALYSIS

Project	: 12609270	Date Samples Received	: 01-Aug-2023 10:10
Order number	: ----	Date Analysis Commenced	: 02-Aug-2023
C-O-C number	: ----	Issue Date	: 04-Aug-2023 12:24
Sampler	: Brian Llewellyn		
Site	:		
Quote number	: EN/005		
No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X-SUT PFAS Super Ultra Trace: The high recovery laboratory control standard for 10:2 FTS is deemed acceptable as associated results are less than the limit of reporting.
- EP231X-LL(TOP) PFAS TOPA: Sample 'TANK_01' (EB2323207-001) required dilution due to matrix interferences. LOR values have been adjusted accordingly. The LOR of PFOS has been raised further due to additional matrix interferences.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

Figure D.1 Bore MW81 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW81
Easting / Northing	
Start date	12-7-23
Finish date	20-7-23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA
	Install casing and the ~~attached~~ tremie line		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW82
Easting / Northing	
Start date	13.7.23
Finish date	20.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA
	Install casing and the attached ~~tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW84
Easting / Northing	
Start date	MW84 11.7.23
Finish date	20.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		BL
	Suitable for drilling and construction	MW	
Assignment of licensed water bore driller	Licensed water bore driller present on site	MW	
	Water bore licence sighted by GHD		BL Qld. Class 1
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site	MW	
	GHD completed a checklist on construction materials		BL
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		BL
	Correct casing is at the drilling location and is laid out	MW	
	GHD confirmation correct casing is on-site		BL
	Field test for hydration of bentonite pellets		BL
	Measure and record the casing lengths		BL
	Mark the casing length for the location of the tremie pipe		BL. NA
	Install casing and the attached tremie line	MW	
Installation of annulus materials	Install gravel pack and measure the installation depth	MW	
	Install the bentonite seal and measure the installation depth	MW	
	Allow the bentonite seal to hydrate	MW	

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL.
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL.
	Install head works		
	Head works observed to be installed		BL.
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL.
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL.
Completion	Bore successfully completed. Suitable for intended purpose		BL.

Drilling Subcontractor	JAB	Tony W	Licenced Water Bore Driller	

Construction notes Bore constructed as asked

Notes
On completion of drilling to 40m it was noticed that water was flowing into the bore. JAB (Tony) used portable bore camera to locate water entering the bore at 10m depth.
Decided to cover this depth with screen of 9.5m to 15.5m
Development problems due to air pushing the low flow back into formation with minimal to no flow at collar.
Suggest develop with small pump

Job No. 12609270

Figure D.6 Bore MW86 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW86
Easting / Northing	
Start date	18.7.26
Finish date	20.7.26

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		—
	Install casing and the attached tremie line		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Job No. 12609270

Figure D.9 Bore MW91 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW91
Easting / Northing	
Start date	26.7.23
Finish date	

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA
	Install casing ~~and the attached tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~	~~JAB~~	
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works	TW	
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water	TW	
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)	TW	
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose	TW	BL

Acknowledgement of successful bore installation

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW98
Easting / Northing	
Start date	18-7-23
Finish date	20-7-23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		BL.
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		BL.
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		BL.
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		BL.
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		BL.
	Field test for hydration of bentonite pellets		BL.
	Measure and record the casing lengths		BL.
	Mark the casing length for the location of the tremie pipe		NA.
	Install casing and the ~~attached tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Acknowledgement of successful bore installation

	Organisation	Person	Role	Acknowledgement - signature
Client Representative				
Supervising Hydrogeologist	GHD	B. Llewellyn	Supervisor	B. Llewellyn
Drilling Subcontractor	JAB	Tom/W	Licenced Water Bore Driller	

Construction notes

Notes
BORE CONSTRUCTED AS ASKED NOT AS ADVISED

Appendix E

Photographic log

MW81 – Recovery bore

Pumping test setup

MW82 – Recovery bore

MW83 – Recovery bore

MW84 – Monitoring bore

Measuring approximate flow from the borehole during drilling

MW85 – Recovery bore

Client:	**CS Energy**	**GHD Personnel:**	**Brian Llewellyn**

Bore details		**Pre-development details**		**Post-development water level details**	
Total casing stickup (m agl)	0.712	**Pre-dev SWL (m bTOC)**	5.66	**Post-dev SWL (m bTOC)**	6.09
Screen interval (m bgl)	9.5-15.5	**Water in casing (m)**	7.7	**Date**	5/08/2023
Total bore depth (m bgl)	13.51 m BTOC	**Vol. water in casing (L)**		**Time**	10:00
Casing internal diameter (mm)	146	**Development method**	Air lift		

Bore development water quality observations

Date / Time	Yield L/sec	DO %S	DO ppm	SPC @ 25° uS/cm	EC mS/cm	TDS ppm	pH	Redox mV	Temp C	Comments (colour, turbidity, sediment load, odour, other)
20/07/2023 12:05										Started developing at 12:05. Minimal grey cloudy water returning. Flow during drillling was approx. flow 0.2 L/s. Water was not air lifting from bore, as air was pushing water back into the screen. Bore is not well developed, may need a small pump to remove water.
20/07/2023 12:10	0.01									
20/07/2023 12:30	0.02

Monitoring bore maintenance program

Groundwater Monitoring Bores – Looking after your asset.

What can go wrong?

A common misconception with monitoring bores is that once they are installed there is no further works required during their lifespan. However, implementing an asset maintenance plan can get the most value from the bore and maximise the reliability of data obtained from it.

Issue	Source	Remediation
Headworks can be damaged by slashers, vehicles, vandals, mowers	Poor identification of the bore Poor headworks security	Maintaining locking mechanisms, marker posts *Lubricants need to be environmentally compatible
Roots and clogging of bore screens	Shallow bore with screen length incorporating unsaturated zone	Root clearing with redevelopment *Herbicides need to be environmentally compatible
Subsidence of annular materials around the bore (creating a depression around the headworks)	Poor construction practice	Additional of clean fill
Ground movement damaging casing or monument	Swelling soils, mine / quarry sites	Repair to monument
Sampling equipment blocking the bore / access to the screens	Poor sampling practice	'Fishing' of lost downhole equipment
Corrosion of steel casing materials	Casing material selection Valve material selection Aggressive geological materials	Resleeve of casing Replacement of bore
Collapse by squeezing formations / inadequate collapse resistance of casing or parting of joints	Poor bore design and construction practice	Replacement of bore
Blockages by foreign objects	Poor identification of the bore Poor headworks security	Maintaining locking mechanisms, marker posts
Siltation and blockage of screens	General site operations Screen / gravel pack design	Redevelopment
Rock falls in open holes	Poor construction practice	Resleeve of borehole Replacement of bore

Groundwater Monitoring Bores – Undertaking inspections

What can you do to maintain the monitoring asset?

It is good practice to complete an inspection of the monitoring bore as part of every site visit. A number of basic checks can be undertake as summarised in the table below.

Redevelopment is recommended every 5 – 10 years

Task	Frequency		Maintenance
	Every visit	Annually	
Confirm the lock operation and locking mechanism	✓	✓	Lubricating locks, locking mechanisms
Check condition of the monument / flush mounted cover	✓	✓	Painting of monument
Check stability of the monument / flush mounted cover	✓	✓	Add additional cement where casing moves. Resurvey where datum has shifted.
Check cleanliness of locking bolt threads and O-ring seal (for flush mounted Gatic™ installations).	✓	✓	Wire brush bolts, replace as necessary
Check condition of artesian valving	✓	✓	Replace as required
Check casing for sharp edges (that could damage measuring tapes / equipment deployed in bore)	✓	✓	File casing lip
Confirm bore depth / access into the screen zone		✓	If anomalous, review and plan intrusive investigation, e.g. inspection or redevelopment
Vegetation around the bore and access to the bore.	✓	✓	Slashing, application of herbicides (subject to bore use)
Check legibility of the identification plate / label	✓	✓	Replace label
Check presence of any marker post / protective bollard	✓	✓	Replace as required
Slumping around bore	✓	✓	Addition of clean fill around bore.
Water level (only) monitoring bores		✓	Bores that are not subject to sampling disturbance should be bailed annually to confirm that water levels are reacting and recovering.

ppm	Parts per million
%S	Percent saturation

1. Introduction

GHD Pty Ltd (GHD) completed a drilling and bore installation program as part of the *Callide Groundwater Bore Drilling Project* at CS Energy Limited (CSE) Callide Power Station located near Biloela, in Central Queensland.

CSE has undertaken a series of investigative works at Callide Power Station (the 'Project site') to investigate potential impacts and risks associated with the historical use of Aqueous Film Forming Foam (AFFF) at the site. The preliminary investigations were triggered by the Queensland Government's implementation of the *Environmental Management of Firefighting Foam Operational Policy* issued in July 2016. The policy provided information on the requirements for a three-year transition period to fluorine-free foams, or alternative foams containing at least 99.5% shorter-chain per- and poly-fluoroalkyl substances (PFAS).

Subsequent investigations were commissioned by CSE in response to the Department of Environment and Science (DES) notice to conduct an Environmental Evaluation (EE) (Reference: EPPR00536313 | CCPLRC-100046232, most currently dated 21 August 2023) requiring CSE to investigate and assess the source, cause, and extent of any actual or potential environmental harm resulting from the historical use of AFFF on site.

CSE prepared a scope of work to undertake a targeted drilling and monitoring bore installation program to fulfill the requirements of the EE and to further characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises.

GHD were engaged to undertake the drilling, bore installation, and testing program. The Callide Power Station Groundwater Bore Drilling Project included the following tasks:

– Drilling and installation of five recovery bores and six monitoring bores
– Soil and drill cuttings sampling and analysis
– Pumping tests on the five recovery bores
– Groundwater sampling of newly installed bores plus one existing bore
– Survey of newly installed bores
– Reporting

The details of the field program are outlined in GHD (2023) report *Factual Bore Completion Report*.

1.1 Purpose of this report

The purpose of this report is to document the groundwater sampling methodology and summarise the results of the groundwater sampling analysis.

This report presents factual data collected and observations made during the groundwater sampling field program. This report should be read in conjunction with the *Factual Bore Completion Report* (GHD 2023a) and the *Soil Sampling Report* (GHD 2023b).

1.2 Scope and limitations

This report is subject to the limitations set out below and must be read in conjunction with each of the supporting technical reports summarised in Section 1.1, as well as the assumptions, exclusions, and qualifications within the supporting technical reports.

This report has been prepared by GHD Pty Ltd (GHD) for CS Energy Limited (CSE) for the purpose of responding to a notice to conduct an environmental evaluation issued by the administering authority pursuant to section 326B of the *Environmental Protection Act 1994* (Qld) (EP Act) (the Purpose), and not for any other purpose. The report may be used by Queensland Department of Environment and Science (DES), acting in its capacity as the administering authority (as defined in the EP Act)), and the appointed contaminated land auditor, and Luke Amies (Suitably Qualified Person) for the Purpose. GHD disclaims responsibility and liability to any person other than CSE arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally possible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

While every effort has been made by GHD to assess contamination as required by the scope of services, GHD cannot, guarantee that other issues outside of the scope of services do not remain.

GHD has prepared this report on the basis of information provided by CSE and others who provided information to GHD (including Government authorities and analytical laboratories), which GHD has not independently verified or checked beyond the agreed scope of work. Where drill hole logs, laboratory tests and similar work have been performed and recorded by others the data is included and used in the form provided by others. The responsibility for the accuracy of such data remains with the issuing authority, not with GHD. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described throughout this report. GHD disclaims liability arising from any of the assumptions being incorrect. The opinions, conclusions and any recommendations in this report are based on information obtained from site inspections and sample collection at discrete locations across the site and may not fully represent the conditions that may be encountered across the site at other than these locations. It is emphasised that the actual characteristics of the sub-surface and surface materials may vary significantly between adjacent test points and sample intervals and at locations other than where observations, explorations and investigations have been made. Sub-surface conditions, including groundwater levels and contaminant concentrations can change in a limited time. This should be borne in mind when assessing the data. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

It should be noted that because of the inherent uncertainties in the sub-surface evaluations, changed or unanticipated sub-surface conditions may occur that could affect the opinions GHD has expressed, which may need to be re-examined and changed. GHD does not accept responsibility for the consequences of significant variations in the conditions.

An understanding of the site conditions depends on the integration of many pieces of information, some regional, some site specific, some structure-specific and some experienced based. Hence, this report must be read in full and should not be altered, amended, or abbreviated, issued in part, or issued incomplete in any way without prior checking and approval by GHD.

GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

1.3 Assumptions and qualifications

The following assumptions and qualifications are made in relation to the content of this report:

– Groundwater sampling and analysis were generally carried out in accordance with the CSE-approved *Drilling, Testing, and Sampling Plan* (GHD, 2023d)

2. Methodology

2.1 Sampling locations

Groundwater sampling was completed on each of the recently installed recovery and monitoring bores plus one additional existing monitoring bore (MW78), as follows:

– Recovery bores: sampling completed during the pumping testing from 2 August to 10 August 2023
– Monitoring bores: sampling completed on 14 August to 15 August 2023

Each sampling points is shown on Figure 2.1 and the locations summarised in Table 2.1.

Table 2.1 Groundwater sampling locations summary

Location ID	Bore type	Easting (GDA94 Z56)	Northing (GDA94 Z56)	Top of casing elevation (m AHD)	Casing stickup (m)	Location
MW78	Existing bore	257791.6	7303619.9	Unknown	0.305	On site, next to new bore MW94
MW81	Recovery	258295.466	7304124.687	210.192	0.474	On site, Lower Ring Road
MW82	Recovery	258241.432	7304075.328	209.023	0.519	On site, Lower Ring Road
MW83	Recovery	257998.064	7303887.720	198.210	0.499	On site, Lower Ring Road
MW84	Monitoring	258370.406	7304141.737	213.278	0.670	On site, fire track
MW85	Recovery	258045.167	7303790.073	196.984	0.712	On site, fire track
MW86	Monitoring	257074.299	7303520.495	198.203	0.695	On site, fire track
MW89	Monitoring	258023.937	7303642.861	192.203	0.657	Off site
MW90	Recovery	258012.324	7303617.432	191.097	0.636	Off site
MW91	Monitoring	258097.269	7303613.698	193.772	0.726	Off site, Cocups Road
MW94	Monitoring	257792.558	7303623.283	194.311	0.519	On site, fire track
MW98	Monitoring	256822.495	7303493.653	190.004	0.597	On site, fire track

Table notes:
Survey of new recovery bores and monitoring bores completed by Fredriksen, Maclean and Associates. Coordinates are in GDA 94 Zone 56 and elevation is expressed in Australian Height Datum (AHD).

2.2 Sampling methodology

Groundwater sampling was carried out in accordance with the following reference documents:

– Australian/ New Zealand Standard (AS/NZS) 5667.11 – 1998 (R2016) *Water Quality – Sampling – Part 11: Guidance on sampling of groundwaters*

– Department of Environmental and Science (DES) 2018 – *Monitoring and sampling manual*

– National Chemicals Working Group of the Heads of EPAs – Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan – Version 2.0*

– National Environment Protection Council (NEPC), 2013: *National Environment Protection (Assessment of Site Contamination) Measure 1999* (ASC NEPM, as amended 2013)

Field physicochemical measurements were recorded for all groundwater samples using a calibrated YSI Pro Plus groundwater quality meter including parameters for pH, temperature, oxidation-reduction potential (ORP), dissolved oxygen (DO), specific conductance (SPC), and total dissolved solids. The physicochemical parameters were recorded periodically during purging to assess stabilisation of groundwater quality within each sampled bore. The YSI calibration certificate is provided in Appendix A.

Groundwater samples were collected into laboratory-supplied containers with preservatives appropriate for the analyte type and placed on ice in insulated containers while in the field. The samples were refrigerated at the end of each day. Samples were batched by placing into insulated containers with ice, packaged up and sent to ALS (primary laboratory) and Eurofins (secondary laboratory) under chain of custody (CoC) documentation for analysis.

2.2.1 Groundwater sampling of recovery bores

Groundwater samples from the recovery bores were collected during the pumping tests using the Grundfos pump deployed for the testing, completed between 2 August and 10 August 2023. Sampling of recovery bore MW85 was not completed during the pumping testing as the bore ran dry during the step test, and the sample was collected several days later when the bore had recovered.

Generally, one sample was collected approximately 1 to 2 hours after the constant rate test had started, and in some bores a second sample was collected within the last hour of the pumping test. The samples collected for the recovery bores are summarised in Table 2.2.

Table 2.2 Summary of sampling of recovery bores

Bore ID	Date	Time	Sample ID	QA samples	Comments
MW81	04/08/2023	09:00	MW81_PT_01	RS02_GW	Rinsate sample from Grundfos pump collected after constant rate pumping test completed on MW81 (RS02_GW, collected 05/08/2023)
	04/08/2023	15:30	MW81_PT_02	–	
MW82	07/08/2023	09:40	MW82_PT_01	FD01_GW / FS01_GW / RS01_GW	Duplicate samples taken from parent sample MW82_PT_01 Rinsate sample from Grundfos pump collected after constant rate pumping test completed on MW82 (RS01_GW, collected 07/08/2023)
	07/08/2023	16:00	MW82_PT_02	–	
MW83	02/08/2023	09:10	MW83_PT_01	–	Second primary sample was not collected as the pump was shutoff after 4 hours into the test due to an approaching lightning storm, where the Waste Containment Facility (WCF) was evacuated. Rinsate sample was not collected from Grundfos pump after use in MW83.
MW85	14/08/2023	12:00	MW85_GW	RS03_GW	Rinsate sample from Grundfos pump collected after step pumping test completed on MW85 (RS03_GW, collected 09/08/2023)

Bore ID	Date	Time	Sample ID	QA samples	Comments
					A step test was started on 09/08/2023, however the pump was shut off 16 mins after test commenced as the bore ran dry. A sample was not collected at that time. A constant rate test was not completed. The bore was later sampled by getting a grab sample with a bailer (bore was not purged prior to sampling) on 14/08/2023 after the bore had recharged.
MW90	10/08/2023	11:18	MW90_PT_01	RS04_GW	Rinsate sample from Grundfos pump collected after constant rate pumping test completed on MW90 (RS04_GW, collected 11/08/2023)
	10/08/2023	16:15	MW90_PT_02	–	

2.2.2 Groundwater sampling of monitoring bores

Groundwater sampling was completed for the newly installed monitoring bores and one existing monitoring bore (MW78). New monitoring bore MW86 was found to be dry and therefore was not sampled. A total of seven primary samples were collected between 14 August to 15 August 2023.

The samples collected for the monitoring bores are summarised in Table 2.3.

Table 2.3 Summary of sampling of monitoring bores

Bore ID	Date	Time	Sample ID	QA samples	Comments
MW78	15/08/2023	11:28	MW78_GW	–	Sampled using low-flow
MW84	14/08/2023	16:10	MW84_GW	FD02_GW / FS02_GW	Sampled via bailer Duplicate samples taken for parent sample MW84_GW
MW86	14/08/2023	14:30	–	–	Bore is dry, therefore no sample collected
MW89	15/08/2023	13:30	MW89_GW	–	Sampled via bailer
MW91	15/08/2023	14:21	MW91_GW	RS05_GW	Sampled using low-flow. Rinsate sample was collected from QED Sample Pro pump at the end of the day after sampling from MW91 was completed (RS05_GW, collected 15/08/2023)
MW94	15/08/2023	08:28	MW94_GW	–	Sampled via bailer
MW98	15/08/2023	07:05	MW98_GW	–	Bore was bailed dry on 14/08/2023 at 14:05. Left overnight to recharge and sampled the following morning via bailer

Two out of the six monitoring bores were purged and sampled using a low-flow pump (MW78 and MW91), however the pump controller malfunctioned, therefore the remaining bores were purged and sampled with a bailer. The sampling method for each is outlined as follows.

2.2.2.1 Low-flow purging and sampling method

The low-flow purging and sampling method is outlined as follows:

– The standing water level (SWL) was measured from top of casing (ToC) using an electronic dip meter.

– A QED Sample Pro bladder pump was used to purge and sample two bores (MW78 and MW91). It should be noted that Air-Met supplied equipment and consumables that were free of perfluorinated compounds, and therefore the equipment would not contaminate groundwater samples with PFAS.
– The pump utilised disposable bladders, which were replaced following pump use in each bore. The pump housing was decontaminated after each use as per the decontamination procedure outlined in Section 2.3.
– Teflon-free, dedicated, and disposable high-density polyethylene (HDPE) tubing was connected to the pump, where the air-line was connected to the MP10 controller and the water-line was connected to the flow cell.
– The pump was deployed on a hanging cable. The sample intake point was placed within the bottom half of the bore's screen interval and the flow rate was reduced to achieve a low flow sampling effect, whereby water is preferentially drawn in through the screen. This was verified by monitoring the water level during purging, to ensure excessive drawdown was not occurring.
– Field physicochemical parameters were monitored during low flow purging with a calibrated YSI Pro water quality meter.

2.2.2.2 Bailer purging and sampling method

The bailer purging and sampling method is outlined as follows:

– The SWL was measured from ToC with an electronic dip meter.
– The casing volume was calculated using the formula for a cylinder (πr^2) using the casing internal diameter multiplied by the water column (depth of bore minus water level).
– Using a single-use disposable bailer connected to a hand reel, the monitoring bores were purged the minimum purge volume (minimum 3 casing volumes, or until dry).
– During the purging process the field physicochemical parameters were monitored.
– Where a bore was purged dry the bore was allowed to recharge overnight and a sample was taken the following day with a bailer and the field physicochemical parameters recorded.

2.3 Decontamination procedure and rinsate sampling

The dip meter, the bailer reel, submersible Grundfos pump and the low-flow pump were decontaminated between sampling locations using the following procedure:

– Immersing the equipment in a bucket containing a solution of deionised water and low phosphate detergent (Liquinox®), which is confirmed as PFAS-free. A plastic scrubbing brush was used on the pump housing.
– Rinsing the equipment is a series of three buckets filled with deionised water.
– Final rinse with deionised water in a spray bottle.

One rinsate sample per day was collected from the submersible Grundfos pump and the low-flow pump following decontamination. Rinsate blanks were collected on two occasions (FB01_GW and FB02_GW). Rinsate water from ALS was supplied in 5 L bottles (one rinsate blank from each bottle).

2.4 Sample handling

Once collected, the groundwater samples were placed into ice-chilled insulated containers while in the field and then stored in a fridge. Samples were batched into insulated containers packed with ice, for transport under chain of custody (CoC) documentation to laboratories certified by National Association of Testing Authorities (NATA) for analysis.

Collection of quality assurance and quality control (QA/QC) samples included duplicates (field blank and field split), rinsates samples from the pumps, rinsate blanks for PFAS, and transport blanks for PFAS.

2.5 Analytical schedule

The analytical schedule and the collected groundwater samples are summarised in Table 2.4.

The groundwater sampling field physicochemical and laboratory results are reported in Section 3.

Table 2.4 Analytical schedule and number of collected groundwater samples

Type	Parameter	Primary samples	Duplicates (blind and split) samples	QA samples
Field physicochemical	pH, specific conductance (SPC) / electrical conductivity (EC), oxidation-reduction potential (ORP), dissolved oxygen (DO), temperature	14	2	–
Laboratory suites – Primary samples	Inorganics: pH, EC, TDS, suspended solids, major anions and cations, hardness, fluoride			
	Nutrient suite: ammonia, nitrate, nitrite, reactive phosphorus			
	Metals suite: Total and dissolved metals (Fe, Mn)			
	PFAS – Super ultra-trace long suite (28 analytes)			
	PFAS – Low level Total Oxidisable Precursor Assay (TOPA, 28 analytes)			
	Total organic fluorine (TOF)			
Rinsate	Analysis as per the Primary sample laboratory suites (excluding dissolved metals)	–	–	5
Field blanks	PFAS – Super ultra-trace long suite (28 analytes)	–	–	3
Transport blanks	PFAS – Super ultra-trace long suite (28 analytes)	–	–	2

Notes:

– Primary groundwater samples: Eight samples from recovery bores (2 x MW81, 2 x MW82, 1 x MW83, 1 x MW85, 2 x MW90). Six samples from monitoring bores (MW78, MW84, MW89, MW91, MW94, MW98).

– Duplicates: 1 duplicate sample in 10 primary groundwater samples, therefore two duplicate samples collected

– Four rinsate samples from pumping test Grundfos pump. One rinsate sample from low-flow QED Sample Pro pump.

3. Results

3.1 Relevant guidelines

The guideline values selected to compare the analytical results are listed in Table 3.1 along with the rationale for selection.

Table 3.1 Water quality guidelines assessment

Assessment	Guideline	Rationale
General water quality parameters for humans and aquatic ecosystems	Australian Drinking Water Guidelines (ADWG) 2011 Aesthetic (v3.7 updated 2022)	The ADWG 2011 was selected to assess the potential exposure of impacted groundwater to groundwater users.
	ADWG 2011 Health (v3.7 updated 2022)	
	ADWG 2011 Recreational (v3.7 updated 2022)	
General water quality parameters for aquatic ecosystems	ANZG (2018) – Freshwater – 99% (updated 26 July 2021)	Environmental Protection (Water and Wetland Biodiversity) Policy – the EPP (Water and Wetland Biodiversity) – Fitzroy Basin assigns high ecological value to Groundwaters for protection of aquatic ecosystems. Therefore the ANZG 2018 Freshwater 99% was selected to assess water quality on aquatic ecosystems.
PFAS for human and aquatic ecosystems exposure	PFAS NEMP 2.0 2020 – Health drinking water	The PFAS NEMP 2.0 was selected to assess potential exposure of PFAS-impacted groundwater to groundwater users and aquatic ecosystems. Health drinking water and Recreational water was selected to assess risk to humans from consumption and exposure to impacted water. For contaminants that are bioaccumulative the Water Quality Guideline Framework[1] specifies that the 99% species protection DGV is used, however the 99% species protection is just above the laboratory LOR, therefore any detect of PFAS exceeded the guideline value (every sample). Therefore the 95% species protection has been selected.
	PFAS NEMP 2.0 2020 – Recreational water	
	PFAS NEMP 2.0 2020 – Freshwater – 95% - slightly to moderately disturbed systems	

3.2 Groundwater purging

Results of the purging are summarised in Table 3.2, and the purging and sampling sheets are included in Appendix B.

Table 3.2 Summary of bore purging prior to sampling

Bore ID	Casing diameter (mm)	Water column (m)	Casing volume (L) (x3)	Volume purged (L)	Purged and sampled via
MW78	125	14.2	174.8 (522.5)	15	Low-flow pump
MW81	147	13.4	227.3 (681.9)	5,887 (sample 1) 45,987 (sample 2)	Grundfos pump
MW82	147	16.6	281.6 (844.8)	17,190 (sample 1)	Grundfos pump

[1] https://www.waterquality.gov.au/anz-guidelines/guideline-values/default/water-quality-toxicants/localconditions#bioaccumulation.

Bore ID	Casing diameter (mm)	Water column (m)	Casing volume (L) (x3)	Volume purged (L)	Purged and sampled via
				74,059 (sample 2)	
MW83	147	17.3	293.7 (880.4)	430	Grundfos pump
MW84	50	12.4	24.3 (73.0)	90	Bailer
MW85	147	10.6	179.8 (539.4)	261	Grundfos pump
MW86	50	Bore dry	NA	NA	NA
MW89	50	4.1	8.0 (24.1)	42	Bailer
MW90	147	20.9	354.5 (1063.6)	2,000 (sample 1) 5,000 (sample 2)	Grundfos pump
MW91	50	8.8	17.3 (51.8)	16	Low-flow pump
MW94	50	15.9	31.2 (93.6)	95	Bailer
MW98	50	9.1	17.9 (53.6)	43 (purged dry)	Bailer

3.3 Groundwater sampling results

3.3.1 Physicochemical field vs laboratory parameters

The physicochemical parameters collected in the field and laboratory results are included in the results summary tables in Table B1 in Appendix C. A summary of pH and SPC/EC are provided in Table 3.3.

Table 3.3 Physicochemical field and laboratory parameters

Sample ID	Field pH	Lab pH	Field SPC	Lab EC
MW78_GW	7.03	8.17	11,408	11,600
MW81_PT_01	6.79	7.56	7,021	6,600
MW81_PT_02	6.76	7.44	7,062	6,640
MW82_PT_01	7.32	7.69	10,237	10,500
MW82_PT_02	7.29	7.93	10,099	10,200
MW83_PT_01	6.9	7.25	8,145	8,400
MW84_GW	6.73	7.33	5,836	5,560
MW85_GW	11.59	12.0	9,786	10,400
MW89_GW	6.8	7.30	7,928	7,620
MW90_PT_01	6.74	7.94	8,602	9,430
MW90_PT_02	6.76	7.90	8,570	9,120
MW91_GW	6.88	7.49	3,548	3,430
MW94_GW	7.07	7.65	11,437	11,300
MW98_GW	7.43	7.93	8,096	7,700

The field and laboratory reported pH for water from MW85 are inconsistent with the pH readings in all other sampled bores. It is noted that there was difficulty with the airlift development of MW85 due to the very low yield of the bore and not being able to lift all the water out of the bore (i.e., water was being pushed back into the screen) (refer to the GHD *Factual Bore Completion Report* for further details). The high pH is therefore likely a result of bentonite / grout contact with the water in the bore. The water quality results for MW85 should be treated with caution.

3.3.2 Laboratory analysis results

The analytical results for groundwater samples collected from the recovery and monitoring bores are presented in Table B1 in Appendix C. Major anions and cations and fluoride

Inorganic analytes

Suspended solids

Bores that had visible colouration and suspended solids during the purging process, reported total suspended solids in the laboratory results, ranging from 10 mg/L (MW85_GW) to 654 mg/L (MW98_GW).

pH

pH values were typically neutral for all samples, ranging from pH 6.73 to 7.43, except for MW85_GW which reported laboratory pH of 11.59. The very low yield in recovery bore MW85 did not allow for the bore to be developed well which may have attributed to this result.

Major ions

Major ions ionic balance ranged from 0.03 % (MW98_GW) and 5.51 % (MW85_GW), indicating that the majority of ions present in the samples are accounted for in the major ions and minor ions (fluoride). Piper tri-linear plot of the major ions is shown in Figure 3.1.

The laboratory reported results for MW85 showed elevated calcium, potassium, alkalinity (carbonate as $CaCO_3$ and hydroxide as $CaCO_3$) concentrations, which was greater than those reported in all the other sampled bores, indicating grout / bentonite contact with the bore water. The water quality results for MW85 should be treated with caution.

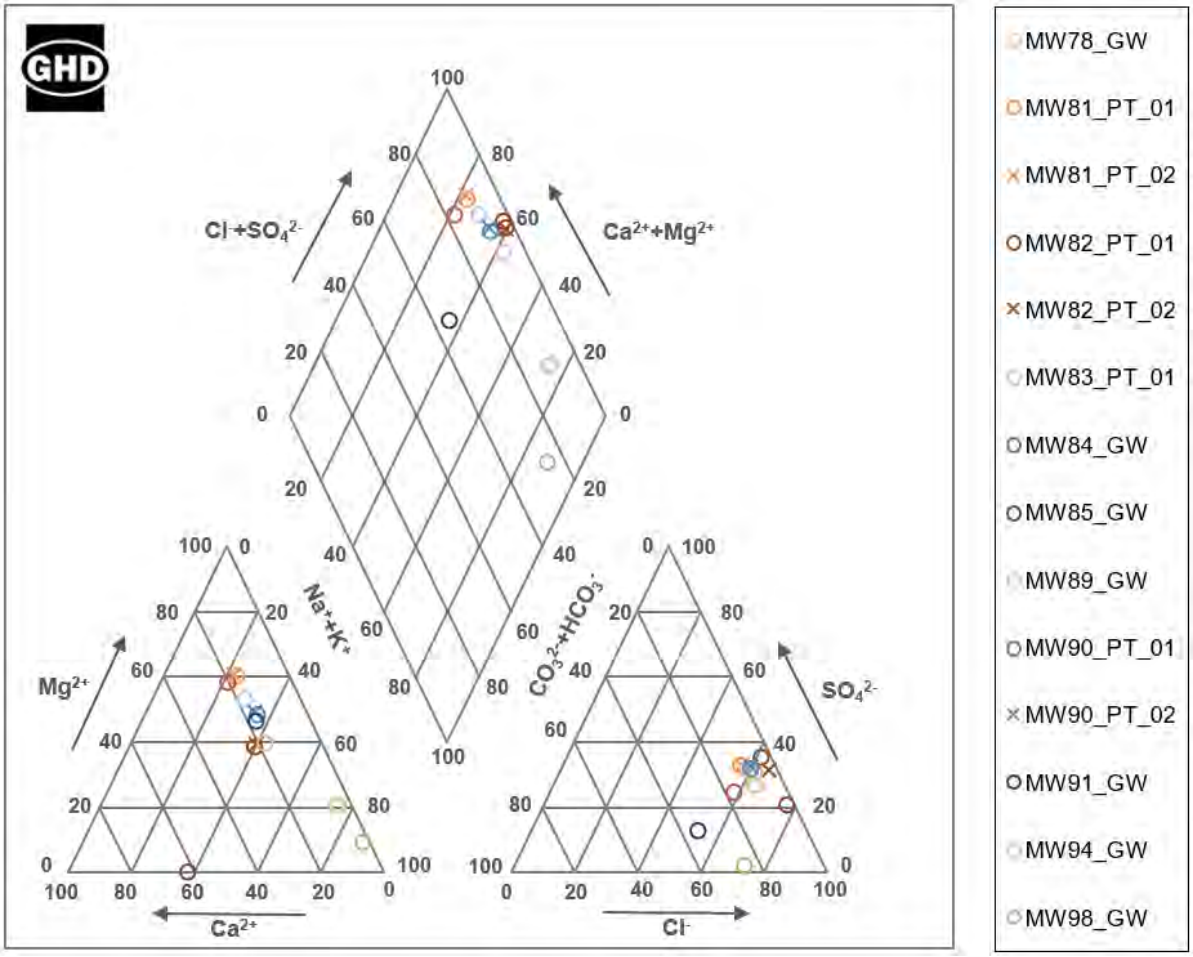

Figure 3.1 Piper tri-linear plot of major ions

Nutrient suite

Samples were analysed for nutrients and results are summarised as follows:

- Nitrate concentrations ranged from less than LOR (<0.01 mg/L) to 0.48 mg/L (MW98_GW).
- Nitrite ranged from less than LOR (<0.01 mg/L) to 0.01 mg/L (MW85_GW, MW89_GW, MW94_GW, MW98_GW).
- Ammonia concentrations ranged from 0.02 mg/L to 0.32 mg/L.
- Total nitrogen concentrations ranged from less than LOR (<0.01 mg/L) to 0.49 mg/L (MW98_GW).
- Reactive phosphorus ranged from less than LOR (0.01 mg/L) to 0.02 mg/L (MW94_GW).

One sample (MW85_GW) equalled the ANZG 2018 – FW 99% guideline value (0.32 mg/L) for ammonia as N. Laboratory analysis result interpretation from MW85_GW should be treated with caution.

Metals suite

Samples were analysed for total and dissolved iron and manganese. Results are summarised as follows and exceedances of the selected guidelines is given in Table 3.4:

- Total iron concentrations ranged from less than limit of reporting (LOR) of <0.05 mg/L to 1.39 mg/L (MW89_GW)
- All samples reported dissolved iron concentrations at less than LOR of <0.05 mg/L
- Total manganese concentrations ranged from less than LOR to 8.40 mg/L (MW82_PT_01)
- Dissolved manganese concentrations ranged from less than LOR of 0.001 mg/L to 8.05 mg/L (MW82_PT_01).

Table 3.4 Summary of samples with metals exceedances of the selected water quality guidelines

	Iron (mg/L)	Iron (filtered) (mg/L)	Manganese (mg/L)	Manganese (filtered) (mg/L)
ADWG 2011 Aesthetic (v3.7 updated 2022)	**0.3**	**0.3**	**0.1**	**0.1**

Total organic fluorine

A total of 14 groundwater samples were collected and analysed for total organic fluorine (TOF). All results were below the LOR (20 µg/L), with the exception of MW84_GW (30 µg/L).

PFAS

A total of 14 groundwater samples were collected and analysed for PFAS super ultra-trace (full suite, 28 analytes). Samples that detected at least one PFAS compounds are listed in Table 3.6, with sum of PFHxS and PFOS

concentrations ranging from 0.0577 µg/L (MW78_GW) to 26.1 µg/L (MW84_GW), and the sum of total PFAS concentrations ranging from 0.0807 µg/L (MW82_PT_01) to 39.8 µg/L (MW84_GW).

The PFAS compounds detected include:

– Perfluorobutane sulfonic acid (PFBS) detected in 13 samples
– Perfluoropentane sulfonic acid (PFPeS) detected in 14 samples
– Perfluorohexane sulfonic acid (PFHxS) detected in 14 samples
– Perfluoroheptane sulfonic acid (PFHpS) detected in 14 samples
– Perfluorooctane sulfonic acid (PFOS) detected in 14 samples
– Perfluorobutanoic acid (PFBA) detected in 4 samples
– Perfluoropentanoic acid (PFPeA) detected in 3 samples
– Perfluorohexanoic acid (PFHxA) detected in 4 samples
– Perfluoroheptanoic acid (PFHpA) detected in 3 samples
– Perfluorooctanoic acid (PFOA) detected in 5 samples

Ten samples exceeded the most conservative nominated guideline (i.e., PFAS NEMP 2.0 Health Drinking Water) value for sum of PFHxS and PFOS (0.07 µg/L) with a maximum detected concentration of 26.1 µg/L (MW84_GW).

PFAS TOPA

A total of 14 groundwater samples were collected and analysed for PFAS low level TOPA (full suite, 28 analytes). Samples that detected PFAS TOPA are listed in Table 3.7 with sum of PFHxS and PFOS (TOPA) concentrations ranging from 0.050 µg/L (MW82_PT_02) to 23.6 µg/L (MW84_GW), and the sum of total PFAS (TOPA) concentrations ranging from 0.085 µg/L (MW82_PT_02) to 40.2 µg/L (MW84_GW).

The PFAS TOPA compounds detected include:

– PFBA (TOPA) detected in 7 samples
– PFPeA (TOPA) detected in 5 samples
– PFHxA (TOPA) detected in 14 sample
– PFHpA (TOPA) detected in 3 sample
– PFOA (TOPA) detected in 6 samples
– PFBS (TOPA) detected in 14 samples
– PFPeS (TOPA) detected in 14 samples
– PFHxS (TOPA) detected in 14 samples
– PFHpS (TOPA) detected in 9 samples
– PFOS (TOPA) detected in 14 samples

Eleven samples exceeded the most conservative nominated guideline (i.e., PFAS NEMP 2.0 Health Drinking Water) value for sum of PFHxS and PFOS (TOPA) (0.07 µg/L) with a maximum detected concentration of 23.6 µg/L (MW84_GW).

The PFAS NEMP 2.0 requires quality assurance when undertaking laboratory analysis of PFAS TOPA. A summary of the compliance objectives from the PFAS NEMP 2.0 and quality assurance results is provided in Table 3.5.

Table 3.5 Summary of PFAS TOPA QA/QC compliance

Item	Objective	Summary of Results	Compliance
Total PFAS concentration post-TOPA	Total PFAS concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of total PFAS post-TOPA were equal to or greater than that of the concentration pre-TOPA, with the exception of: – MW81_PT_01 (pre-TOPA 0.166 µg/L, post-TOPA 0.161 µg/L)	Yes – while there are some post-TOPA results that are less than the Sum of PFAS pre-TOPA, all results are within the 10% decrease that is

Item	Objective	Summary of Results	Compliance
		– MW85_GW (pre-TOPA 0.623 µg/L, post-TOPA 0.618 µg/L) – MW90_PT_01 (pre-TOPA 0.224 µg/L, post-TOPA 0.221 µg/L) – MW90_PT_02 (pre-TOPA 0.228 µg/L, post-TOPA 0.216 µg/L) – MW91_PT_01 (pre-TOPA 1.48 µg/L, post-TOPA 1.42 µg/L)	expected due to analytical variability.
Sum of PFCA post-TOPA	Sum PFCA concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of the sum PFCA post-TOPA were equal to or greater than that of the concentration pre-TOPA.	Yes
Sum of PFSA post-TOPA	Sum of PFSA post-TOPA should approximate the sum of PFSA pre-TOPA	All results for the sum of PFSA post-TOPA were within the approximate sum of the Pre-TOPA results (10%), with the exception of: – MW78_GW (pre-TOPA 0.0864 µg/L, post-TOPA 0.239 µg/L)	Yes – with the exception of MW78_GW
No PFAA precursors detectable post oxidation	No PFAA precursors detectable post oxidation	No PFAA precursors were detectable in samples.	Yes

The quality assurance assessment of the PFAS TOPA analysis above shows that all samples analysed for TOPA comply with the PFAS NEMP 2.0 quality assurance measures for TOPA, with the exception of MW78_GW (sum of PFSA post-TOPA).

3.4 Quality assurance and quality control

QA/QC procedures were adopted during the fieldwork based on the minimum requirements detailed in the AS/NZS 5667.11 – 1998 (R2016), ASC NEPM and on the guidance given in the PFAS NEMP 2.0. The QA/QC system allows the collected data to be assessed and to provide evidence that the data is fit for interpretive use. QA/QC sampling was carried out by GHD field personnel during the groundwater sampling program.

3.4.1 Groundwater sampling program

3.4.1.1 Field procedures

– Field activities were compliant with GHD standard operating procedures (SOPs), which are in accordance with Australian standards, ASC NEPM and PFAS NEMP 2.0 guidance.
– Field activities were documented using standardised templates and GHD SOPs.
– Collected samples were immediately collected to laboratory-provided sample containers of appropriate type and preservation for the required laboratory analysis. All sample containers were clearly labelled with a sample number, project number, and sample date.
– A CoC form was completed and forwarded to the nominated NATA testing laboratory along with the associated samples.
– Field equipment (i.e., groundwater pump) was decontaminated according to GHD's decontamination procedure (Section 2.3)
– Duplicate samples were collected at a ratio of 1:10 samples.

3.4.1.2 Field QA/QC samples

Quality control samples (blind and split duplicate and their respective parent samples, rinsates and transport blanks) were collected during the program for the purposes of assessing the reproducibility of sample analysis results. The QA/QC samples collected during the program are as follows and details of individual samples collected are provided in Table 3.8.

– Field replicates (blind intra-laboratory and split inter-laboratory duplicates): blind and split duplicate samples were collected at a rate of 1 in 10 primary samples, with the blind sample being submitted to the primary laboratory (ALS) and the split being submitted to the secondary laboratory (Eurofins Environmental).
– Rinsate samples: Collected from sampling equipment following decontamination of the sampling pumps to check for potential cross-contamination from the sampling equipment. The rinsate samples were analysed for PFAS super ultra trace and PFAS low level TOPA. Five rinsate samples were collected.
– Field blank (PFAS): A sample of deionised water was collected in the field to demonstrate that samples were not contaminated during the sampling process. One field blank was collected during the field groundwater sampling program.
– Transport blank (PFAS): laboratory-prepared samples were provided by ALS. A transport blank was sent with batches of samples to the laboratory. Two samples were collected during the groundwater sampling program.

The blind and split duplicates and their respective parent samples, and rinsate samples are listed in Table 3.8, and the field blank and transport blank samples that were analysed are listed in Table 3.9.

Table 3.8 Summary of rinsates and field duplicate samples

Location ID	Rinsate sample (pump)	Duplicates		
		Parent sample	Blind (intra-laboratory)	Split (inter-laboratory)

3.4.1.3 Field QA/QC sample results

Sample duplicates

The data quality indicator (DQI) for acceptable blind and split duplicates relative percent difference (RPD) are as follows:

– Concentration result of <10 x LOR = no RPD limit
– Concentration result of 10-20 x LOR = acceptable RPD range 0 – 50%
– Concentration result >20 x LOR = acceptable RPD range 0 – 20%.

A quantitative measure of the accuracy of the analytical results reported is made by calculating the RPDs between the primary, blind, and split results in accordance with the procedure described in DES *Monitoring and Sampling Manual* (2018).The duplicate blind and split analytical results are compared with the parent sample in Table A2 in Appendix C.

RPD exceedances were noted for sample analytes listed in Table 3.10. When interpreting the RPD exceedances, the following should be noted:

– RPD exceedance for metals is common, especially with total iron, as particulate matter can influence iron concentrations.
– The majority of the PFAS exceedances occurred for duplicate split samples (inter-laboratory), in particular samples from MW84, which were collected from a bailer. While all efforts were made to ensure sample homogeneity, the sample transfer process from multiple bailer volumes may have introduced some sample heterogeneity.

Table 3.10 RPD exceedances

Analyte	Sample type	Primary sample	Concentration	RPD	Comment
Total iron	Primary sample	MW84_GW	0.32 mg/L	–	Both duplicates exceeded the RPD limit. High RPDs can be common, especially with total iron, as particulate matter can influence iron concentrations
	Intra-lab duplicate	FD02_GW	<0.05 mg/L	146%	
	Inter-lab duplicate	FS02_GW	0.07 mg/L	128%	
Ammonia as N	Primary sample	MW82_PT_01	0.24 mg/L	–	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Reason for RPD exceedance is unknown.
	Intra-lab duplicate	FD01_GW	0.20 mg/L	18%	
	Inter-lab duplicate	FS01_GW	0.06 mg/L	120%	
Fluoride	Primary sample	MW82_PT_01	1.6 mg/L	–	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Limit of reporting is 0.5 mg/L, and RPDs can exceed given the low values.
	Intra-lab duplicate	FD01_GW	1.6 mg/L	0%	
	Inter-lab duplicate	FS01_GW	<0.5 mg/L	105%	
PFPeS	Primary sample	MW84_GW	2.62 µg/L	–	

Analyte	Sample type	Primary sample	Concentration	RPD	Comment
	Intra-lab duplicate	FD02_GW	2.36 µg/L	10%	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Eurofins analysis notes: "*Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard*", which may account for the difference.
	Inter-lab duplicate	FS02_GW	1.4 µg/L	61%	
PFHxS	Primary sample	MW82_PT_01	0.0368 µg/L	–	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Eurofins analysis notes: "*Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard*", which may account for the difference.
	Intra-lab duplicate	FD01_GW	0.0376 µg/L	2%	
	Inter-lab duplicate	FS01_GW	0.050 µg/L	30%	
PFHpS	Primary sample	MW84_GW	0.803 µg/L	–	Both duplicates exceeded the RPD limit. Reason for RPD exceedance is unknown.
	Intra-lab duplicate	FD02_GW	1.28 µg/L	46%	
	Inter-lab duplicate	FS02_GW	1.4 µg/L	54%	
PFOS	Primary sample	MW84_GW	9.62 µg/L	–	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Eurofins analysis notes: "*Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard*", which may account for the difference.
	Intra-lab duplicate	FD02_GW	9.82 µg/L	2%	
	Inter-lab duplicate	FS02_GW	15.0 µg/L	44%	
PFPeA	Primary sample	MW84_GW	1.08 µg/L	–	Inter-laboratory sample (Eurofins) reported an exceedance of the RPD limit. Reason for RPD exceedance is unknown.
	Intra-lab duplicate	FD02_GW	1.14 µg/L	5%	
	Inter-lab duplicate	FS02_GW	0.68 µg/L	45%	
PFHpS (TOPA)	Primary sample	MW84_GW	0.800 µg/L	–	Intra-laboratory sample (ALS) reported an exceedance of the RPD limit. Reason for RPD exceedance is unknown.
	Intra-lab duplicate	FD02_GW	1.12 µg/L	33%	
	Inter-lab duplicate	FS02_GW	0.90 µg/L	12%	

Rinsate samples

All rinsate samples were taken from the decontaminated Grundfos pump during the pumping tests and the QED Sample Pro pump during low-flow sampling.

Rinsate samples were analysed for the same parameters as the parent samples (analytical schedule listed in Table 2.4). Laboratory results for the rinsate samples are tabulated in Table B2 in Appendix C. Some trace exceedances were detected for some of the analytes, outlined in Table 3.11.

Table 3.11 Detected analytes in rinsate samples

Sample ID	EC (uS/cm)	TDS (mg/L)	TSS (mg/L)	Bicarbonate as CaCO3 (mg/L)	Iron (mg/L)	Ammonia as N (mg/L)	PFOS (µg/L)
RS01_GW	ND	ND	8	2	ND	ND	ND
RS02_GW	1	ND	ND	2	ND	ND	0.0003
RS03_GW	ND	ND	ND	2	ND	ND	ND
RS04_GW	3	2	ND	3	0.06	ND	ND
RS05_GW	ND	ND	ND	3	ND	0.03	ND

Detected analytes were generally less than 2 x the LOR, indicating trace amounts. Based on the results it is considered that no cross-contamination of samples occurred during the sampling of each location. The detected PFOS concentration for rinsate sample RS02_GW a query has been lodged with the laboratory at the time of report preparation and are awaiting a response. There are cases where a false positive is detected in lab results when using super trace LOR.

Transport blank samples

All transport blank samples reported concentrations of PFAS at below the LOR (refer to Table B3 Appendix C) and as such no cross-contamination of samples was introduced during the sample preparation activities or sample transportation to the laboratory.

3.4.2 Laboratory QA/QC procedures and reporting

ALS is NATA-accredited for the analyses performed. The internal laboratory QC results are summarised in Section 3.4.2.1 and the laboratory certificates are included in Appendix D. Laboratory analysis precision and accuracy were assessed by calculating the RPD between the primary and the duplicate samples.

3.4.2.1 Laboratory QA/QC results

The laboratory QC reports (Table 3.12) for the water sample analysis reported the following:

– Analysis holding time outliers existed for some samples
– No method blank value outliers occurred
– One laboratory control outlier occurred
– No duplicate outliers occurred
– Some matrix spike outliers occurred
– For all regular sample matrices, no surrogate recovery outliers occurred
– Some raised LORs occurred

Refer to laboratory Quality Control Interpretation reports in Appendix D for the results of the outliers.

Based on the laboratory QC results, the analytical results are considered to be appropriate.

Table 3.12 Summary of laboratory quality control sample analysis outliers for water samples analysis

Work order	Analysis holding time outliers	Method blank outliers	Laboratory control outliers	Duplicate RPD outliers	Matrix spike outliers	Surrogate recovery
EB2323957	pH, nitrite, reactive P	None	None	None	None	None
EB2324241	pH, nitrite, reactive P	None	None	None	Sulfate, chloride, ammonia (1)	None

Work order	Analysis holding time outliers	Method blank outliers	Laboratory control outliers	Duplicate RPD outliers	Matrix spike outliers	Surrogate recovery
EB2324549	pH, total hardness, major cations, nitrite, reactive P	None	None	None	Total metals (Mn) (1)	None
EB2325013	pH, total hardness, major cations, nitrite, reactive P	None	10:2 FTS (2)	None	Sulfate, chloride (1) 10:2 FTS (3)	None
EB2325216	pH, total hardness, major cations, nitrite, reactive P	None	None	None	Sulfate, chloride, ammonia (1)	None

Table notes:

1. MS recovery not determined, background levels greater than or equal to 4x spike level
2. Recovery greater than upper control limit
3. Recovery greater than upper data quality objective

Table 3.13 Summary of samples with raised LORs

Analyte	Matrix interference – raised LOR	Dilution due to presence of high contaminant levels – raised LOR	Diluted due to matrix interference – raised LOR
PFAS super ultra trace	MW81_PT_01 MW81_PT_02 MW90_PT_01 MW90_PT_02 MW85_GW MW91_GW	MW84_GW FD02_GW	MW82_PT_01 MW82_PT_02 FD01_GW
PFAS low-level TOPA	–	MW84_GW FD02_GW	–
Reactive phosphorous as P	–	–	MW85_GW
Ammonia as N	–	–	RS04_GW

4. Conclusion

Groundwater sampling was completed on each of the newly installed recovery bores and groundwater monitoring bores, except for MW86 which was dry. Additionally, one existing groundwater monitoring bore (MW78) was also sampled.

Field physicochemical parameters were recorded, and samples analysed by a NATA accredited laboratory for a range of analytes including pH, EC, TDS, major ions, alkalinity, hardness, total and dissolved iron and manganese, nutrients, PFAS, PFAS TOPA, and TOF. Field and laboratory results are tabulated in summary tables included in Appendix B.

Bore MW84 reported PFAS (Sum of PFHxS & PFOS) and PFAS TOPA (Sum of PFHxS & PFOS) (TOPA) concentrations two-orders of magnitude greater than results from the other sampled bores. A blind duplicate (intra-laboratory) and split duplicate (inter-laboratory) were also collected from MW84 and both the duplicate laboratory analysis reported similar elevated PFAS concentrations. It is recommended that MW84 is sampled and analysed again to confirm the results.

The field recorded and laboratory reported pH results were elevated and inconsistent with the water quality results of the other sampled bores. Additionally, the calcium, potassium, carbonate and hydroxide alkalinity concentrations were also elevated indicating grout / bentonite contact with the bore water. MW85 would benefit from further development effort.

* A Non Detect Multiplier of 0.5 has been applied.

Comments

#1 Not specifically guideline value: >500mg/L can have purgative effects.
#2 Guideline value calculated by dividing Nitrite (as Nitrite) value (0.3 mg/L) by molecular weight (3.2967033).
#3 Indicative purposes only.
#4 Guideline value calculated by dividing Nitrite (as Nitrite) value (30 mg/L) by molecular weight (3.2967033).
#5 Measured as NH3-N at pH 8.
#6 For indicative purposes only.

Comments

#1 Not specifically guideline value: >500mg/L can have purgative effects.
#2 Guideline value calculated by dividing Nitrite (as Nitrite) value (0.3 mg/L) by molecular weight (3.2967033).
#3 Indicative purposes only.
#4 Guideline value calculated by dividing Nitrite (as Nitrite) value (30 mg/L) by molecular weight (3.2967033).
#5 Measured as NH3-N at pH 8.
#6 For indicative purposes only.

Dates

Date Samples Received	: 04-Aug-2023 09:10	Issue Date	: 07-Aug-2023
Client Requested Due Date	: 11-Aug-2023	Scheduled Reporting Date	: **11-Aug-2023**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 12.1°C - Ice Bricks present
Receipt Detail	: HARD ESKY	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please be advised that where you have requested 'Dissolved' metals, the laboratory will filter an aliquot from the non-preserved plastic (ALS Green label) container, however this is a non-compliant container/process and this should be taken into consideration when reviewing the metals data. Additional charges will be incurred for laboratory filtration.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- It is recognised that EG020T (Total Metals by ICP-MS) is less than EG020F (Dissolved Metals by ICP-MS) for 'MW83_PT_01' (EB2323957-001). However, the difference is within experimental variation of the methods.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP040: Total Organic Fluorine (TOF) in waters and leachates represents the total fluorine in the organic forms which can be extracted by the SPE method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Morgan Lennox	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Total Organic Fluorine (TOF)	0	1	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine (TOF)	EP040	WATER	In house: Fluorinated organic compounds are isolated from the sample by adsorption onto activated carbon. Hydropyrolytic combustion of the SPE extract converts organic forms of fluorine to hydrogen fluoride (HF). The HF is adsorbed in a trapping solution and the total fluoride concentration determined by Ion Chromatography (IC).
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine Preparation - Waters	EP040-PR	WATER	In house - Fluorinated organic compounds are isolated by Solid Phase Extraction (SPE). Inorganic fluorine is displaced by washing with water and organic forms eluted with Methanol.

Preparation Methods	Method	Matrix	Method Descriptions
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please be advised that where “EG005T Total Metals” analysis is requested on the Chain of Custody, “EG020T – Total Metals” analysis has been assigned as this is the standard total metals analysis assigned for samples with a water matrix. If you wish to discuss this, please contact client services at ALSEnviro.Brisbane@alsglobal.com**
- **Please note where you have asked for 'Dissolved' metals for samples "MW81_PT_01" and "MW81_PT_02", the laboratory will filter an aliquot from the non-preserved plastic (ALS Green label) container for this analysis, however this is a non-compliant container/process and should be taken into consideration when reviewing the metals data. Additional charges will be incurred for laboratory filtration.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
MW81_PT_01	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered
MW81_PT_02	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Water Container Codes: P = Unpreserved Plastic; N = Nitric Preserved Plastic; ORC = Nitric Preserved ORC; SH = Sodium Hydroxide/Cd Preserved; S = Sodium Hydroxide Preserved Plastic; AG = Amber Glass Unpreserved; AP - Airfreight Unpreserved Plastic
V = VOA Vial HCl Preserved; VB = VOA Vial Sodium Bisulphate Preserved; VS = VOA Vial Sulfuric Preserved; AV = Airfreight Unpreserved Vial SG = Sulfuric Preserved Amber Glass; H = HCl preserved Plastic; HS = HCl preserved Speciation bottle; SP = Sulfuric Preserved Plastic; F = Formaldehyde Preserved Glass;
Z = Zinc Acetate Preserved Bottle; E = EDTA Preserved Bottles; ST = Sterile Bottle; ASS = Plastic Bag for Acid Sulphate Soils; B = Unpreserved Bag.

CERTIFICATE OF ANALYSIS

Work Order	: **EB2324241**	Page	: 1 of 9
Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: MS MARIA PRSKALO	Contact	: Nathan King
Address	: GPO BOX 668 BRISBANE QLD, AUSTRALIA 4001	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: +61 07 3316 3000	Telephone	: +61-7-3243 7222
Project	: 12609270	Date Samples Received	: 08-Aug-2023 08:10
Order number	: ----	Date Analysis Commenced	: 08-Aug-2023
C-O-C number	: ----	Issue Date	: 15-Aug-2023 11:34
Sampler	: B. LLEWELLYN		
Site	:		
Quote number	: EN/005		
No. of samples received	: 5		
No. of samples analysed	: 5		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP231X-SUT PFAS Super Ultra Trace: The LOR values for particular analytes have been raised in samples ‘MW81_PT_01’ (EB2324241-001) and ‘MW81_PT_02’ (EB2324241-002) due to matrix interference.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP040: Total Organic Fluorine (TOF) in waters and leachates represents the total fluorine in the organic forms which can be extracted by the SPE method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

No. of samples received	: 5		
No. of samples analysed	: 5		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 5

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine (TOF)	EP040	WATER	In house: Fluorinated organic compounds are isolated from the sample by adsorption onto activated carbon. Hydropyrolytic combustion of the SPE extract converts organic forms of fluorine to hydrogen fluoride (HF). The HF is adsorbed in a trapping solution and the total fluoride concentration determined by Ion Chromatography (IC).
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine Preparation - Waters	EP040-PR	WATER	In house - Fluorinated organic compounds are isolated by Solid Phase Extraction (SPE). Inorganic fluorine is displaced by washing with water and organic forms eluted with Methanol.

Preparation Methods	Method	Matrix	Method Descriptions
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EB2324549**

No. of coolers/boxes	: 1	Temperature	: 3.9°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 7 / 7

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP231X-SUT PFAS Super Ultra Trace: Samples "MW82_PT_01"(EB2324549-001), "MW82_PT_02"(EB2324549-002), & "FD01_GW"(EB2324549-003) Required dilution prior to analysis due to matrix interferences. LOR values have been adjusted accordingly.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP040: Total Organic Fluorine (TOF) in waters and leachates represents the total fluorine in the organic forms which can be extracted by the SPE method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

EA005P: pH by PC Titrator									
pH Value	----	0.01	pH Unit		7.69	7.93	7.72	5.89	6.14
EA010P: Conductivity by PC Titrator									
Electrical Conductivity @ 25°C	----	1	µS/cm		10500	10200	10200	<1	<1
EA016: Calculated TDS (from Electrical Conductivity)									
Total Dissolved Solids (Calc.)	----	1	mg/L		6820	6630	6630	<1	<1
EA025: Total Suspended Solids dried at 104 ± 2°C									
Suspended Solids (SS)	----	5	mg/L		<5	<5	<5	8	<5
EA065: Total Hardness as CaCO3									
Total Hardness as CaCO3	----	1	mg/L		3530	3570	3530	<1	<1
ED037P: Alkalinity by PC Titrator									
Hydroxide Alkalinity as CaCO3	DMO-210-001	1	mg/L		<1	<1	<1	<1	<1
Carbonate Alkalinity as CaCO3	3812-32-6	1	mg/L		<1	<1	<1	<1	<1
Bicarbonate Alkalinity as CaCO3	71-52-3	1	mg/L		175	182	176	2	2
Total Alkalinity as CaCO3	----	1	mg/L		175	182	176	2	2
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA									
Sulfate as SO4 - Turbidimetric	14808-79-8	1	mg/L		2030	1980	2030	<1	<1
ED045G: Chloride by Discrete Analyser									
Chloride	16887-00-6	1	mg/L		2640	3050	2730	<1	<1
ED093F: Dissolved Major Cations									
Calcium	7440-70-2	1	mg/L		513	503	519	<1	<1
Magnesium	7439-95-4	1	mg/L		547	563	542	<1	<1
Sodium	7440-23-5	1	mg/L		1060	1080	1080	<1	<1
Potassium	7440-09-7	1	mg/L		3	2	3	<1	<1
EG005(ED093)T: Total Metals by ICP-AES									
Iron	7439-89-6	0.05	mg/L		<0.05	<0.05	<0.05	<0.05	<0.05
Manganese	7439-96-5	0.01	mg/L		8.40	6.85	8.12	<0.01	<0.01
EG020F: Dissolved Metals by ICP-MS									
Manganese	7439-96-5	0.001	mg/L		8.05	7.50	8.40	----	----
Iron	7439-89-6	0.05	mg/L		<0.05	<0.05	<0.05	----	----
EK040P: Fluoride by PC Titrator									
Fluoride	16984-48-8	0.1	mg/L		1.6	1.4	1.6	<0.1	<0.1
EK055G: Ammonia as N by Discrete Analyser									
Ammonia as N	7664-41-7	0.01	mg/L		0.24	0.18	0.20	<0.01	<0.01

No. of samples received	: 7		
No. of samples analysed	: 7		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 7

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Total Recoverable Metals by ICP-AES	EG005T	WATER	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Samples are digested by USEPA 3005 prior to analysis. The ICPAES technique ionises the sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine (TOF)	EP040	WATER	In house: Fluorinated organic compounds are isolated from the sample by adsorption onto activated carbon. Hydropyrolytic combustion of the SPE extract converts organic forms of fluorine to hydrogen fluoride (HF). The HF is adsorbed in a trapping solution and the total fluoride concentration determined by Ion Chromatography (IC).
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine Preparation - Waters	EP040-PR	WATER	In house - Fluorinated organic compounds are isolated by Solid Phase Extraction (SPE). Inorganic fluorine is displaced by washing with water and organic forms eluted with Methanol.

Preparation Methods	Method	Matrix	Method Descriptions
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of coolers/boxes	: 1	Temperature	: -0.1°C - Ice present
Receipt Detail	: MEDIUM HARD ESKY	No. of samples received / analysed	: 6 / 6

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EK055G (Ammonia as N): Sample EB2325013-003 (RS04_GW) was diluted due to matrix interference. LOR adjusted accordingly.
- EP231X-SUT PFAS Super Ultra Trace: The high recovery laboratory control standard for 10:2 FTS is deemed acceptable as associated results are less than the limit of reporting.
- EP231X-SUT PFAS Super Ultra Trace: The high recovery matrix spike for 10:2 FTS is deemed acceptable as associated results are less than the limit of reporting.
- EP231X-SUT PFAS Super Ultra Trace: The LORs of particular analytes for particular samples have been raised due to sample matrix interferences (Internal Standard Suppression). The LORs of particular analytes have been raised further due to additional matrix interferences.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP040: Total Organic Fluorine (TOF) in waters and leachates represents the total fluorine in the organic forms which can be extracted by the SPE method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

No. of samples received	: 6		
No. of samples analysed	: 6		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Total Recoverable Metals by ICP-AES	EG005T	WATER	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Samples are digested by USEPA 3005 prior to analysis. The ICPAES technique ionises the sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine (TOF)	EP040	WATER	In house: Fluorinated organic compounds are isolated from the sample by adsorption onto activated carbon. Hydropyrolytic combustion of the SPE extract converts organic forms of fluorine to hydrogen fluoride (HF). The HF is adsorbed in a trapping solution and the total fluoride concentration determined by Ion Chromatography (IC).
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine Preparation - Waters	EP040-PR	WATER	In house - Fluorinated organic compounds are isolated by Solid Phase Extraction (SPE). Inorganic fluorine is displaced by washing with water and organic forms eluted with Methanol.

Preparation Methods	Method	Matrix	Method Descriptions
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EB2325216**

Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Brisbane

Dates

Date Samples Received	: 17-Aug-2023 12:30	Issue Date	: 17-Aug-2023
Client Requested Due Date	: 24-Aug-2023	Scheduled Reporting Date	: **24-Aug-2023**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 2	Temperature	: 1.7°C, 2.4°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 11 / 10

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **An extra sample was received labelled as "Trip Blank 210701" (ALS #11) and has been placed on hold. If testing is required on this sample, please contact ALS Client Services at ALSEnviro.Brisbane@alsglobal.com**
- **Sample "FS02_GW" has been forwarded to EUROFINS, as requested. Please note that this will incur a freight forwarding fee.**
- ***Samples were originally received by ALS GLADSTONE on 15/08/23 and have been forwarded to ALS Brisbane for analysis. Temperature on arrival in ALS Brisbane has been noted above.**
- **PLEASE NOTE: As a DATE was not given on the Chain of Custody or the sample container for sample #11 'Trip Blank 210701, the RELINQUISHED BY Date has been used in its place. If you wish to discuss this further please contact ALS Brisbane Client Services Department at ALSEnviro.Brisbane@alsglobal.com.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **EB2325216**	Page	: 1 of 15
Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: MS MARIA PRSKALO	Contact	: Nathan King
Address	: GPO BOX 668 BRISBANE QLD, AUSTRALIA 4001	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: +61 07 3316 3000	Telephone	: +61-7-3243 7222
Project	: 12609270	Date Samples Received	: 17-Aug-2023 12:30
Order number	: ----	Date Analysis Commenced	: 17-Aug-2023
C-O-C number	: ----	Issue Date	: 24-Aug-2023 15:03
Sampler	: FABIO MANCA		
Site	:		
Quote number	: EN/005		
No. of samples received	: 11		
No. of samples analysed	: 10		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- E231X-SUT PFA Super Ultra Trace: The LOR for particular analytes has been raised for particular samples due to matrix interference.
- It is recognised that EK059G (Nitrite + Nitrate) is less than EK057G (Nitrite) for sample MW94_GW (EB2325216-005). However, the difference is within experimental variation of the methods.
- EK071G (Reactive Phosphorous as P): Sample MW85_GW (EB2325216-002) was diluted due to matrix interference. LOR adjusted accordingly.
- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- EP231X-SUT PFAS Super Ultra Trace: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X-LL(TOP) PFAS TOPA: Samples 'MW84_GW' (EB2325216-001) and 'FD02_GW' (EB2325216-008) required dilution prior to extraction due to high-level contaminants. LOR values have been adjusted accordingly.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP040: Total Organic Fluorine (TOF) in waters and leachates represents the total fluorine in the organic forms which can be extracted by the SPE method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.

Analytical Results

Quote number	: EN/005		
No. of samples received	: 11		
No. of samples analysed	: 10		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Beatriz Llarinas	Senior Chemist - Inorganics	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Total Recoverable Metals by ICP-AES	EG005T	WATER	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Samples are digested by USEPA 3005 prior to analysis. The ICPAES technique ionises the sample atoms emitting a characteristic spectrum. This spectrum is then compared against matrix matched standards for quantification. This method is compliant with NEPM Schedule B(3).
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine (TOF)	EP040	WATER	In house: Fluorinated organic compounds are isolated from the sample by adsorption onto activated carbon. Hydropyrolytic combustion of the SPE extract converts organic forms of fluorine to hydrogen fluoride (HF). The HF is adsorbed in a trapping solution and the total fluoride concentration determined by Ion Chromatography (IC).
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Total Organic Fluorine Preparation - Waters	EP040-PR	WATER	In house - Fluorinated organic compounds are isolated by Solid Phase Extraction (SPE). Inorganic fluorine is displaced by washing with water and organic forms eluted with Methanol.

Preparation Methods	Method	Matrix	Method Descriptions
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

1. Introduction

GHD Pty Ltd completed a drilling and bore installation program as part of the *Callide Groundwater Bore Drilling Project* at CS Energy Limited (CSE) Callide Power Station located near Biloela, in Central Queensland.

CSE has undertaken a series of investigative works at Callide Power Station (the 'Project site') to investigate potential impacts and risks associated with the historical use of Aqueous Film Forming Foam (AFFF) at the site. The preliminary investigations were triggered by the Queensland Government's implementation of the *Environmental Management of Firefighting Foam Operational Policy* issued in July 2016. The policy provided information on the requirements for a three-year transition period to fluorine-free foams, or alternative foams containing at least 99.5% shorter-chain per- and poly-fluoroalkyl substances (PFAS).

Subsequent investigations were commissioned by CSE in response to the Department of Environment and Science (DES) notice to conduct an Environmental Evaluation (EE) (Reference: EPPR00536313 | CCPLRC-100046232, most currently dated 21 August 2023) requiring CSE to investigate and assess the source, cause, and extent of any actual or potential environmental harm resulting from the historical use of AFFF on site.

CSE prepared a scope of work to undertake a targeted drilling and monitoring bore installation program to fulfill the requirements of the EE and to further characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises.

GHD were engaged to undertake the drilling, bore installation, and testing program. The *Callide Groundwater Bore Drilling Project* included the following tasks:

– Drilling and installation of five recovery bores and six monitoring bores
– Soil and drill cuttings sampling and analysis
– Pumping tests on the five recovery bores
– Groundwater sampling of newly installed bores plus one existing bore
– Survey of newly installed bores
– Reporting

The details of the field program are outlined in GHD report *Factual Bore Completion Report*.

1.1 Purpose of this report

The purpose of this report is to document the soils and solids (drill cuttings) sampling methodology and summarise the results of the soil and solid samples analysis.

This report presents factual data collected and observations made during the soil sampling field program. This report should be read in conjunction with the *Factual Bore Completion Report* (GHD 2023a) and the *Groundwater Sampling Report* (GHD 2023c).

1.2 Scope and limitations

This report is subject to the limitations set out below and must be read in conjunction with each of the supporting technical reports summarised in Section 1.1, as well as the assumptions, exclusions, and qualifications within the supporting technical reports.

This report has been prepared by GHD Pty Ltd (GHD) for CS Energy Limited (CSE) for the purpose of responding to a notice to conduct an environmental evaluation issued by the administering authority pursuant to section 326B of the *Environmental Protection Act 1994* (Qld) (EP Act) (the Purpose), and not for any other purpose. The report may be used by Queensland Department of Environment and Science (DES), acting in its capacity as the administering authority (as defined in the EP Act)), and the appointed contaminated land auditor, and Luke Amies (Suitably Qualified Person) for the Purpose. GHD disclaims responsibility and liability to any person other than CSE arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally possible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

While every effort has been made by GHD to assess contamination as required by the scope of services, GHD cannot, guarantee that other issues outside of the scope of services do not remain.

GHD has prepared this report on the basis of information provided by CSE and others who provided information to GHD (including Government authorities and analytical laboratories), which GHD has not independently verified or checked beyond the agreed scope of work. Where drill hole logs, laboratory tests and similar work have been performed and recorded by others the data is included and used in the form provided by others. The responsibility for the accuracy of such data remains with the issuing authority, not with GHD. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described throughout this report. GHD disclaims liability arising from any of the assumptions being incorrect. The opinions, conclusions and any recommendations in this report are based on information obtained from site inspections and sample collection at discrete locations across the site and may not fully represent the conditions that may be encountered across the site at other than these locations. It is emphasised that the actual characteristics of the sub-surface and surface materials may vary significantly between adjacent test points and sample intervals and at locations other than where observations, explorations and investigations have been made. Sub-surface conditions, including groundwater levels and contaminant concentrations can change in a limited time. This should be borne in mind when assessing the data. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

It should be noted that because of the inherent uncertainties in the sub-surface evaluations, changed or unanticipated sub-surface conditions may occur that could affect the opinions GHD has expressed, which may need to be re-examined and changed. GHD does not accept responsibility for the consequences of significant variations in the conditions.

An understanding of the site conditions depends on the integration of many pieces of information, some regional, some site specific, some structure-specific and some experienced based. Hence, this report must be read in full and should not be altered, amended, or abbreviated, issued in part, or issued incomplete in any way without prior checking and approval by GHD.

GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date the report was prepared.

1.3 Assumptions

The following assumptions and qualifications are made in relation to the content of this report:

– Sampling locations were determined by CSE

2. Methodology

2.1 Sampling locations

At each of the drilling locations soil and drill cutting samples were collected. For the purposes of this report drill cuttings are defined as comprising of the upper residual soils / fill (soil) and rock chips (solids), produced during the drilling process.

Each sampling point is shown on Figure 2.1 and the location summarised in Table 2.1.

Table 2.1 Soil/solid sampling locations summary

Location ID	Easting	Northing	Ground elevation (m AHD)	Location
MW81	258295.466	7304124.687	210.192	On site, Lower Ring Road

MW91	258097.269	7303613.698	193.772	Off site, Cocups Road
MW94	257792.558	7303623.283	194.311	On site, fire track
MW98	256822.495	7303493.653	190.004	On site, fire track

The soil/solid sampling scope of work included taking samples as follows:

– Shallow sub-surface natural soil samples
– Composite sample of all drill cuttings (soils and solids) for the purposes of characterising the PFAS concentrations in the drill cuttings.
– After the drilling program had commenced CSE requested additional sampling of:
  - Deeper sub-surface soils at approximately 0.5 m depth
  - Composite sample of drill cuttings (solids) along the water-bearing zone identified during drilling (typically where the bore screen was installed, however could span greater than the 6 m screen interval).

A summary of samples collected of the soils/solids is provided in Table 2.2.

Table 2.2 Summary of soil/solid samples collected

Data source: Basemaps_LatestStateProgram_AllUsers: . DoR: roads (2021), watercourse (2022), cadastre (2023); GHD: sample locations (2023). Created by: thunt2

2.2 Sampling methodology

2.2.1 Shallow and deeper sub-surface soil sampling

Each drilling location was hand augered up to 1 m depth or to natural ground to ensure no underground services were present. At each location, one shallow sub-surface soil sample and one deeper sub-surface soil sample was collected per drilling location.

Prior to hand augering, stones, vegetation, debris, etc. were removed from the ground surface in the sampling location area. The sample location was cleared using a decontaminated hand auger to expose a fresh sampling surface.

Soil sampling was conducted in accordance with the PFAS sampling guideline (PFAS NEMP version 2.0). The soil samples were collected directly from the stainless-steel hand auger, and placed into laboratory supplied containers, which comprised of a plastic container for PFAS, and where required a glass jar.

2.2.1.1 Decontamination procedure

The hand auger was decontaminated between sampling locations using the following procedure:

– Removal of excess soil particles with a brush
– Scrub hand auger with a brush within a solution of potable water and low phosphate detergent (Liquinox®), which is confirmed as PFAS-free
– Rinse hand auger with deionised water three-times
– Final rinse with deionised water

One rinsate sample per day was collected from the hand auger following decontamination.

2.2.2 Solid drill cuttings sampling

Throughout the drilling program, samples were collected from excess drill cuttings returning to surface generated during drilling. A composite sample was collected by taking a small sub-sample from each 1 m of drill cuttings. The composite sample was mixed in a stainless-steel bowl and placed into a laboratory-provided PFAS HDPE jar.

The samples of drill cuttings were analysed to characterise the drilling waste. One sample per location was analysed for PFAS (28 analytes) and PFAS Total Oxidisable Precursor Assay (TOPA) (28 analytes).

2.2.3 Water-bearing unit sampling

A composite sample of the drill cuttings from the water-bearing zone, identified during drilling, was collected by taking a small sub-sample from each 1 m of drill cuttings. The composite sample was mixed and placed into a laboratory-provided PFAS HDPE jar and glass jar. The sample generally corresponded with the installed screened section of the bore, however the sampling interval may be greater than the 6 m screen length.

2.3 Sample handling

The soil/solid samples were logged, collected, and reported by GHD's appointed supervising hydrogeologist. Descriptions of the samples are shown on the borehole logs, provided in the *Factual Bore Completion Report* (GHD, 2023a) and are summarised in the results tables included in Appendix A.

Once collected, the soil samples were placed into ice-chilled insulated containers while in the field and then stored in a fridge. Samples were batched into ice-chilled insulated containers for transport under chain of custody (COC) documentation to laboratories certified by National Association of Testing Authorities (NATA) for analysis. ALS have confirmed that their standard method of sample analysis preparation involved homogenising the sample provided to the laboratory prior to obtaining the analytical sub-sample (GHD, pers. comms, 2023e).

Collection of quality assurance and quality control samples (QA/QC) included duplicates (field blank and field split), rinsate samples from the hand auger, rinsate blanks for PFAS, and transport blanks for PFAS.

2.4 Analytical schedule

The analytical schedule and the number of collected soil samples is summarised in Table 2.3. Results of the soil/solid samples analysis are summarised in Section 3.

Table 2.3 Analytical schedule and number of collected soil samples

Sample type	Parameter	Primary samples	Duplicate samples(1)	Rinsate samples(2)
Shallow sub-surface soils	– PFAS – Full Suite (28 analytes) – PFAS – Total Oxidisable Precursor Assay (TOPA) (28 analytes)	11	2	10
Deeper sub-surface soils	– PFAS – Full Suite (28 analytes)	8	1	
Drill cutting composite samples	– PFAS – Full Suite (28 analytes) – PFAS – TOPA (28 analytes)	11	3	NA
Water-bearing units composite samples	– PFAS – Full Suite (28 analytes) – pH, electrical conductivity (EC), total organic carbon (TOC) – iron (Fe) and manganese (Mn) – PFAS – TOPA (28 analytes)(3)	8	1	NA

Notes:

1. Duplicates (blind and split): 1 duplicate sample in 10 primary samples for soil.
2. Rinsates: rinsate samples from hand auger
3. Analysis of TOPA completed only where PFAS was detected above LOR.

3. Results

The laboratory results are tabulated in Appendix A and the laboratory certificates are included in Appendix B.

3.1 Relevant Guidelines

The guideline values selected to compare the analytical results are:

– PFAS NEMP 2.0 – Human health investigation levels for soils – Industrial / Commercial (HIL D)
– PFAS NEMP 2.0 – Ecological guideline values for soil – Ecological direct exposure
– PFAS NEMP 2.0 – Ecological guideline values for soil – Ecological indirect exposure

The HIL D values have been selected to assess the potential exposure of impacted soils to CSE workers (noting that the likelihood of exposure of workers to soils at depth is low). The ecological direct exposure soil guidelines apply specifically to protection of organisms that live within, or in close contact with soil, such as earthworms and plants. The ecological indirect exposure soil guidelines are to assess the potential risks from dietary exposure of a secondary consumer. The likelihood of direct exposure to soils encountered during drilling (particularly at depth) are low, hence more focus on PFAS concentrations encountered at shallow depths are of greater importance.

3.2 Soil samples

The analytical results for shallow sub-surface and deeper sub-surface soil samples are presented in Table A1, Appendix A. The samples were analysed for PFAS (full suite, 28 analytes) and/or PFAS TOPA (full suite, 28 analytes).

A total of 19 soil samples were collected and analysed for PFAS and 13 soil samples were collected and analysed for PFAS TOPA. Samples that reported a detection of PFAS and PFAS TOPA are listed in Table 3.2 and Table 3.3, respectively. Detected PFAS and PFAS TOPA concentrations are shown on Figure 3.1.

PFAS

PFAS compounds were detected in four out of 19 samples analysed, with concentrations ranging from 0.0002 mg/kg to 0.0051 mg/kg and sum of total PFAS concentrations ranging from 0.0006 mg/kg to 0.0071 mg/kg.

The PFAS compounds detected includes:

– Perfluorobutane sulfonic acid (PFBS) detected in one sample
– Perfluorohexane sulfonic acid (PFHxS) detected in three samples
– Perfluorooctane sulfonic acid (PFOS) detected in three samples
– Perfluoropentanoic acid (PFPeA) detected in one sample
– Perfluorohexanoic acid (PFHxA) detected in two samples

None of the analysed samples exceeded the nominated guidelines.

PFAS TOPA

PFAS TOPA compounds were detected in four out of 13 samples analysed with concentrations ranging from 0.0003 mg/kg to 0.0069 mg/kg and sum of PFAS concentrations ranging from 0.0003 mg/kg to 0.0095 mg/kg.

The PFAS TOPA compounds detected includes:

– PFPeA (TOPA) detected in one sample
– PFHxA (TOPA) detected in two samples
– PFBS (TOPA) detected in two samples
– PFHxS (TOPA) detected in two samples
– PFOS (TOPA) detected in one sample

None of the analysed samples exceeded the nominated guidelines.

The PFAS NEMP 2.0 requires quality assurance when undertaking laboratory analysis of PFAS TOPA. A summary of the compliance objectives from the PFAS NEMP 2.0 and quality assurance results is provided in Table 3.1.

Table 3.1 Summary of PFAS TOPA QA/QC compliance

Item	Objective	Summary of Results	Compliance
Total PFAS concentration post-TOPA	Total PFAS concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of total PFAS post-TOPA were equal to or greater than that of the concentration pre-TOPA, with the exception of: – MW82_SS_0.35-0.45 (pre-TOPA 0.0006 µg/L, post-TOPA 0.0003 µg/L) – MW83_SS_0.20-0.25 (pre-TOPA 0.0015 µg/L, post-TOPA 0.0007 µg/L)	Yes – with the exception of MW82_SS_0.35-0.45 and MW83_SS_0.20-0.25, both returning Post-TOPA results with a greater than 10% difference that the pre-TOPA analysis
Sum of PFCA post-TOPA	Sum PFCA concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of the sum PFCA post-TOPA were equal to or greater than that of the concentration pre-TOPA.	Yes
Sum of PFSA post-TOPA	Sum of PFSA post-TOPA should approximate the sum of PFSA pre-TOPA	All results for the sum of PFSA post-TOPA were within the approximate sum of the Pre-TOPA results (10%).	Yes
No PFAA precursors detectable post oxidation	No PFAA precursors detectable post oxidation	No PFAA precursors were detectable in samples.	Yes

The quality assurance assessment of the TOPA analysis above shows that all samples analysed for TOPA comply with the PFAS NEMP 2.0 quality assurance measures for TOPA, with the exception of MW82_SS_0.35-0.45 and MW83_SS_0.20-0.25 (sum of PFAS post-TOPA).

Data source: Basemaps_LatestStateProgram_AllUsers: . DoR: roads (2021), watercourse (2022), cadastre (2023); GHD: sample locations (2023). Created by: thunt2

3.3 Drill cutting composite samples

The results for the drill cutting composite samples are tabulated in Table A2, included in Appendix A.

Eleven samples of drill cuttings were submitted to the laboratory for analysis of PFAS and TOPA. Only one sample reported detected PFAS compounds and PFAS TOPA. The purpose of the drill cuttings analysis was for drilling cutting waste characterisation. The drill cutting were disposed into the base of the decommissioned drilling pits. Further details on the waste management are provided in the *Factual Bore Completion Report* (GHD, 2023a).

PFAS

PFAS compounds were detected in one out of 11 samples analysed, with a sum of PFHxS and PFOS concentration of 0.0084 mg/kg and a sum of total PFAS concentration of 0.011 mg/kg.

The PFAS compounds detected in sample MW84_DC_0.0-39.0 includes:

– Perfluorobutane sulfonic acid (PFBS)
– Perfluoropentane sulfonic acid (PFPeS)
– Perfluorohexane sulfonic acid (PFHxS)
– Perfluorohepane sulfonic acid (PFHpS)
– Perfluorooctane sulfonic acid (PFOS)
– Perfluorohexanoic acid (PFHxA)
– Perfluorooctanoic acid (PFOA)

None of the analysed samples exceeded the nominated guidelines.

PFAS TOPA

PFAS TOPA was detected in one out of 11 samples analysed, with a sum of PFHxS and PFOS (TOPA) concentration of 0.0068 mg/kg and a sum of Total PFAS (TOPA) concentration of 0.0096 mg/kg.

The PFAS TOPA detected in sample MW84_DC_0.0-39.0 includes:

– Perfluoropentanoic acid (PFPeA) (TOPA)
– Perfluorohexanoic acid (PFHxA) (TOPA)
– Perfluorooctanoic acid (PFOA) (TOPA)
– Perfluorobutane sulfonic acid (PFBS (TOPA)
– Perfluoropentane sulfonic acid (PFPeS) (TOPA)
– Perfluorohexane sulfonic acid (PFHxS) (TOPA)
– Perfluorooctane sulfonic acid (PFOS) (TOPA)

None of the analysed samples exceeded the nominated guidelines.

A summary of the compliance objectives from the PFAS NEMP 2.0 and quality assurance results is provided in Table 3.4.

Table 3.4 Summary of TOPA QAQC compliance

Item	Objective	Summary of Results	Compliance
Total PFAS concentration post-TOPA	Total PFAS concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of total PFAS post-TOPA were equal to or greater than that of the concentration pre-TOPA, with the exception of: – MW84_DC_0.0-0.39 (pre-TOPA 0.0110 µg/L, post-TOPA 0.0096 µg/L)	Yes – while MW84_0.0-0.39 post-TOPA results that are less than the Sum of PFAS pre-TOPA, all results are within the 10% decrease that is expected due to analytical variability.

Item	Objective	Summary of Results	Compliance
Sum of PFCA post-TOPA	Sum PFCA concentration post-TOPA should be equal or greater than the total PFAS concentration pre-TOPA	All results of the sum PFCA post-TOPA were equal to or greater than that of the concentration pre-TOPA.	Yes
Sum of PFSA post-TOPA	Sum of PFSA post-TOPA should approximate the sum of PFSA pre-TOPA	All results for the sum of PFSA post-TOPA were within the approximate sum of the Pre-TOPA results (10%)	Yes
No PFAA precursors detectable post oxidation	No PFAA precursors detectable post oxidation	No PFAA precursors were detectable in samples.	Yes

The quality assurance assessment of the TOPA analysis above shows that all samples analysed for TOPA comply with the PFAS NEMP 2.0 quality assurance measures for TOPA.

3.4 Water-bearing unit composite samples

The results for the water-bearing unit composite samples are tabulated in Table A3, included in Appendix A.

Eight water-bearing unit composite samples were collected and submitted for PFAS analysis. None of the samples detected PFAS. All samples were also scheduled for analysis of pH, EC, TOC, iron, and manganese.

3.5 Quality assurance and quality control

QA/QC procedures were adopted during the fieldwork based on the minimum requirements detailed in the New South Wales Environmental Protection Agency (2022) *Contaminated Land Guidelines: Sampling design part 1 – application*, and on the guidance given in the PFAS NEMP 2.0. The QA/QC system allows the collected data to be assessed and to provide evidence that the data is fit for interpretive use. QA/QC sampling was carried out by GHD field personnel during soil sampling program.

3.5.1 Field soil sampling program

The results of the QA/QC samples are tabulated in Appendix A.

3.5.1.1 Field procedures

- Field activities were compliant with GHD standard operating procedures (SOPs) which are in accordance with industry standards and PFAS NEMP 2.0 guidance.
- Field activities were documented using standardised templates and GHD SOPs.
- Samples collected from the hand auger were immediately transferred to laboratory-provided sample containers of appropriate type for the required laboratory analysis. All sample containers were clearly labelled with a sample number, project number, and sample date.
- Composite samples were sub-sampled and mixed in a stainless-steel bowl before being transferred to laboratory-provided sample containers of appropriate type for the required laboratory analysis.
- A chain of custody (CoC) form was completed and forwarded to the nominated National Association of Testing Authorities (NATA) testing laboratory along with the associated samples.
- Field equipment (i.e., hand auger) was decontaminated according to GHD's SOPs.
- Duplicate samples were collected at ratio of 1:10 samples.

3.5.1.2 Field QA/QC samples

Quality control samples (blind and split duplicate and their respective parent samples, rinsates and transport blanks) were collected during the program for the purposes of assessing the reproducibility of sample analysis results. The QA/QC samples collected during the program are as follows and details of individual samples collected are provided in Table 3.5 and Table 3.4.

– Field replicates (blind intra-laboratory and split inter-laboratory duplicates): Blind and split duplicate samples were collected at a rate of 1 in 10 primary samples, with the blind sample being submitted to the primary laboratory (ALS) and the split being submitted to the secondary laboratory (Eurofins Environmental).
– Rinsate samples: Collected from the hand auger following decontamination to check for potential cross-contamination from the sampling equipment. The rinsate samples were analysed for PFAS Super Ultra Trace and PFAS TOPA Low Level. One rinsate sample was collected after sampling each location. Composite samples were mixed in a stainless-steel bowl. A rinsate sample was not collected from the bowl.
– Field blank (PFAS): A sample of deionised water was collected in the field to ensure that samples are not contaminated during the sampling process. One field blank was collected during the field soil/solid sampling program.
– Transport blank (PFAS): laboratory-prepared samples were provided by ALS. A transport blank was sent with batches of samples to the laboratory. Two samples were collected during the soil/solid sampling program.

The blind and split duplicates and their respective parent samples, and rinsate samples are listed in Table 3.5, and the field blank and transport blank samples that were analysed are listed in Table 3.6.

Table 3.5 Summary of rinsates and field duplicate samples

PFAS TOPA Low Level		

3.5.1.3 Field QA/QC sample results

Sample duplicates

The data quality objectives (DQO) for acceptable blind and split duplicates RPD are as follows:

– Concentration result of <10 x LOR = no RPD limit.
– Concentration result of 10-20 x LOR = acceptable RPD range 0 – 50%.
– Concentration result >20 x LOR = acceptable RPD range 0 – 20%.

A quantitative measure of the accuracy of the analytical results reported is made by calculating the RPDs between the primary, blind, and split results in accordance with the procedure described in AS 4482.1-2005.The duplicate blind and split analytical results are compared with the parent sample in Table A4 in Appendix A.

There were no RPD exceedances, except for:

– PFBS (TOPA) reporting at 0.0003 mg/kg in the parent sample (MW82_SS_0.35-0.45) and less than the LOR (<0.0002 mg/kg) in the blind intra-laboratory sample (FD01_SS). Given the values are trace amount and close to the LOR, this RPD exceedance is not of concern.
– Iron and manganese concentrations in sample MW89_WB_5.0-11.0 reported RPDs of 175% and 107%, respectively, compared with the split inter-laboratory duplicate (FS05_WB). Given the samples were drill chips, obtaining a representative sample selection by the laboratory would be difficult given the heterogeneity of the rock material and size of the chips.

Rinsate samples

All rinsate samples were taken from the decontaminated hand auger.

All analyte concentrations for rinsate samples reported at below the LOR (refer to Table A5 Appendix A). Based on the results it is considered that no cross-contamination of samples occurred during the sampling of each location.

Transport blank samples

All transport blank samples reported concentrations of PFAS at below the LOR (refer to Table A6 Appendix A) and as such no cross-contamination of samples was introduced during the sample preparation activities or sample transportation to the laboratory.

3.5.2 Laboratory QA/QC procedures and reporting

ALS is NATA-accredited for the analyses performed. The internal laboratory QC results are summarised in Section 3.5.2.1 and the laboratory certificates are included in Appendix B. Laboratory analysis precision and accuracy were assessed by calculating the RPD between the primary and the duplicate samples.

3.5.2.1 Laboratory QA/QC results

The laboratory QC reports for the soil/solids sample analysis reported the following:

– Analysis holding time outliers existed for some samples for pH (1:5) and EC (1:5) in soils, as well as for moisture content.
– No method blank value outliers occurred
– No laboratory control outliers occurred
– Some duplicate outliers occurred
– Some matrix spike outliers occurred
– For all regular sample matrices, no surrogate recovery outliers occurred
– No raised LORs occurred

Table 3.7 Summary of laboratory quality control sample analysis outliers for soil/solid samples analysis

Work order	Analysis holding time outliers	Method blank outliers	Laboratory control outliers	Duplicate RPD outliers	Matrix spike outliers	Surrogate recovery
EB2323019	Yes (pH, EC, moisture content)	No	No	Yes Total metals (Mn) PFOS	Yes PFHxS	No
EB2323963	No	No	No	No	No	No
EB2324147	No	No	No	No	No	No
EB2324149	Yes (pH, EC)	No	No	Yes Total metals (Fe, Mn)	No	No

Table 3.8 Summary of laboratory quality control sample analysis outliers for water samples analysis

Work order	Analysis holding time outliers	Method blank outliers	Laboratory control outliers	Duplicate RPD outliers	Matrix spike outliers	Surrogate recovery
EB2323019	No	No	No	No	No	No
EB2323207	No	No	Yes (10:2 FTS)	No	No	No
EB2324155	No	No	No	No	No	No

Refer to laboratory Quality Control Interpretation reports in Appendix B for the results of the outliers.

Laboratory duplicate outliers for soil samples when analysing for metals (particularly iron and manganese) is common, as soils typically have various metals-based compounds that occur naturally in the soils. Sample heterogeneity can result in RPD exceedances.

Based on the laboratory QC results, the analytical results are considered to be appropriate.

***RPDs have only been considered where a concentration is greater than 1 times the EQL.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 999 (1 - 10 x EQL); 50 (10 - 20 x EQL); 20 (> 20 x EQL))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary lab**

***RPDs have only been considered where a concentration is greater than 1 times the EQL.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 999 (1 - 10 x EQL); 50 (10 - 20 x EQL); 20 (> 20 x EQL))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary lab**

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please be advised that a number of sample ID discrepancies exist as noted in the Additional Information section of the received Chain of Custody. All sample IDs have been assigned per the Sample ID column. If you would like to discuss this further, please contact Client Services at ALSEnviro.Brisbane@alsglobal.com.**
- **Please be advised that for samples #30 - 36, PFAS analysis has not been assigned per the additional information section of the received Chain of Custody. If you would like to discuss this further, please contact Client Services at ALSEnviro.Brisbane@alsglobal.com.**
- **3/8/23: SRN has been resent to acknowledge additional analysis per Maria Prskalo. Please note that the reporting date has been updated to allow for this change. For any further information regarding these adjustments please contact client services at ALSEnviro.Brisbane@alsglobal.com.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **An extra sample was received labelled as "MW85_DC_25-34m" (ALS # 46) and has been placed on hold. If testing is required on this sample, please contact ALS Client Services at ALSEnviro.Brisbane@alsglobal.com**
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X PFAS: Sample 'MW81_SS_0.45-0.50' (EB2323019_001) shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- EG005T (Total Metals by ICP-AES): MW83_WB_14.9-19.0 (EB2323019-030) shows poor duplicate results due to sample heterogeneity. This has been confirmed by visual inspection.
- EP231X (TOP) PFAS TOPA: Sample "MW84_DC_0.0-39.0"(EB2323019-022) shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EP231X (TOP) PFAS TOPA: The LOR of PFOS for samples "MW82_SS_0.35-0.45"(EB2323019-002), "MW83_SS_0.20-0.25"(EB2323019-003), & "FD01_SS"(EB2323019-016) has been raised due to matrix interferences.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

C-O-C number	: ----	Issue Date	: 07-Aug-2023
Sampler	: BRIAN LLEWELLYN		
Site	:		
Quote number	: EN/005		
No. of samples received	: 46		
No. of samples analysed	: 45		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2323019**	Page	: 1 of 23
Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: MS MARIA PRSKALO	Telephone	: +61-7-3243 7222
Project	: 12609270	Date Samples Received	: 27-Jul-2023
Site	:	Issue Date	: 07-Aug-2023
Sampler	: BRIAN LLEWELLYN	No. of samples received	: 46
Order number	: ----	No. of samples analysed	: 45

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005(ED093)T: Total Metals by ICP-AES	EB2323019--030	MW83_WB_14.9-19.0	**Manganese**	7439-96-5	28.7 %	0% - 20%	**RPD exceeds LOR based limits**
EP231A: Perfluoroalkyl Sulfonic Acids	EB2323019--001	MW81_SS_0.45-0.50	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	36.9 %	0% - 20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EB2323019--022	MW84_DC_0.0-39.0	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	12.7 %	67.0-130%	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH (1:5)	EA002	SOIL	In house: Referenced to Rayment and Lyons 4A1 and APHA 4500H+. pH is determined on soil samples after a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
Electrical Conductivity (1:5)	EA010	SOIL	In house: Referenced to Rayment and Lyons 3A1 and APHA 2510. Conductivity is determined on soil samples using a 1:5 soil/water leach. This method is compliant with NEPM Schedule B(3).
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Organic Carbon	EP003	SOIL	In house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automatically measured by infra-red detector.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
PFAS by LCMSMS after oxidation (TOP)	EP231X (TOP)	SOIL	In house, following oxidation per Houtz,Erika F.; Sedlak,David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349.: A portion of the oxidised sample is mixed with methanol (1:1) prior to analysis by LC-Electrospray-MS-MS,Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.
PFAS by LCMSMS after SPE and oxidation (TOP)	EP231X-LL (TOP)	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349. Sample extracts are analysed by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of reagent grade water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Dry and Pulverise (up to 100g)	GEO30	SOIL	#
TOP Digest for PFAS on soil extract.	ORG70-S	SOIL	In-House Extraction followed by digestion with oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342-9349. A soil extract is taken to near dryness and made up to 5 mL with reagents. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Total Oxidisable Precuror Digest for PFAS - Low Level	* ORG70-SPE	WATER	In-House SPE followed by oxidation per Houtz, Erika F.; Sedlak, David L. (2012): Oxidative Conversion as a Means of Detecting Precursors to Perfluoroalkyl Acids in Urban Runoff. In Environmental Science & Technology 46 (17), pp. 9342¿9349: A 50 mL sample is concentrated by SPE, taken to near dryness and made up to 5 mL in a reagent solution. The sample is digested with persulfate under alkaline conditions, neutralised and prepared for analysis per EP231.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Quote number	: EN/005		
No. of samples received	: 5		
No. of samples analysed	: 5		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
Timothy Creagh	Senior Chemist - Organics	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**
