EXECUTIVE SUMMARY

CS Energy Limited (CS Energy) operates the Callide Power Station (the site or the station), located approximately nine km north-east of Biloela, Queensland. Aqueous film forming foams (AFFF) containing per- and poly-fluoroalkyl substances (PFAS) have been used historically over the life of the station. Removal of all non-compliant AFFF commenced in late 2018, with all non-compliant AFFF removed from service and disposed to a licensed disposal facility prior to 2019.

Historical information available identifies that potential onsite releases (use) of AFFF at the Callide B and C Power Station site is likely to be less than 1,000L over the life of the station, including use of up to 300L of AFFF concentrate in training activities, system tests and use/maintenance of extinguishers, and a further approximately 500L of AFFF concentrate used in emergency response associated with coal fires at the coal plant. It is noted that a number of events are reported to have been fully contained within onsite bunding and cleaned up by licenced contractors. Limited information was available for use of AFFF at the Callide A Power Station site, which operated between 1965 and 1988. By comparison, the Oakey Army Aviation Centre is reported to have released approximately 1.2 million litres of AFFF concentrate over 25 years of operation[1].

In conjunction with the removal of non-compliant AFFF, CS Energy committed to the Department of Environment and Science (DES, now the Department of Environment, Science and Innovation (DESI)) to undertake a voluntary PFAS Environmental Investigation, to assess potential impacts associated with the former use of PFAS-containing products at the site. Epic Environmental (Epic) was engaged by CS Energy as their suitably qualified person (SQP) to undertake assessment of PFAS at the site as part of this voluntary investigation. Under the voluntary arrangement, CS Energy also submitted an initial monitoring plan to DES and continued to operate in accordance with it.

Initial investigations completed at the site in 2019 targeted existing onsite and offsite groundwater and surface water monitoring locations, with the investigation expanded during 2021 to include sampling of private groundwater supply wells up to 12 km downstream of the site. To date, a total of 158 groundwater monitoring bores and 50 surface water monitoring locations have been sampled. Results from monitoring completed to date report concentrations of the Sum of PFOS and PFHxS above the Australian Drinking Water Guideline (0.07 µg/L) in onsite and offsite groundwater monitoring wells (Sum of PFOS and PFHxS up to 33.50 µg/L and 6.59 µg/L respectively) and onsite and offsite surface water (Sum of PFOS and PFHxS up to 0.595 µg/L and 0.0887 µg/L respectively). All results from sampling completed to date have been provided to DES, Queensland Health, the Department of Agriculture and fisheries (DAF), and the Contaminated Land Auditor (CLA). CS Energy has also provided results to relevant private landholders.

On 15 December 2021, a Notice to conduct or commission an Environmental Evaluation (EE) notice (Reference: EPPR00536313 | CCPLRC-100046232 | E-100046349)(DES, 2021) was formally issued by DES to CS Energy. This notice required CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site.

In accordance with Requirement 5 of the EE, a Contaminated Land Investigation Document (CLID), comprising a site investigation report, was submitted to DES on 7 September 2022. The CLID comprised the following report:

- *Callide Power Station – Contaminated Land Investigation Document (Site Investigation), 7 September 2022 (Epic 2022c)*

Following submission of the CLID, a meeting was held with DES to discuss the seven remaining data gaps detailed in the CLID (data gaps 1 to 7) and agree on a timeframe to complete additional investigation required to address the data gaps. Correspondence received by DES on 4 October 2022 (DES, 2022b) requested CS Energy complete additional works and provide an addendum CLID report to satisfy the Requirement 8 of the amended EE (DES, 2023). A further time extension was granted on 21 August 2023 to complete the additional works, with the final requirement as follows:

[1] Environmental Management of Fire Fighting Foam Policy, Explanatory Notes (Revision 2.2). Department of Environment and Heritage Protection (now DES), July 2016.

Requirement 8: *By 5:00 pm on 8 March 2024 you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.*

Additional investigations have been completed at the site to address data gaps reported in Section 13.2 of the CLID submitted under EE Requirement 5 (Epic 2022c). This addendum CLID has been prepared to detail additional works completed to address the data gaps and recommendations from the initial 2022 CLID, as detailed in an addendum sampling analysis and quality plan (SAQP) (Epic 2023a) included in **Appendix L**. In addition, this report presents results from additional investigation works completed following submission of the CLID on 7 September 2022.

Based on the findings of additional site investigations completed following the submission of the 2022 CLID, the majority of identified data gaps have been investigated to inform the requirements of EE Requirement 5. However, three data gaps (data gaps 4, 6 and 7) partly remain. Investigation results indicated that the site is likely to be contributing to PFAS impacts identified within the receiving environment, including Dunn Creek, Callide Creek and the associated alluvial groundwater aquifer, noting that a number of existing and new measures have been adopted to reduce potential impacts and offsite releases from the site including:

- The seepage recovery network between Ash Dam B (ADB) and Callide Creek, comprising seepage recovery wells located in the western, southern and eastern seepage areas. Current estimates indicate that >70% of seepage is recovered, with fugitive seepage from the combined eastern/southern and western seepage areas estimated to be 145 – 190 m^3/day and 26 m^3/day respectively (EMS, 2024).
    - Five additional seepage recovery bores (MW81, MW82, MW83, MW85 and MW90) were installed in August 2023 at the eastern seepage area to support seepage recovery at the site.
- Removal of seepage at Callide A release point R2 sump to recover seepage collected within the concrete outfall structure.
- Remediation through chemical stabilisation of soils at the Fuel Oil Tanks (FOT) and Fire Training Ground (FTG) with elevated concentrations of PFAS, with approximately 1.3 kg of PFAS chemically stabilised, and reporting a reduction in the leachability of PFAS of >99.7%.
- Removal and offsite disposal of PFAS impacted concrete comprising the former FTG bund, with an estimated 0.1 kg of PFAS removed from the site.

In accordance with Requirements 5(e) and 5(f) of EE E-100046349 several recommendations for additional works have been identified based on the findings of this Addendum CLID, with **Table 1** summarising remaining data gaps and recommendations for the completion of additional works.

Table 1. Summary of Remaining Data Gaps and Recommendations

Data Gap	Remaining Data Gap Details	CLID Recommendations
2 & 3	-	1. Removal of localised impacts within the Northern Stormwater Pond (NSP) at Callide A, to minimise potential migration of PFAS to Dunn Creek. PFAS impacts were reported in accumulated sediment within the NSP in the vicinity of investigation location CA15, with PFAS reported in surface water (SW44), seepage (R2) and groundwater (MW97) likely associated with this localised impact. Removal of sediments from the NSP will also assist in restoring the storage capacity of the NSP and minimise potential contribution to seepage at R2. Following removal of accumulated sediment in the NSP, review of current seepage management at R2 should be completed to determine if additional management controls are required to prevent offsite release of PFAS via this pathway.
4	Investigations completed in the eastern seepage area have confirmed the presence of two seepage pathways, with the nature and extent of seepage	2. Groundwater recovery bores (which have been tested and appropriate recovery results) installed in the eastern seepage recovery area should be

Data Gap	Remaining Data Gap Details	CLID Recommendations
	pathway further established. As part of current investigations, MW84 reported concentrations of PFAS significantly higher than previous results reported in the eastern seepage area. In addition, elevated concentrations of PFAS were reported in a sediment sample collected from the eastern diversion channel. Results for MW84 are not considered to change the current understanding of potential risk associated with the eastern seepage area based on stable concentrations observed in hydraulically downgradient bores MW32 and MW43 (refer Section 8.3). Additional investigation of the following items will assist in further understanding potential risk and informing potential remediation and/or management of PFAS impacts: • Due to the elevated concentrations of PFAS reported in MW84, future assessment to establish the source of impacts is recommended to assist in informing the ongoing management of PFAS in the eastern seepage area. The nearest known PFAS source area to MW84 (with high PFAS concentrations) is the FOT, located approximately 900 m north, however confirmation that PFAS at MW84 is associated with the FOT, and/or the inferred geological fault line has not been established. It is noted that the existing seepage recovery system is likely to include recovery of seepage from this pathway, with additional seepage recovery bores installed in proximity to MW84 and southern portions of the seepage pathway. These additional seepage recovery bores will, when operational, assist in further reducing seepage. • Current investigation results report the reduction of PFAS concentrations along the MW84-MW32-MW43 seepage pathway, however estimates of fugitive seepage from this pathway, and likely concentrations at the discharge point to Callide Creek have not been established. As noted above, seepage from this pathway is expected to be recovered by the existing seepage recovery system, and inclusion of new seepage recovery bores will assist in further reducing fugitive seepage. In addition, concentrations of surface water in Callide Creek at the inferred discharge point to Callide Creek (as represented by SW12) are generally reported at or below the Drinking Water Criteria.	incorporated into the current seepage recovery system to improve seepage recovery rates and further reduce fugitive seepage from the site. Equipping of recovery bores and incorporation into the existing seepage recovery system should be informed by CS Energys' hydrogeologist and consider relevant operational requirements and approvals (noting recovery bore MW90 is located offsite within the Cocups Road road corridor). Based on elevated concentrations of PFAS in MW84, consideration should be given to installation of a groundwater recovery bore immediately adjacent to this location. It is also recommended that a PFAS water treatment plant be incorporated into the existing site water management system. Consideration to be given to the location of such a system: options to consider include: seepage recovery system to treat seepage recovered from the eastern seepage area to remove PFAS prior to pumping into ADB; or installation of additional processing steps to remove PFAS as part of the main site water treatment plant. 3. Further assessment should be undertaken to establish the source of elevated PFAS concentrations reported at MW84 and EDC-SED-6, including assessment of potential association with the FOT and/or the inferred geological fault line, or whether impacts are associated with an alternative source area. 4. Further assessment should be undertaken to assess potential fugitive seepage from the MW84-MW32-MW43 seepage pathway, and likely concentrations at the discharge point to Callide Creek. Assessment should be completed in conjunction with assessment and management of the eastern seepage recovery area noting that seepage from this pathway is expected to be recovered by the existing seepage recovery system, and inclusion of new seepage recovery bores will assist in further reducing fugitive seepage.
6	Concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and western stormwater diversion channels. Additional	5. Management of impacted surface water, groundwater and sediments along the northern site boundary will be required, however it is noted that the source of PFAS impacts is located upstream and offsite and owned by a third party. It is

Data Gap	Remaining Data Gap Details	CLID Recommendations
	investigations have not confirmed the mass flux of PFAS entering the site (refer **Section 10.4**). As such, further investigation will be required to confirm the mass flux of PFAS entering the site via these pathways. It is noted that additional investigation identified two additional watercourses entering the northern site boundary (as represented by BS3 CWE and BS3 CWN). As detailed in **Section 10.4**, CS Energy have commissioned a third party to install engineering solutions at the location of SW33 and SW34 to facilitate monitoring of water flows entering the site along the northern boundary.	recommended that CS Energy work in collaboration with upgradient landowner(s) and DESI to determine appropriate management of identified impacts. Once upstream, offsite impacts have been adequately remediated or managed, measures should be implemented to manage any residual impacts (e.g. removal of impacted sediment).
7	Potential risks to human and ecological health have been identified as detailed in **Section 15.2** and **Section 15.3** respectively. Further assessment of risk is required to quantify potential risks to human and ecological receptors. It is noted this work has commenced with CS Energy commissioning a risk assessor to complete a human health and ecological risk assessment (HHERA) to inform potential risks to ecological receptors.	7. A Human Health and Ecological Risk Assessment (HHERA) should be completed to assess potential risks identified for human health (refer **Section 15.2**) and ecological receptors (refer **Section 15.3**).
-	-	6. Ongoing management of the FOT and FTG areas will be required, with management to be informed by results of remediation and validation works, along with previous investigation of the surrounding area. As part of management of residual soil impacts, the FOT and FTG should be incorporated into CS Energy's Site Permit to Work (PTW) and Penetration Permitting systems.
-	-	8. Monitoring of groundwater and surface water should continue at select groundwater and surface water locations across the site and within the study area to provide ongoing assessment of PFAS. The monitoring locations should target key migration pathways and the receiving environment to monitor potential impacts to human health and ecological receptors. Monitoring should also include monitoring locations which inform the effectiveness of and/or impacts associated with implementation of remediation and management works undertaken at the site. 9. Callide Power Station's Environmental Authority EPPR00536313 Condition 2(G3) outlines the requirements of a groundwater monitoring program and that "The submitted ground water monitoring program must be maintained". It is recommended that the Callide Power Station ground water monitoring program be updated to include: a. Nominated groundwater and surface water locations as identified to provide ongoing assessment of PFAS as outlined in the recommendation above b. PFAS monitoring constituents for each location.

1 INTRODUCTION

CS Energy Limited (CS Energy) currently operate the Callide Power Station (the site or the station) site, located approximately nine km north-east of Biloela, Queensland. Following release of the Queensland Department of Environment and Sciences' (DES's) (now the Department of Environment, Science and Innovation (DESI))Operational Policy[2] for the management of firefighting foam in 2016, CS Energy undertook a review of site operations and identified historical use of per- and poly-fluoroalkyl substances (PFAS). This review identified aqueous film forming foams (AFFF) have been used historically over the life of the station. Removal of all non-compliant AFFF commenced in late 2018, with all non-compliant AFFF removed from service and disposed to a licensed disposal facility prior to 2019.

In conjunction with the removal of non-compliant AFFF, CS Energy committed to DES to undertake a voluntary PFAS Environmental Investigation, to assess potential impacts associated with the former use of PFAS containing products at the site. Epic Environmental (Epic) was engaged by CS Energy as their suitably qualified person (SQP) to undertake assessment of PFAS at the site as part of this voluntary investigation. Under the voluntary arrangement, CS Energy also submitted an initial monitoring plan to DES detailing proposed sampling of groundwater, surface water, sediment and soils.

Initial investigations completed at the site in 2019 targeted existing onsite and offsite environmental monitoring locations, with the investigation expanded during 2021 to include sampling of private groundwater supply wells up to 12 km downstream of the site. To date, a total of 158 groundwater monitoring bores and 50 surface water monitoring locations have been sampled. Results from monitoring completed to date report concentrations of the Sum of PFOS and PFHxS above the Australian Drinking Water Guideline (0.07 µg/L) in onsite and offsite groundwater monitoring wells (Sum of PFOS and PFHxS up to 33.50 µg/L and 6.59 µg/L respectively) and onsite and offsite surface water (Sum of PFOS and PFHxS up to 0.595 µg/L and 0.0887 µg/L respectively). All results from sampling completed to date have been provided to DES, Queensland Health, the Department of Agriculture and fisheries (DAF), and the Contaminated Land Auditor (CLA). CS Energy has also provided results to the relevant private landholders.

A Notice to conduct or commission an Environmental Evaluation (EE) notice (Reference: EPPR00536313 | CCPLRC-100046232 | E-100046349, dated 15 December 2021) (DES, 2021) was formally issued by DES requiring CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site.

In accordance with Requirement 5 of the EE, a Contaminated Land Investigation Document (CLID), comprising a site investigation report, was submitted to DES on 7 September 2022. The CLID comprised the following report:

- *Callide Power Station – Contaminated Land Investigation Document (Site Investigation), 7 September 2022 (Epic 2022c)*

Following submission of the CLID, a meeting was held with DES to discuss the seven remaining data gaps detailed in the CLID (data gaps 1 to 7) and agree on a timeframe to complete additional investigation required to address the data gaps. Correspondence received by DES on 4 October 2022 (DES,2022b) requested CS Energy complete additional works and provide an addendum CLID report to satisfy the Requirement 8 of the amended EE (DES, 2023). A further time extension was granted on 21 August 2023 to complete the additional works, with the final requirement as follows:

Requirement 8: *By 5:00 pm on 8 March 2024 you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.*

Additional investigations required to be completed included further investigation to close data gaps reported in Section 13.2 of the CLID submitted under EE Requirement 5 (Epic 2022c). This addendum CLID has been prepared to detail additional works completed to address the data gaps and recommendations from the CLID, as detailed in an addendum sampling analysis and quality plan (SAQP) (Epic 2023a) included in **Appendix L**. In addition, this report presents results from additional investigation works completed following submission of

[2] Operational Policy: Environmental Management of Fire Fighting Foam. Department of Environment and Heritage Protection (now DESI), 7 July 2016.

the CLID on 7 September 2022. Details of CLID data gaps and recommendations and additional works are outlined in **Section 1.2**. This addendum CLID is to be read in conjunction with the initial CLID (Epic 2022c) and addendum SAQP (Epic 2023a).

1.1 EE Requirements

Section B of the amended EE details several requirements as detailed in **Table 2**. Following submission of the initial CLID in 2022 (refer to Requirement 5 in **Table 2** below), two amended EE notices (DES, 2022 and DES, 2023) were issued which included revised timeframes for completion (i.e. Requirement 8). A copy of the original EE (DES, 2021) and amended EE notices (DES, 2022a and DES, 2023) are included in **Appendix B**.

Table 2. Summary of, and Assessment against EE E-100046349 Requirements (DES, 2023)

Item	EE E-100046349 Requirements (Section B)	Details of Compliance / Comment
1	By **5:00 pm on 17 December 2021** you must engage an independent SQP under the Act to carry out the requirements of this notice. The SQP must demonstrate skills and experience in technical fields such as soil and groundwater contamination assessment and with particular skills relevant to AFFF firefighting foams containing PFAS.	Engagement letter sent to DES on 16 December 2021. SQP details are presented in **Appendix A**.
2	By **5:00 pm on 17 December 2021** you must engage an approved contaminated land auditor to undertake an auditor's function as outlined in Section 568(b) of the Act, to oversee the SQP carrying out the requirements of this notice.	Engagement letter sent to DES on 16 December 2021.
3	By **5:00 pm on 28 February 2022** you must develop and submit a sampling, analysis and quality plan (SAQP) to the department to characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises for the purpose of preparing a site investigation report as defined in section 387 of the Act. This plan must be prepared by a SQP and consented to by a contaminated land auditor. This investigation detailed in the SAQP must, as a minimum:	A SAQP (Epic 2022a) was submitted to DES on 28 February 2022. An addendum SAQP (Epic 2023a) was approved by the CLA on 10 May 2023.
3(a)	evaluate the nature and extent of PFAS contamination likely to have been caused by any direct or indirect release of AFFF from the premises to soil, water, groundwater, sediments and, include biota sampling in Callide Creek adjoining the premises as part of the investigation; and	
3(b)	assess likely pathways of PFAS contamination from the release of AFFF from the premises including, but not limited to, the premises, surface waters, drainage lines, stormwater infrastructure and groundwater in the vicinity of the premises; and	
3(c)	assess the nature of the connectivity/completeness of those likely pathways by, assessing (where applicable) groundwater levels versus surface water levels and connectivity, hydraulic conductivity and groundwater velocity, and evaluate the potential for surface water releases from Callide dam to enhance migration of PFAS contaminants from the site.	
3(d)	the sampling analysis must be generally in accordance with all requirements stated in Requirement 7.	
4	By **5:00 pm on 7 March 2022** you must commence sampling and analysis in accordance with the SAQP required by Requirement 3.	Completed as part of the initial CLID (Epic, 2022c), with works commencing prior to the SAQP issued under Requirement 3 on 28 February 2022.
5	By **5:00 pm on 7 September 2022** you must submit a contaminated land investigation document (CLID) in accordance with the content requirements of section 389 of the Act, that is a site investigation report detailing the findings of the sampling, analysis and quality plan to determine the nature and extent of impact arising from any direct	Initial CLID (Epic, 2022c) submitted to DES on 7 September 2022.

Item	EE E-100046349 Requirements (Section B)	Details of Compliance / Comment
	or indirect release of any hazardous PFAS contaminants from the release of AFFF. The CLID must also include, but is not limited to the following:	
5(a)	Evaluate known historical activities undertaken at the premises which has involved the use, storage (including volume), handling, foam types and potential release of AFFF PFAS containing material;	Refer to the initial CLID (Epic, 2022c).
5(b)	Provide analytical data that characterises the nature of the PFAS at the premises and that which has been released or potentially released to assist in determining the nature and extent of PFAS contamination in the receiving environment;	Previous investigation results and data gaps are presented in the initial CLID (Epic, 2022c). **Section 6** to **Section 14** of this addendum CLID presents the additional investigations conducted and the analytical data associated with each data gap.
5(c)	Provide analysis of potentially affected media including soil, sediment, surface water, groundwater and biota and identify potential pathways for impacts to human and biota receptors;	Analytical data associated with each data gap and additional investigations is presented in **Section 6** to **Section 14.** A revised Conceptual Site Model (CSM), including assessment of source-pathway-receptor linkages is presented in **Section 15**.
5(d)	Provide all monitoring results and an analysis of the extent of PFAS contamination in soils, sediment, surface water, groundwater and biota;	A full copy of all monitoring results is provided in **Table T2** (PFAS in surface and groundwater), **Table T4** (PFAS in Sediment), **Table T5** (PFAS in Soil Ash) and **Table T6** (PFAS Leachability). Laboratory documentation is included in **Appendix K**.
5(e)	Assess the potential for environmental harm (actual or potential) and provide recommendations for the implementation of reasonable and practicable options to prevent or minimise any further releases of PFAS from identified sources and manage and monitor environmental and human health risks; and	A review of actual or potential risk for environmental harm is provided in **Sections 15.2** (Human Health) and **15.3** (Ecological). Recommendations are detailed in **Section 16.3** which recommends the development of a Human Health and Ecological Risk Assessment (HHERA).
5(f)	Provide remediation options to remove the contamination and treat the contamination taking into account the extent of any residual contamination in soils, sediment, groundwater and surface waters that affect the premises or other receptors.	Recommendations for additional works, including remediation and management of residual impacts are detailed in **Section 16.3.** **Section 12** details remediation and validation works completed at the Fuel Oil Tanks (FOT) and Fire Training Grounds (FTG).
6	The investigations required by this notice must meet the requirements for a CLID for the land in accordance with section 389 and 390 of the Act. A CLID must be prepared by a SQP as required by and in accordance with Chapter 12, Part 3 of the Act and be accompanied by an auditor certification that the CLID complies with section 389(1) and (2) of the Act.	This report has been prepared by a SQP (Refer **Section 1.2** is considered to comply with the requirements for a CLID in accordance with the *Environmental Protection Act 1994*.
7	You must ensure that the following requirements, to the extent that they are applicable and specified requirements are not otherwise referred to, are met when conducting the investigation and preparing the report:	Previous investigations along with current investigations detailed in this report are considered to comply with the stated legislation, guidelines and standards.

Item	EE E-100046349 Requirements (Section B)	Details of Compliance / Comment
		References to relevant guidelines are made where applicable.
7(a)	The investigation is conducted in accordance with the following: the Act – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/act-1994-062; The Policy – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/sl-2019-0156; Queensland Water Quality Guidelines (2009) – see https://environment.des.qld.gov.au/management/water/quality-guidelines; Monitoring and Sampling Manual 2018 Environmental Protection (Water) Policy 2009 Version 2 June 2018 see - https://environment.des.qld.gov.au/__data/assets/pdf_file/0031/89914/monitoring-sampling-manual-2018.pdf; National Environmental Protection (Assessment of Site Contamination) Measure 1999 – see http://nepc.gov.au/nepms/assessment-site-contamination; Queensland Auditor Handbook for Contaminated Land – see https://www.qld.gov.au/environment/pollution/management/contaminated-land/auditors/auditor-handbook; Assessment of impact of human health considering the Tolerable Daily Intakes for PFOS, PFOA, and PFHxS recommended by Food Standards Australia New Zealand (FSANZ); Where PFAS are encountered in water bodies at the premise which are accessible to fauna such as birds and mammals, qualitative consideration of water to animal bioaccumulation factors reported in research publications concerning those contaminants in evaluating potential environmental harm to such animals; and assessment of contamination considering guidance provided in the PFAS NEMP[1] – see https://www.qld.gov.au/environment/pollution/management/disasters/investigation-pfas/management-plan.	Investigation completed in accordance with referenced guidelines, as detailed within the report.
7(b)	An assessment of edible portions (biota) must be used in estimating risks of exceeding the tolerable daily intakes, being consistent with the Queensland Health Guideline for sampling and analysis of seafood suitable for human health risk assessments of PFAS contamination (see https://www.qld.gov.au/__data/assets/pdf_file/0032/68684/pfas-fish-sampling-protocol.pdf) and adopting portion sizes recommended by Food Standards Australia New Zealand (FSANZ) in addition to assessment of whole species (biota) to evaluate bioaccumulation risk; and	Details on aquatic biota sampling is presented in **Section 11**, with the Aquatic Biota investigation report included as **Appendix M**. All works were completed in accordance with the nominated guidelines and standards, and the aquatic biota sampling plan is included as **Appendix E** of the initial CLID (Epic, 2022c).
7(c)	Wherever practical, all samples must be analysed by a NATA accredited laboratory (it is noted that in biota sampling this may not be applicable); and	Laboratory analysis for current and previous investigations were completed by Australian Laboratory Services (ALS) (primary laboratory) and Eurofins MGT (Eurofins) (secondary laboratory). Both laboratories are National Association of Testing Authorities (NATA) accredited for the analytical testing completed.
7(d)	The analytical data on all media (soil, sediment, water, groundwater and biota) must include results for sampling to determine total organic fluorine, total oxidisable precursor (TOP) assay, and the suite of 20 to 28 standard fluorinated organic compounds by liquid chromatography-mass spectrometry (LC/MS/MS) available from	Information on laboratory analysis for each data gap and additional investigations is presented in **Section 6** to **Section 14**.

Item	EE E-100046349 Requirements (Section B)	Details of Compliance / Comment
	commercial laboratories reported as the analyses for the resulting perfluorinated carboxylates for C4 to C14 carbon chain length (TOP C4-C14); and	Analysis for Total Oxidisable Precursor Assay (TOPA) and total organofluorine (TOF) has been completed on representative samples for each media to assess the potential presence of PFAS precursor compounds (including TOPA and TOF).
7(e)	Note that as analytical and instrumental improvements are made regarding the analysis for PFAS it is understood that some laboratories are increasing the standard suite which may assist you in distinguishing between the premises sources of PFAS and other potential sources; and	Laboratory analytical suites employed for current and previous investigations are considered sufficient for evaluation of data against the criteria detailed in **Section 4**, with analysis including the standard suite of 28 PFAS compounds.
7(f)	Where TOP Assay is performed, quality assurance checks must include that oxidant exhaustion has not occurred (e.g. reanalysis to determine presence of fluorotelomer); and	As required, QA checks were completed for TOPA analysis completed in accordance with Section 19.2 of the PFAS NEMP (Refer **Table T8** [water] and **Table T9** [soil]).
7(g)	Groundwater bores are constructed in accordance with the Minimum Construction Requirements for Water Bores in Australia (4th edition).	All investigations have been completed from existing groundwater monitoring wells. It is understood that all wells were constructed to minimum requirements at the time, with groundwater monitoring infrastructure progressively installed at the site since 1996. A detailed review of groundwater monitoring infrastructure is included in Appendix H of the CLID (Epic, 2022c) New groundwater monitoring wells, including monitoring wells and recovery bores installed by GHD (refer **Section 14.1**) were completed in accordance with this requirement.
8‡	By **5:00 pm on 8 March 2024** you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.	This report.

Notes: ‡ Requirement from Amended EE (DES, 2022a and DES, 2023)
[1] PFAS National Environmental Management Plan (NEMP), Version 2.0, January 2020. Heads of EPAs Australia and New Zealand (HEPA)

1.2 Data Gaps and CLID Recommendations

The initial CLID submitted to DES (Epic 2022c) identified seven data gaps requiring further investigation. In addition, and in accordance with Requirements 5(e) and 5(f) of the EE, several recommendations for additional works were identified. **Table 3** summarises the data gaps and recommendations presented in the initial CLID.

Table 3. Data Gaps and CLID Recommendations presented in initial CLID (Epic, 2022c)

Data Gap	Data Gap Details	CLID Recommendations
1	Results from soil and sediment investigations at Ash Dam 4 indicate that a localised source of PFAS may be present within Ash Dam 4. Further investigation will be required to determine the nature and extent of potential impacts at Ash Dam 4.	Further investigation should be undertaken at Ash Dam 4 to confirm the nature and extent of PFAS impacts identified in soil and sediment. Results of the investigation should be used to inform any remediation, mitigation, or management measures to be implemented to prevent or minimise potential ongoing risks to ecological and human health receptors (noting Ash Dam 4 is located within the Waste Containment Facility, upstream of ADB).
2	Soil investigations completed at Callide A indicate a localised PFAS impact may be present within the catchment of the Northern Stormwater Pond, with elevated concentrations of PFAS reported in soils (coal ash/dust) within the northern sediment pond along with surface water. Further investigation will be required to determine the nature and extent of potential impacts at the Callide A Northern Stormwater Pond.	Further investigation should be undertaken at Callide A to determine the nature and extent of PFAS impacts identified in the Callide A Northern Stormwater Pond (NSP) and confirm potential linkages with surface water discharges to Dunn Creek. Results of the investigation should be used to inform any remediation, mitigation or management measures to be implemented to prevent or minimise releases of PFAS from the Callide A site.
3	PFAS is reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations, noting limited water is released via R2 and PFAS impacts were also reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine). No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A, with PFAS reported at R2 likely associated with soil impacts identified at the Northern Stormwater Pond. Further investigation will be required to confirm the source of PFAS reported within R2.	
4	Groundwater results indicate that the eastern seepage area likely comprises at least two seepage pathways, one associated with the current seepage pathway and seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32. Further investigation will be required to confirm the nature and extent of seepage pathways at the eastern seepage area.	Further investigation of existing seepage pathways (eastern, southern and western) should be undertaken to confirm the extent of current seepage pathways, identify any additional pathways and confirm linkages with the receiving environment. In particular, further investigation is required to determine the nature and extent of the secondary seepage pathway identified at the eastern seepage area, as represented by MW32. Results of the investigation should be used to inform refinement of the existing seepage recovery systems and/or implementation of additional measures to minimise or prevent seepage releases from the site. It is noted that at the time of reporting, CS Energy has engaged a geophysicist to undertake a geophysical survey of the current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites.
5	Groundwater results from the western seepage area indicate some wells, including MW49, may be outside the current groundwater seepage recovery area. In addition, surface water within the western stormwater diversion channel (carrying stormwater from the north) may infiltrate through alluvial soils in the south-western portion of the site, potentially contributing to PFAS impacts in groundwater. Further investigation will be required to confirm the nature and extent of seepage pathways at the western seepage area along with potential contribution from surface water infiltration.	
6	High concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment	Management of impacted surface water, groundwater and sediments along the northern site boundary will be required, however it is noted that the source of

Data Gap	Data Gap Details	CLID Recommendations
	impacts identified within the northern and western stormwater diversion channels. Further investigation will be required to assess the nature (including mass) of PFAS entering the site via these pathways. It is noted that management of PFAS impacts from these pathways will need to be undertaken in conjunction with remediation and/or management of offsite source areas.	PFAS impacts is located offsite and owned by a third party. On this basis, any remediation or management of impacts identified at the site will need to be in collaboration with upgradient landowner(s) and DES. Temporary PFAS management options should be investigated (i.e. passive sorption water treatment technologies) to determine their suitability for interim management of PFAS impacted surface water, noting adoption and implementation of any technologies should be undertaken in collaboration with upgradient landowners and DES. Once offsite impacts have been adequately remediated or managed, measures should be implemented to manage any residual impacts (i.e. removal of impacted sediment).
7	Potential risks to human and ecological health have been identified (refer **Section 15.2** and **Section 15.3** respectively). Further assessment of risk will be required to be completed to quantify potential risks to human and ecological receptors. It is noted that biota sampling is proposed to be completed (refer Section 11 of the initial CLIDE (Epic, 2022c) to inform potential risks to ecological receptors.	Completion of proposed biota sampling detailed in Section 11 of the initial CLIDE (Epic, 2022c) is recommended to be undertaken during the next wet season period. Sampling should be undertaken in accordance with the sampling plan provided in **Appendix B**. Following completion of biota sampling, a Human Health and Ecological Risk Assessment (HHERA) should be completed to assess potential risks to human health (refer **Section 15.2**) and ecological receptors (refer **Section 15.3**).
-	-	Remediation of PFAS impacted soils identified at the fire training ground and fuel oil tanks should be undertaken to the extent practicable to prevent or minimise potential ongoing risks to ecological and human health receptors. Highest concentration of PFAS were reported in areas immediately surrounding the Fuel Oil Tank bund and the Fire Training Ground bund, and are considered to represent the extent of primary impacts associated with the historical use/release of AFFF. However, it is noted that residual impacts in surrounding areas was reported. At the time of reporting, CS Energy has appointed a remediation contractor to undertake remediation of the FTG and FOT area. Remediation is proposed to comprise onsite stabilisation through addition of a powdered activated carbon product.
-	-	Monitoring of groundwater and surface water should continue at select groundwater and surface water locations across the site and within the study area to provide ongoing assessment of PFAS within key migration pathways (including Callide A/Dunn Creek, the northern and western stormwater diversion channels and the western and eastern seepage areas) and the receiving environment to monitor potential impacts to human health and ecological receptors. Monitoring should also include monitoring locations which inform the effectiveness of and/or impacts associated with implementation of remediation and management works undertaken at the site.

1.3 Roles and Responsibilities

Epic was engaged by CS Energy to perform the function of a SQP in accordance with the requirements of the original and amended EE (refer to Section 1.1). The key roles relating to the project have been summarised in **Table 4** below. A copy of the SQP declaration and supporting documentation is included in **Appendix A**.

Table 4. Key Roles

Aspect	Details
Suitably Qualified Person (SQP)	Mr Luke Amies Epic Environmental Pty Ltd Completion of environmental investigations and reporting requirements of the original and amended EE
Contaminated Land Auditor (CLA)	Mr Mark Stuckey Environmental Earth Sciences Oversee SQP carrying out the requirements of the original and amended EE and undertake an Auditor's Function in accordance with Section 568(b) of the *Environmental Protection Act 1994*.
Recipient / Site Owner	CS Energy Limited Level 12, 31 Duncan Street Fortitude Valley QLD 4006 Commissioning of and compliance with requirements of the original and amended EE.

2 SITE DESCRIPTION AND BACKGROUND

A detailed summary of the site and relevant background information is presented in the initial CLID (Epic 2022c), with a summary of key information and new/updated information presented below.

2.1 Site Identification

The site occupies two land parcels located at Biloela Callide Road, Mount Murchinson as outlined in **Table 5.** Operational areas of the power station are split between the two lots, with the majority of the Waste Containment Facility located within Lot 1 on Registered Plan (RP) 615528 as shown in **Figure 1.**

Table 5. Site Identification

Aspect	Detail	Detail
Lot Details	1 RP615528	4 on Survey Plan (SP) 103557
Address	Biloela Callide Road, Mount Murchison QLD 4715	Biloela Callide Road, Mount Murchison QLD 4715
Area (ha)	631.933	239.200
Site Owner	CS Energy Limited	CS Energy Limited
Local Government Authority	Banana Shire Council	Banana Shire Council
GPS Coordinate (centroid) – Lat/Long GDA2020	-24.34965, 150.60836	-24.33583, 150.62181

Current Use and Main Features	• Callide C and part of Callide B Power Stations and associated infrastructure.
	• The western portion of the current Waste Containment Facility comprising of:
	  • Drains Reclaim Dam (DRD) and the majority of the Evaporation Ponds.
	  • Ash Dam B (ADB) and associated seepage recovery system.
		• Callide A and balance of Callide B Power Stations and associated infrastructure, including an administration building.
		• Coal Plant
		• Ash Dams 1, 2, 3 and 4

Proposed Use	Not determined	Not determined
Zoning	Special Industry	Special Industry
EMR Status	Included on Environmental Management Register (EMR) (refer **Section 2.2**). Not included on Contaminated Land Register (CLR)	Included on EMR (refer **Section 2.2**). Not included on CLR
EMR ID	12271	30829
Environmental Authority	The site currently operates under EA EPPR00536313 and EPPR00707213 for Lot 1 RP615528 and Lot 4 SP103557. The EA's outline the following approved Environmentally Relevant Activities (ERAs) for both lots: • ERA 08 - Chemical Storage, 1: Storing a total of 50t or more of chemicals of dangerous goods class 1 or class 2, division 2.3 under subsection (1)(a) • ERA 08 - Chemical Storage, 3: Storing more than 500 cubic metres of chemicals of class C1 or C2 combustible liquids under AS 1940 or dangerous goods class 3 under subsection (1)(c) • ERA 14 - Electricity Generation, 2: Generating electricity by using a fuel, other than gas, at a rated capacity of, (b) more than 150MW electrical • ERA 56 - Regulated Waste Storage, Receiving and storing regulated waste • ERA 60 - Waste disposal, 1: Operating a facility for disposing of, in a year, the following quantity of waste mentioned in subsection (1) (a), (d) more than 200,000t • ERA 63 - Sewage Treatment, 1: Operating sewage treatment works, other than no-release works, with a total daily peak design capacity of, (b-ii) more than 100 but not more than 1500EP otherwise	

Aspect	Detail	Detail
	Review of historical records indicates two former EAs were issued for the site as follows: • EPPR00248513 (cancelled Feb 2001) – Callide A/B Power Station – ERA: Chemical Storage >10m^3 but <1,000m^3 • EPPR00273613 (cancelled Feb 2001) – Callide A/B Power Station – ERA: Crude Oil Storing >10,000L but <500,000L	

Figure 1. General Site Layout (source: Queensland Government 2024)

2.2 Environmental Management Register

Lot 1 RP615528 is listed on DESI's EMR) (EMR ID: 12271) for the following Notifiable Activities and/or Hazardous Contaminants:

- Petroleum Product or Oil Storage
- Chemical Storage
- Coal Fire Power Station
- Waste Storage, Treatment or Disposal
- Hazardous Contaminant: Asbestos and synthetic mineral fibres

Lot 4 SP103557 is listed on DES's EMR (EMR ID: 30829) for the following Notifiable Activities:

- Asbestos Manufacture or Disposal
- Petroleum Product or Oil Storage
- Chemical Storage
- Coal Fire Power Station
- Waste Storage, Treatment or Disposal

Following identification of PFAS at the site, notification was provided to DES on 17 November 2020. Further notification was provided on 1 December 2020 and 5 February 2021 based on results of further investigations undertaken at the site.

The EMR listing for Lot 1 RP615528 was updated on 20 November 2023 to include the presence of a hazardous contaminant (asbestos and synthetic mineral fibres), with a copy of the EMR notice for Lot 1 (20 November 2023) and the EMR search result for Lot 4 (5 September 2022) included in **Appendix C**.

Lots 1 RP615528 and 4 SP103557 are not included on the CLR.

2.3 Site History, Layout, Background and Previous Investigations

Details on the history, layout, background and previous investigations completed at the site are presented in the Initial CLID (Epic, 2022c). For the purposes of this addendum CLID, key aspects associated with the site are consistent with those reported in the initial CLID (Epic, 2022c), with additional information relevant to the current PFAS environmental investigation presented in **Section 6** to **Section 14**.

During the investigation period (October 2022 to December 2023) the site continued to operate as a Coal Fired Power Station in accordance with the site's EA (EPPR 00536313 and EPPR 00707213). While some site conditions have changed throughout the investigation period (i.e. demolition and construction of the Callide C cooling towers, rebuilding of Callide C turbine and generator), these aren't considered to materially impact the aspects related to this investigation and/or change details presented in the Initial CLID (Epic, 2022c).

3 DATA QUALITY OBJECTIVES (DQOS)

The DQOs process is a planning tool developed to ensure that any data collected is of sufficient quality and quantity to support defensible decision making. It is a process used to define the type, quantity and quality of data needed to support decisions relating to the environmental condition of a site and provides a systematic approach for defining the criteria that a data collection design should satisfy.

It is recognised that the most efficient way to accomplish these goals is to establish criteria for defensible decision making before the data collection begins, and then develop a data collection design based on these criteria. Using the DQOs process to plan the data collection assists in improving the effectiveness, efficiency and defensibility of a decision in a resource and cost-effective manner.

DQOs were developed in accordance with US EPA 2000[3] and 2006[4] to detail the type of data that is needed to satisfy the overall project objectives to inform the principal study questions identified for the site including:

- What is the nature and extent of PFAS contamination associated with direct or indirect releases of AFFF?
- What are the likely pathways associated with PFAS contamination at the site to other areas of the site, surface waters, drainage lines, stormwater infrastructure and groundwater?
- What are the likely pathways associated with PFAS to human and biota receptors?
- For pathways identified, what is the nature of the connectivity/completeness of these pathways?
- What is the nature and extent of any environmental harm (actual or potential) arising from the direct or indirect release/use of PFAS into the environment?

A summary of the DQO outputs are presented in **Appendix F** (sourced from Section 5 of the Addendum EE SAQP (Epic 2023a)), with a summary of investigation results presented in the following sections.

[3] US EPA (2000), Data Quality Objectives, Process for Hazardous Waste Site Investigations, EPA QA/G-4HW, (Ref. EPA/600/R-00/007).
[4] US EPA (2006), Guidance on Systematic Planning Using the Data Quality Objectives Process, EPA QA/G-4, (Ref. EPA/240/B-06/001).

4 ASSESSMENT CRITERIA

4.1 Groundwater and Surface Water Assessment Criteria

Groundwater and surface water analytical data have been compared against relevant assessment criteria with regards to human health and the environment. The adopted assessment criteria, along with guidance documents used to establish the screening/investigation levels are summarised in **Table 6**.

Table 6. Adopted Groundwater and Surface Water Assessment Criteria

Media	Potential Contaminant of Concern	Criteria	Potential Receptor	Description	Guideline Source
Groundwater and Surface Water	Sum of PFOS and PFHxS	0.07 µg/L	Human Health	Drinking Water	• Australian Drinking Water Guidelines 6, 2011 (v3.8 September 2022) • PFAS National Environmental Management Plan (v2.0 January 2020)
	PFOA	0.56 µg/L			
	PFOS/PFHxS	2 µg/L		Recreational Water	• NHMRC Guidance on Per and Polyfluoroalkyl substances (PFAS) in Recreational Water (2019) • PFAS National Environmental Management Plan (v2.0 January 2020)
	PFOA	10 µg/L			
	PFOS	0.00023 µg/L	Ecological	99% species protection	PFAS National Environmental Management Plan (Freshwater)
	PFOA	19 µg/L			
	PFOS	0.13 µg/L		95% species protection	PFAS National Environmental Management Plan (Freshwater)
	PFOA	220 µg/L			

Concentrations were compared to 99% Species Protection Guideline Values due to the proximity of the site to sensitive environmental receptors including Callide Creek and the potentially bioaccumulative nature of PFAS[5], with results also compared to 95% Species Protection Levels to indicate likely impacts to environmental values (direct toxicity), noting that the 99% Species Protection Levels may be below ambient background concentrations.

4.2 Soil and Sediment Assessment Criteria

Soil and sediment analytical data was compared against relevant assessment criteria with regards to human health and the environment. The adopted assessment criteria, along with guidance documents used to establish the screening/investigation levels are summarised in **Table 7.**

It is noted that while no sediment specific PFAS guideline exists, the use of soil criteria is deemed suitable for assessment based on the site setting and nature of sediment encountered at the site (generally comprising accumulated soil material deposited in drainage pathways as a result of erosion and transport via overland flow).

[5] NEMP 2018, Table 5: The WQG advise that the 99% level of protection be used for ...slightly to moderately disturbed systems'. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife.

Table 7. Adopted Soil and Sediment Assessment Criteria

Media	Potential Contaminant of Concern	Criteria	Potential Receptor	Description	Guideline Source
Soil and Sediment	PFOS/PFHxS	1 mg/kg	Human Health	Public Open Space [offsite soils/ sediments]	PFAS National Environmental Management Plan Soil
	PFOA	10 mg/kg			
	PFOS/PFHxS	20 mg/kg		Industrial / Commercial [onsite soils/ sediments]	PFAS National Environmental Management Plan Soil
	PFOA	50 mg/kg			
	PFOS	1 mg/kg	Ecological	Ecological Direct Exposure	PFAS National Environmental Management Plan Interim Soil
	PFOA	10 mg/kg			
	PFOS	0.01 mg/kg		Ecological Indirect Exposure (Residential) [offsite soils/ sediments])	PFAS National Environmental Management Plan Interim Soil
		0.14mg/kg		Ecological Indirect Exposure (Industrial / Commercial) [onsite soils/ sediments]	

5 METHODOLOGY

The adopted methodology for collection of samples was completed in accordance with Requirement 7 of the EE, and the requirements of Addendum EE SAQP (Epic, 2023a).

5.1 Groundwater and Surface Water Sampling Schedule

Groundwater and surface water sampling was completed in accordance with the Addendum EE SAQP (Epic, 2023a) as detailed in **Table 8**.

Table 8. Groundwater and Surface Water Monitoring Program

Sampling Scope	Area of Interest	Sample Locations	Proposed Sampling Schedule				
			Q1 [Feb/Mar23]	Q2 / Dry Season / Annual Event [May/Jun23]	Q3 [Aug/Sep23]	Q4 / Wet Season Event [Nov/Dec23]	Rainfall Event (>25mm) [A]
Groundwater	Northern Site Boundary	MW74	X	X	X	X

		SW41		X		X	

Notes: [A] – event-based sampling is to occur within 72 hours of a rain event >25mm (72 hr) as recorded onsite, with sampling to be limited to one event per month
[1] Landowner groundwater supply bore
[2] Department of Resources monitoring bore

Following installation of additional groundwater monitoring and recovery wells (refer to **Section 14.1**), MW81 to MW85, MW89 to MW91, MW94 and MW98 were included as part of the quarterly monitoring scope.

5.2 Soil Sampling Methodology

Sampling of soil was completed in accordance with methodology detailed in **Table 9**.

Table 9. Soil Sampling Methodology

Action	Description
Permit to Work	Soil sampling was completed under a Site Permit to Work (PTW) and a Digging, Excavation and Building Penetration Checklist. Permits were obtained in accordance with the CS Energy Permit to Work Manual (CS-PTW-01) and Digging, Excavation and Building Penetration (CS-PTW-HAZ-04) prior to the commencement of works.
Soil Sampling	Soil samples were generally collected using a drill rig utilising single-use disposable pushtubes and/or solid flight augers, with drilling terminated at target depth or prior refusal. Soil samples were collected directly from the pushtube sleeve or auger flight, directly from the soil surface or from material returned on the hand auger using disposable nitrile gloves, which were replaced between the collection of each sample. The soil samples were immediately transferred into laboratory supplied PFAS sampling containers.
Soil Logging	Logging of investigation locations was conducted in general accordance with the Unified Soil Classification System and AS 1726-1993. Descriptions were recorded on Epic's standard field log sheets for uniformity in descriptions, presentation and to aid in future interpretations.

Field QA/QC	Field intra- and inter-laboratory duplicates of soil samples were prepared in the field by collecting blind and split samples from the same depth. Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Decontamination	Soil sampling was completed using dedicated disposable equipment (pushtubes) along with decontaminated solid flight augers, and a hand auger where access was limited. Reusable equipment was decontaminated by hand between each sampling location and event which included scrubbing thoroughly with a plastic brush and rinsing with clean water followed by a triple-rinse in deionised water. Rinsate samples were collected where necessary from reusable equipment to verify effectiveness of the decontamination.

5.3 Sediment Sampling Methodology

Sampling of sediment was completed in accordance with methodology detailed in **Table 9**.

Table 10. Soil Sampling Methodology

Action	Description
Permit to Work	Sediment sampling was completed under a Site Permit to Work (PTW) and a Digging, Excavation and Building Penetration Checklist. Permits were obtained in accordance with the CS Energy Permit to Work Manual (CS-PTW-01) and Digging, Excavation and Building Penetration (CS-PTW-HAZ-04) prior to the commencement of works.
Sediment Sampling	Sediments from drainage lines (including the EDC) were collected by hand using a new nitrile glove at each location, targeting a depth of approximately 100-150mm below the top of the sediment. Where deeper profiles were observed, sampling was completed by hand auger or test pit as detailed below.
Field QA/QC	Field intra- and inter-laboratory duplicates of soil samples were prepared in the field by collecting blind and split samples from the same depth. Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Decontamination	Soil sampling was completed using dedicated disposable equipment (pushtubes) along with decontaminated solid flight augers, and a hand auger where access was limited. Reusable equipment was decontaminated by hand between each sampling location and event which included scrubbing thoroughly with a plastic brush and rinsing with clean water followed by a triple-rinse in deionised water. Rinsate samples were collected where necessary from reusable equipment to verify effectiveness of the decontamination.

5.4 Surface Water Sampling Methodology

Sampling of surface water was completed in accordance with methodology detailed in **Table 11**.

Table 11. Surface Water Sampling Methodology

Action	Description
Sampling Timing	Surface water sampling was completed on a quarterly, seasonal (wet/dry) or annual basis in accordance with the sampling schedule in **Section 5.1**. Additionally, event-based sampling was to occur within 72 hours of a rain event >25mm (recorded onsite) to a maximum of one event per month.
Surface Water Depth Monitoring (Northern Boundary)	Monitoring of surface water flow has been completed through the installation of LoRaWAN Distance Detection Sensor: LDDS75. The sensor was used to detect the distance between the measured object (water level) and the sensor.
Surface Water Sampling	Surface water sampling was conducted using a decontaminated telescopic sampling pole or by directly submerging laboratory PFAS compliant containers into the water body. Samples were collected in laboratory prepared sample bottles attached to the pole with the lid open and lowered with the opening facing downwards into the water. Where possible the sample bottle was lowered to at least 30cm beneath the water surface and at least 30cm from the base of the water body, with care taken not to disturb any sediments during this process. The sample bottle was then rotated so as to sample water

	from the centre of the water column. Once full, the bottle was carefully removed and sealed. Where suspended solids were observed within the recovered sample, it was allowed to settle prior to decanting into a separate laboratory prepared bottle. Water quality parameters recorded in the field included dissolved oxygen, temperature, EC, redox potential, turbidity and pH, measured using a calibrated water quality meter.
Field QA/QC	Field intra- and inter-laboratory duplicates of the surface water samples were collected in the field by collecting blind and split samples from the same location. Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Sample Labelling, Storage and Transport	All samples were clearly labelled with unique identification numbers consisting of the date, sample location and samplers' initials. Samples were then bagged and kept in an ice filled Esky prior to dispatch and during transport to the NATA registered laboratory, under chain-of-custody procedures. By prior arrangement with the laboratory, samples were extracted and analysed as soon as practicable after receipt.
Decontamination	Reusable equipment was decontaminated by hand between each surface water sampling location by scrubbing thoroughly with a plastic brush and rinsing with clean water and a triple-rinse in deionised water. If required, equipment was scrubbed with a solution of Liquinox (a PFAS approved detergent) followed by a rinse in deionised water.

5.5 Groundwater Sampling Methodology

Sampling of groundwater was completed in accordance with methodology detailed in **Table 12**.

Table 12. Groundwater Sampling Methodology

Action	Description
Groundwater Bore Installation	Groundwater bore construction was undertaken by an appropriately licenced driller and was consistent with the Minimum Construction Requirements for Water Bores in Australia (National Uniform Drillers Licensing Committee (NUDLC) 2020). Groundwater bore construction details are provided on the Epic borelogs in **Appendix I**.
Groundwater Bore Development	The groundwater bores were developed using an electric submersible centrifugal pump to remove sediment load and encourage connectivity with the surrounding aquifer matrix. A minimum of five bore volumes was removed, with wells developed until physicochemical parameters stabilised[A]. Groundwater development sheets are provided in **Appendix J**.
Groundwater Bore Surveying	Groundwater bores were surveyed by a licenced surveyor to enable accurate measurement of standing water levels (SWL) in m Australian Height Datum (AHD).
Sampling Timing	Groundwater sampling was completed on a quarterly, seasonal (wet/dry) or annual basis in accordance with the sampling schedule in **Section 5.1**
Monitoring Well Gauging	Measurement of the SWL was completed at each groundwater monitoring well using an electronic interface probe prior to the commencement of purging. SWL was measured throughout groundwater bore purging to enable the minimisation of drawdown. Due to the pre-existing headworks present on landholder bores (L005-B01, L006-B05, L012-B01 and L021-G01), the SWL could not be measured at these locations.
Monitoring Well Sampling – CS Energy and DRDMW wells	Sampling of existing groundwater monitoring wells was completed utilising appropriate sampling methods based on the findings of the groundwater monitoring network review (Epic 2022c). Sampling methods included High Density Polyethylene (HDPE) HydraSleeves™ or a submersible pump in accordance with the methods outlined below. Sampling methodologies for new groundwater monitoring wells were determined in accordance with Epic 2022c.
	Sampling of monitoring wells utilising HDPE HydraSleeves™ (MW40, MW49, MW74, MW75, MW79, MW80, ESC4[6]) was completed as follows: • Groundwater depth and total well depth were measured and recorded to determine the appropriate length of bail cord to ensure the HydraSleeve™ was positioned a sleeve-length below the top of the screen interval • The HydraSleeve™ was lowered into the well slowly (less than 15 cm per second) to prevent water entering the HydraSleeve™ prematurely

[6] Refer Sections 7.1.1, 7.5.1 and Appendix H of the CLID (Epic, 2022c)

Action	Description
	• The HydraSleeve™ was left at depth in the well for at least 24 hours to allow for stabilisation • Following the stabilisation period, the HydraSleeve™ was recovered from the well by pulling the cord upward at a rate of approximately 30 cm per second, allowing the top check valve to open and groundwater within the screened well casing to enter the HydraSleeve™ (the check valve closes when the HydraSleeve™ is full) • Samples were collected by transferring the groundwater from the HydraSleeve™ to sample bottles by piercing the sleeve (approximately 1/3 of the way from the base) with the provided disposable High Density Polyethylene (HDPE) straw. Where suspended solids were observed within the HydraSleeve™, it was allowed to settle prior to decanting. • Samples were collected directly from the HydraSleeve™ into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged).
	Sampling of groundwater monitoring wells utilising low flow techniques was completed as follows: • The pump inlet was set within the screened interval of the well during purging and sampling • Prior to sampling, monitoring wells were purged using a submersible pump at a rate <1 L/min • Continuous monitoring of the water level was completed with an interface probe during purging and sampling, with pumping rates adjusted to ensure minimal drawdown • Purging continued with frequent water quality measurements recorded until parameters stabilised • Sampling of the monitoring wells was completed using the submersible pump and dedicated HDPE tubing following stabilisation [A]. Samples were collected directly from the tubing into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged). • Where suspended solids were observed within the recovered sample, it was allowed to settle prior to decanting into a separate laboratory prepared bottle.
	Sampling of groundwater monitoring wells using a submersible pump was completed as follows: • The pump inlet was set within the screened interval of the well during purging and sampling • Prior to sampling, monitoring wells were purged using a submersible pump. • Purging continued with frequent measurements of the water quality until parameters stabilised [A] or the well was purged dry. • Sampling of the monitoring wells was completed using the submersible pump and dedicated HDPE tubing following stabilisation or recovery (where purged dry). Samples were collected directly from the tubing into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged). • Where suspended solids were observed within the recovered sample, it was allowed to settle prior to decanting into a separate laboratory prepared bottle
Monitoring Well Sampling – Private Abstraction Wells	Samples at private wells were collected as follows: • Samples were collected directly from the bore pump at the nearest tap or suitable outlet. Prior to sampling, the pipework was purged with a minimum of one well volume removed (if well volume known) or by purging for at least 10 minutes prior to sampling. • Samples were collected directly from the outlet into laboratory prepared bottles. All bottles were sealed immediately using a non-Teflon lined cap (for PFAS), labelled and placed on ice (double bagged).
Field QA/QC	Field intra- and inter-laboratory duplicates of the groundwater samples were prepared in the field by collecting blind and split samples from the location. Duplicate sample pairs

Action	Description
	were collected and analysed at a rate of 1 in every 10 primary samples in accordance with the PFAS NEMP.
Sample Labelling, Storage and Transport	All samples were clearly labelled with unique identification numbers consisting of the date, sample location and samplers' initials. Samples were then bagged and kept in an ice filled esky prior to dispatch and during transport to the NATA registered laboratory, under chain-of-custody procedures.
Decontamination	Reusable equipment, including the water level meter and groundwater pumps, were decontaminated by hand between each groundwater sampling location by scrubbing thoroughly with a plastic brush and rinsing with clean water and a triple-rinse in deionised water.

Notes: [A] – Stabilisation determined based on three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Groundwater Sampling Procedures, April 1996 (ref. EPA/540/S-95/504) including ±0.1 pH, ±3% EC, ±10 millivolts (mv) Oxidation-reduction potential (ORP) and ± 10% Dissolved Oxygen (DO).

6 ASH DAM 4 (DATA GAP 1)

Previous investigations completed at Ash Dam 4 (AD4) reported concentrations of PFAS above the laboratory's Limit of Reporting (LOR) in five of the 17 samples analysed, with one sample (AD401-0.5) reported above the ecological indirect criteria of 0.01 mg/kg (refer to previous investigation in Table 13). It was reported that areas of AD4 adjacent to bore AD401 were used to dispose road sweeping and vacuum excavation spoil, with PFAS concentrations reported at this location considered to be associated with localised disposal of spoil from these activities. Results from sediment sampling completed from the coal plant (located east of AD4)/AD4 drainage line supported that a localised source of PFAS may be present within AD4.

An additional soil investigation was undertaken at AD4 in accordance with the addendum SAQP (Epic 2023a, **Appendix L**) to determine the nature and extent of potential impacts at AD4.

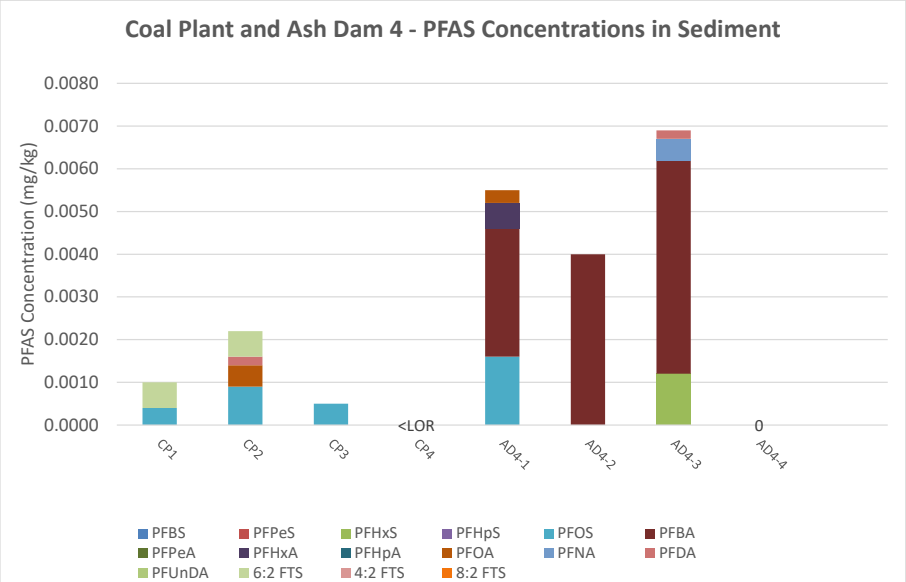
A summary of the identified data gap and background information associated with the AD4 investigation is presented in **Table 13**.

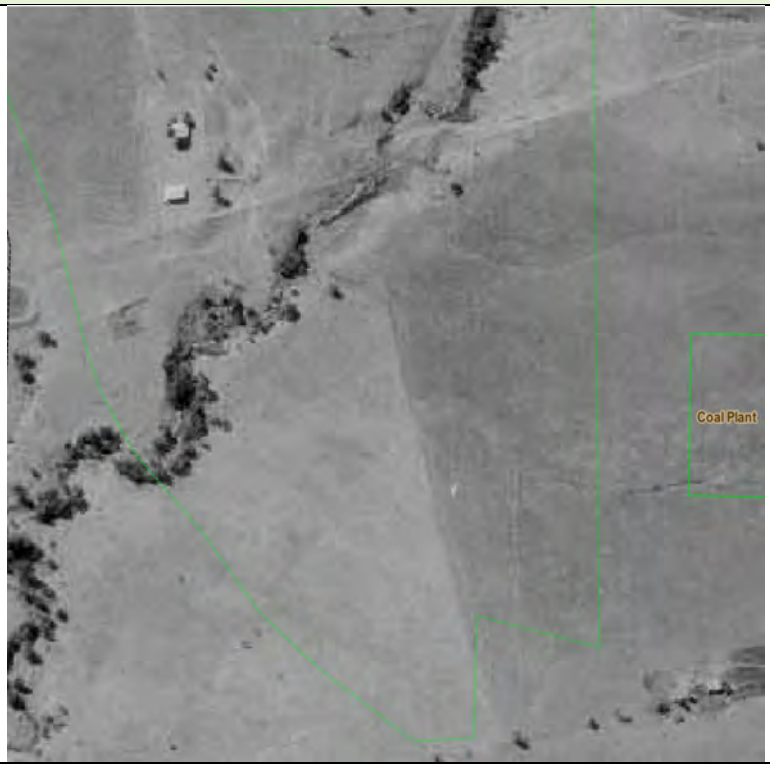
Table 13. Ash Dam 4 (Data Gap 1) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	Results from soil and sediment investigations at AD4 indicate that a localised source of PFAS may be present within AD4. Further investigation will be required to determine the nature and extent of potential impacts at AD4.
Initial CLID Recommendation (Epic, 2022c)	Further investigation should be undertaken at AD4 to confirm the nature and extent of PFAS impacts identified in soil and sediment. Results of the investigation should be used to inform any remediation, mitigation or management measures to be implemented to prevent or minimise potential ongoing risks to ecological and human health receptors (noting AD4 is located within the Waste Containment Facility (WCF), upstream of Ash Dam B).
Background and History	AD4 was commissioned in 1979 to service Callide A Power Station, transitioning to service Callide B in approximately 1988. AD4 remains part of the ash/water management of Callide B Power Station. AD4 is located within the WCF (**Figure F1**) and is reported to have had a capacity of approximately 1,200 megalitres (ML), with the crest of the dam wall located at 239.5 m AHD and a total depth of approximately 10 m. The spillway for AD4 is located at 238.5 m, with surface water and potential seepage discharging to the northern end of the Drains Reclaim Dam (DRD). Notably, the Environmental Authority (EA, EPPR 00536313) for the site authorises the release of ash and effluent to the WCF, where AD4 is located, from the following sources: • The sedimentation dams • Effluent from the chemical drains • Demineralisation and treatment plant • Callide C blowdown water • Cooling tower blowdown • Effluent from chemical cleans • Washdown waters • Quantities of oils and petroleum products that will not cause environmental harm • Dirty drains • Boiler blowdown • Blowdown water treatment plant • Ash Dam B seepage pond waters • Coal plant wastes • Cooling tower sludges • Waste ion exchange resins • Bag filters (and including the bag filters) • Laboratory drains • Callide A and B station sewage effluent
Previous Investigation	Intrusive investigation of AD4 was completed through three boreholes (AD401-03) as part of the EE scope of works (Epic, 2022c), with its location shown in **Figure F4**. These bores were placed to target the northern, central and southern ash disposal areas. A summary of the investigation is as follows:

- From the samples collected, one (AD401-0.5) reported concentrations of PFOS (0.0143 mg/kg) above the ecological indirect criteria of 0.01 mg/kg, with Sum of PFOS and PFHxS (0.0155 mg/kg) exceeding the HIL-A criteria of 0.01 mg/kg, but below the HIL-D criteria. Sample AD401-0.5 also reported detection of PFHxA (0.0004 mg/kg).
  - It is understood that areas of AD4, adjacent to bore AD401, are used to dispose road sweeping and vacuum excavation spoil generated from across current operational areas of the site.
  - It was concluded that PFAS concentrations likely to be associated with disposal of other materials/wastes in accordance with EA, rather than impacts within the ash material.
- Results from the sediment collected in drainage channels adjacent to coal stockpile / Coal Plant (upstream) and AD4 (downstream) reported an increase in PFAS concentrations and change in PFAS composition between both locations (**Figure 2**).
  - All results were reported below the adopted assessment criteria of 0.01 mg/kg (Sum of PFOS and PFHxS), however results indicated that a localised source of PFAS may be present within AD4 noting elevated concentrations of PFAS in sediments within the AD4 drainage channel (refer **Figure 2**).
  - It was noted that soil investigations reported elevated concentrations of PFAS in the north-eastern corner of AD4, which may be associated with these PFAS detected in sediments. It is also noted that overland flow from the waste oil store and western areas of the Coal Plant can drain towards these drains surrounding AD4.





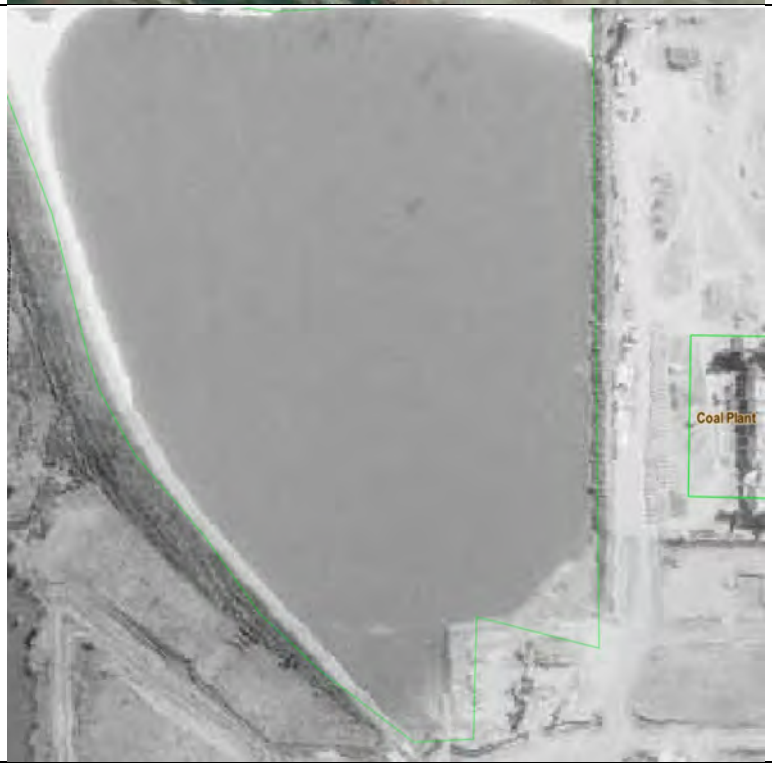


Figure 2. Coal Plant and AD4 – PFAS Concentration in Sediment (Epic, 2022c)

Historical Aerial Photograph Review	As the filling history of AD4 is unclear, a supplementary historical aerial image review was completed to identify the nature of filling and identify any areas of interest. A summary of this review is presented in **Table 14** with the full historical aerials presented in the addendum SAQP (Epic 2023a) included as **Appendix L**. Based upon this review, the following areas of interest were identified for further investigation: • AD4 was built over the former alignment of Suicide Gully (imagery from 1977 – 1981) • Potentially bunded pads (imagery from 1999) filled with a potential slurry of unknown nature • Nature of material used for the construction of the internal dam wall (imagery from 2004) • Machinery storage immediately north of the belt conveyor tower (imagery from 2012) • Potential use of AD4 as a temporary coal stockpile (imagery from 2017) with the potential for spontaneous combustion requiring extinguishment • Windrowed material stockpiles of a distinct red/orange colour (imagery from 2021)

Table 14. Historical Aerial Review: AD4

Table reproduced from Addendum SAQP (Epic 2023a)

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1977		Callide B Power Station has not been constructed. The area prior to the construction of the station is primarily used for grazing with small structures (potential house and shed) located north of the watercourse. The watercourse of Suicide Gully is visible bisecting the area of AD4.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1981		The dam walls associated with AD4 are being constructed with significant amount of earthworks visible to the south and east of the dam. Potential cenospheres are visible floating on the surface along the margins of the dam, potentially from Callide A. The watercourse of Suicide Gully has been filled in and is no longer visible.
1984		Construction of the adjacent areas is continuing and has extended further north. Construction of the coal plant has commenced. A larger volume of water is present within the dam identifiable by the inundation of the northern section of the dam, previously visible.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1988		Construction of the adjacent areas are complete with the belt conveyor and coal plant visible. Potential bottom ash (dark grey) is visible filling the northeastern and eastern margins of the dam, with the lighter cenospheres visible across the surface of the water.
1994		Progressive filling of the dam has continued with the volume of water reduced. A darker coloured material (potentially carbonaceous) is filling the dam in the northern and southern areas.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
1999		Filling has continued of the dam, with water confined to the western margin of the dam. Two bunded areas (red) are visible in the eastern area of the dam with an unknown material used to fill the area. Vegetation regrowth across the surface of the filled dam is visible in the north and southern areas.
2004		Construction of an internal dam wall is visible with earthworks highlighted in red. A belt conveyor extension has been built in the southern corner of the dam, likely associated with the operations at Callide C. The surface area of water has continued to reduce, and a brown discharge is visible from a potential outlet in the southwest corner of the dam.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2012		Filling of the internally constructed dam has continued, likely with ash (grey) and carbonaceous material (black). Vegetation regrowth has continued at the top of the ash dam. Machinery and mechanical parts are visible north of the belt conveyor tower (Red). A water course has been excavated in the northern area of the dam.
2017		Stockpiling of coal is visible in the eastern portion of AD4.

Year	Image With Approximate Location of Site Features	Changes Since Previous Image
2021		The watercourse in the northern portion of the dam has been filled and has been channelised linking to the remaining water body in the west of the dam. Windrowed stockpiles of soil are visible in the north (red), unlikely to be ash based upon colour.

6.1 AD4 Investigation Scope

Soil sampling was undertaken in accordance with the addendum SAQP (Epic 2023a), with the sampling methodology adopted outlined in **Section 5** (**Table 9**). Sampling was completed on 30 and 31 May 2023, with details on soil investigation locations presented in **Table 15.** Soil investigation locations are presented on **Figure F4** with soil bore logs provided in **Appendix I** and laboratory documentation provided in **Appendix K**.

Table 15. AD4 Additional Soil Investigation Scope

Investigation Area/Target	Identified Risk/Target	Sample Details
Former Suicide Gully	Area north of the current stormwater channel to characterise filling of the historic Suicide Gully	• Four bores (AD409, AD410, AD411 and AD412) drilled in the northern extent of AD4 (north of the coal plant stormwater drain) to depths between 4.8 – 8.0 m • Three bores (AD409, AD410 and AD412) drilled from the side of existing roadways due to access constraints • Two bores (AD410 and AD411) completed using a combination of pushtubes (to 4.8 m depth) and solid flight augers (to termination depths of 6.0 m and 8.0 m depth respectively)
AD402	Area between AD401 and AD402 to delineate the concentrations detected in AD402	• Two bores (AD404 and AD405) drilled west/southwest of AD401 to the target depth of 10 m.
Windrowed Stockpiles (2021)	Area of windrowed stockpiles (2021) identified in the historical aerial imagery review	• One bore (AD414) drilled adjacent to windrow area to the target depth of 10 m. • One surface sample (AD413) collected from windrowed material
Western Area	Western area of AD4 to provide additional characterisation	• One bore (AD415) drilled along westernmost portion of current ash fill platform (approximate

Investigation Area/Target	Identified Risk/Target	Sample Details
		location of internal dam wall observed in 2004 aerial photograph) • Bore AD415 completed using combination of pushtubes (to 4.8 m depth) and solid flight augers (to termination depth of 10.0 m)
Machinery Storage (2012)	Area formally used for storage of machinery (2012) identified in the historical aerial imagery review	• One bore (AD406) drilled in area of former machinery storage • Bore AD406 completed using combination of pushtubes (to 4.8 m depth) and solid flight augers (to termination depth of 9.0 m)
Bunded Areas (1999)	Potentially bunded area identified in the 1999 historical aerial imagery review	• Two bores (AD407 and AD408) drilled targeting the northern (AD408) and southern (AD407) bunded areas visible in the 1999 aerial photograph. Bore AD408 also completed between AD401 and AD402 • Both AD407 and AD408 completed using combination of pushtubes (to 4.8 m depth) and solid flight augers (to termination depth of 10.0 m)

6.1.1 Deviations from the Addendum SAQP

Due to access restrictions as noted in **Table 15**, the proposed addendum SAQP locations were modified to areas accessible using a 4WD mounted drilling rig. One surface sample (AD413) was collected from windrowed material located in the area of proposed bore AD413. Due to the presence of windrowed soil material, the area was unable to be accessed by the drilling rig.

6.1.2 Field QA/QC

Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples as part of the wider investigation scope in accordance with the PFAS NEMP (refer **Section 4**), with 3 duplicate pairs collected for a total of 26 primary samples collected during additional investigations at AD4. Further discussion of field duplicates is presented in **Appendix F**.

6.2 AD4 Observations and Analytical Results

Soil analytical results are presented in **Table T5**, with a summary of results presented in **Table 16**. Further discussion on investigation findings is presented in **Section 6.3**. Historical investigation results from AD4 are presented in **Table T4** (sediment) and **Table T5** (soil).

Table 16. AD4 Soil Investigation Results Summary

Investigation Scope	Identified Risk/Target	Observations	Analytical Results
Initial CLID Soil Investigation (June 2022)	Assessment of potential residual PFAS impacts in ash material and other site generated wastes disposed in Ash Dam 4	Investigation locations within Ash Dam 4 encountered a discontinuous alternating profile of pumped ash, bottom ash (with slag), carbonaceous clays and coal to a maximum depth of 8.4 m (AD401) to greater than 10 m in AD402 and AD403 (limit of investigation). Saturated conditions were encountered between 3.5 and 4.0 m, perched on top of the underlying natural clays (only encountered in AD401).	• All locations reported concentrations of PFAS above the LOR, with concentrations reported below the assessment criteria • AD401-0.5 located in the north-eastern corner of Ash Dam 4 reported concentrations of Sum of PFOS and PFHxS above the HIL-A criteria, but below the HIL-D criteria • Both AD401 and AD402 reported detectable concentrations of PFHxS and PFOS. Additionally, AD401 reported concentrations of PFHxA • AD403 only reported detectable concentrations of PFOS
Addendum CLID Soil Investigation (May 2023)	Targeted assessment of potential PFAS impacts in Ash Dam 4, including delineation of elevated PFAS reported at AD401	Investigation locations reported similar ground conditions to previous investigations with discontinuous alternating profiles of ash. Clays, gravelly clays and rock were reported at the base of the ash profile in the majority of locations between 3.4 m (AD409) and 9.7m (AD404) depths, with AD414 and AD415 reporting ash profiles >10 m depth (target depth). Saturated conditions were generally reported at a depth of approximately 4.0 to 4.5 m, however observations in AD409, AD410 and AD408 reported saturated layers at 2.0 m, 3.0 m and 9.0 m depths respectively.	• One or more PFAS compound was reported at or above the laboratory's LOR in AD404 (3.0 m), AD406 (0.5 m and 4.5 m), AD407 (4.0 m), AD410 (2.0 m), AD13 (0.2 m) and AD14 (2.0 m), with all samples below the assessment criteria • All sampling reporting detections of PFAS reported the presence of PFOS, with sample AD404-3.0 reporting detections of PFOS and PFHxA, sample AD405-4.0 reporting detections of PFHxS, PFOS, PFPeA and PFHxA and sample AD414-2.0 reporting detections of PFHxS and PFOS • On the basis that all analytical results were reported below the assessment criteria and previous investigation results additional analytical methods (i.e. TOPA, TOF) were not completed

6.3 AD4 Results Discussion

Review of analytical results for samples collected from AD4 during investigations in June 2022 and May 2023 report detections of PFAS above the laboratory's LOR in 12 of the 43 samples collected. All 12 samples reported detections of PFOS, with samples also reporting detections of PFHxS (6 samples), PFPeA (1 sample) and PFHxA (4 samples).

Comparison of soil investigation results with sediment samples from the adjacent drainage channel indicates that ash and soil materials within AD4 are unlikely to be the source (or sole source) of elevated concentrations observed in sediments. It is noted that whilst sediment samples reported PFBA as the major constituent (and a potentially different PFAS composition when compared to soil samples which reported PFOS as the major constituent, refer **Figure 3**), raised LORs for PFOS were reported in AD4-3 (0.0087 mg/kg) and AD4-4 (0.0036 mg/kg) due to matrix interference, which limit the ability to directly compare results. It is noted that raised LORs were reported in samples with high moisture content (>50%).

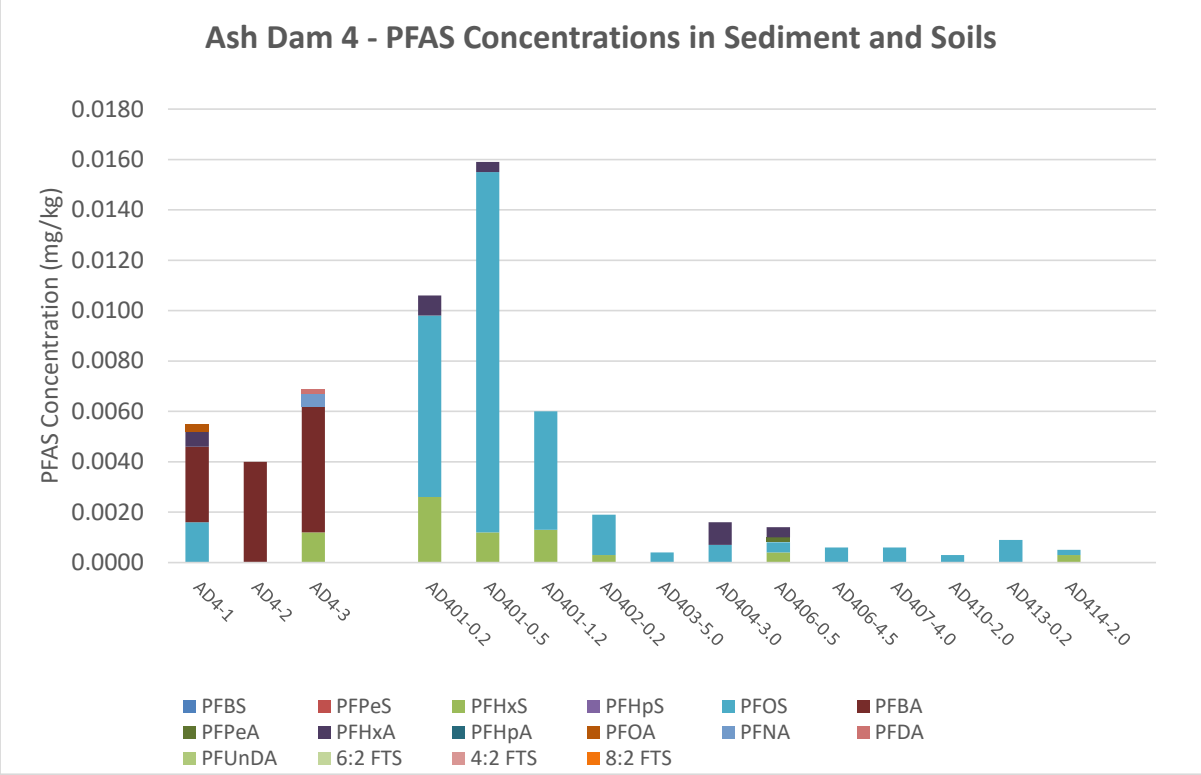

Figure 3. AD4 – PFAS Concentration in Sediments (AD4-1 to AD-3) and Soils (AD401 to AD414)

Results from the current investigation support previous conclusions that in general, ash materials located across the site contain low concentrations of PFAS and are unlikely to comprise a significant source of PFAS. Ash material located within ash disposal areas (including AD4) are considered to contain low concentrations of PFAS consistent with current and historical operational practices which have included the use of site generated water to slurry ash for placement within the WCF, with the results indicating that PFAS impacts are limited and localised (i.e. results from AD401).

7 CALLIDE A (DATA GAPS 2 AND 3)

Previous investigations completed at Callide A reported concentrations of PFAS above the laboratory's LOR at three of the 18 investigation locations, with borehole CA15, located within the Northern Stormwater Pond (NSP) reporting concentrations of PFOS (0.0552 mg/kg) above the ecological indirect criteria, and Sum of PFOS and PFHxS (0.0624 mg/kg) above the HIL-A criteria, but below the HIL-D criteria.

Additional investigation was undertaken at Callide A in accordance with the addendum SAQP (Epic 2023a, **Appendix L**) to determine the nature and extent of potential impacts associated with the northern stormwater pond and confirm potential linkages with surface water discharges to Dunn Creek.

A summary of the identified data gap and background information associated with the Callide A investigation is presented in **Table 17**.

Table 17. Callide A (Data Gap 2 and 3) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	**Data Gap 2:** Soil investigations completed at Callide A indicate a localised PFAS impact may be present within the catchment of the Northern Stormwater Pond (NSP), with elevated concentrations of PFAS reported in soils (coal ash/dust) within the NSP along with surface water. Further investigation will be required to determine the nature and extent of potential impacts at the Callide A NSP. **Data Gap 3:** PFAS is reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations, noting limited water is released via R2 and PFAS impacts were also reported in upstream surface water within Dunn Creek (downgradient of the Callide Mine). No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A, with PFAS reported at R2 likely associated with soil impacts identified at the NSP. Further investigation will be required to confirm the source of PFAS reported within R2.
Initial CLID Recommendation (Epic, 2022c)	Further investigation should be undertaken at Callide A to determine the nature and extent of PFAS impacts identified in the NSP and confirm potential linkages with surface water discharges to Dunn Creek. Results of the investigation should be used to inform any remediation, mitigation or management measures to be implemented to prevent or minimise releases of PFAS from the Callide A site.
Background and History	Callide A Power Station is located in the north-eastern portion of the site and is located on a small ridgeline that borders Dunn Creek. Ash disposal areas (Ash Dams 1 and 2) are located to the south-west and north-east respectively of the main structure.

Previous Investigation	Soil sampling completed at Callide A as part of the initial CLID (Epic, 2022c) indicated a localised PFAS impact may be present within the catchment of the NSP, with elevated concentrations of PFAS reported in soils (coal ash/dust) within the NSP along with surface water. These results included:
	• No PFAS was identified in ash (soil samples) within Ash Dam 2 or the majority of soil samples collected at Callide A with the exception of CA04, CA10 and CA15
	• PFAS concentrations were above the laboratory's LOR at three locations, CA04 (former pump house), CA10 (laydown area) and CA15 (NSP). A summary of the results includes:
	  • Results from CA04 (pump house) reported concentrations of PFOS at the LOR of 0.0002 mg/kg at the surface, with all other compounds reported below the laboratory's LOR, and no PFAS detected in deeper samples. Surrounding samples (CA02, CA05 and CA06) also reported concentrations of PFAS below the laboratory's LOR indicating PFAS detected at CA04 is unlikely to represent a significant source of PFAS.
	  • Results from CA10 (Oxyfuel laydown area) reported detections of PFHxA, PFHpA and PFOA, with a total PFAS concentration of 0.0007 mg/kg. Activities completed at the laydown area are unknown, with results indicating minor PFAS impacts may be present. It is noted that surface water sampling completed at the Eastern Stormwater Pond (**Figure 4** and **Figure 5**) (downstream of CA10) reports concentrations of Perfluoroalkyl Carboxylic Acids (PCAs) including PFHxA, PFHpA and PFOA above the laboratory's LOR, along with PFOS and PFHxS.

	• Borehole CA15 was drilled within the NSP, with site observations reporting layers of coal ash/dust approximately 1.0 m deep and assumed to comprise runoff from the adjacent coal stockpile and coal hopper. The 0.5 m sample reported concentrations of PFOS (0.0552 mg/kg) above the ecological indirect criteria and Sum of PFOS and PFHxS (0.0624 mg/kg) above the HIL-A criteria but below the HIL-D criteria. Site history information (Epic, 2022c) indicates AFFF usage at Callide A was likely to be limited to use of portable foam-type extinguishers (blue band) and/or use of fire control on the coal stockpile, with results indicating localised PFAS impacts may be present within the catchment of the NSP. • Surface water concentrations of PFAS were reported to be present in Dunn Creek, with results indicating that discharges from the Callide A site (via release point R2) are likely to be contributing to PFAS concentrations. A summary of the results included: • Concentrations of PFAS have been reported in all sample locations within Dunn Creek (SW18, SW17 and SW43), with highest concentrations reported in the upstream sample (SW18) (refer **Figure 5**). Most samples collected within Dunn Creek reported concentrations of PFOS above the 95% species protection limit and concentrations of Sum of PFOS and PFHxS above the drinking water criteria. Concentrations are generally reported to decrease along the alignment of Dunn Creek, with concentrations of total PFAS in upstream surface water (SW18) reported between 0.225 – 0.244 µg/L and downstream surface water (SW42) reporting concentrations between <0.0031 – 0.1250 µg/L. • PFAS concentrations within Callide Dam at the mouth of Dunn Creek (SW36) have been reported below the laboratory's LOR during each of the five monitoring events completed. However, it is also noted that LORs have been raised in all samples (PFOS LOR of <0.0008 - <0.00016 µg/L). • PFAS has been reported within the Northern (SW44, total PFAS 0.0054 – 0.0561 µg/L) and Eastern (SW43, total PFAS 0.003 – 0.0192 µg/L) Stormwater Ponds, along with the Callide A release point (R2) into Dunn Creek (total PFAS <0.0032 – 0.202 µg/L). Concentrations of PFAS at R2 were reported to be variable, however concentrations were lower than those observed downstream in Dunn Creek SW17 when sampling was completed at both locations (Dec21 and Jan22, refer **Figure 5**). • No clear trend is observed with PFAS compositions (**Figure 4**), however some similarities are observed across events (i.e. SW18, SW17, SW42 and R2 during the December 2021 monitoring event). It is noted that SW44 and R2 were the only locations to report detection of 6:2 FTS (both at 0.002 µg/L, Oct21) which may indicate some linkage between these locations. • Surface water has also been noted to accumulate within the voids associated with the coal reclaim hopper which may represent a subsurface migration pathway for impacted waters (if any) • Groundwater bores installed surrounding Callide A have not reported a sufficient standing water level to facilitate sampling. As such, no data is available regarding the PFAS concentrations in groundwater (if any). It was recommended that additional investigation be done to determine the nature and extent of potential impacts at the Callide A NSP.

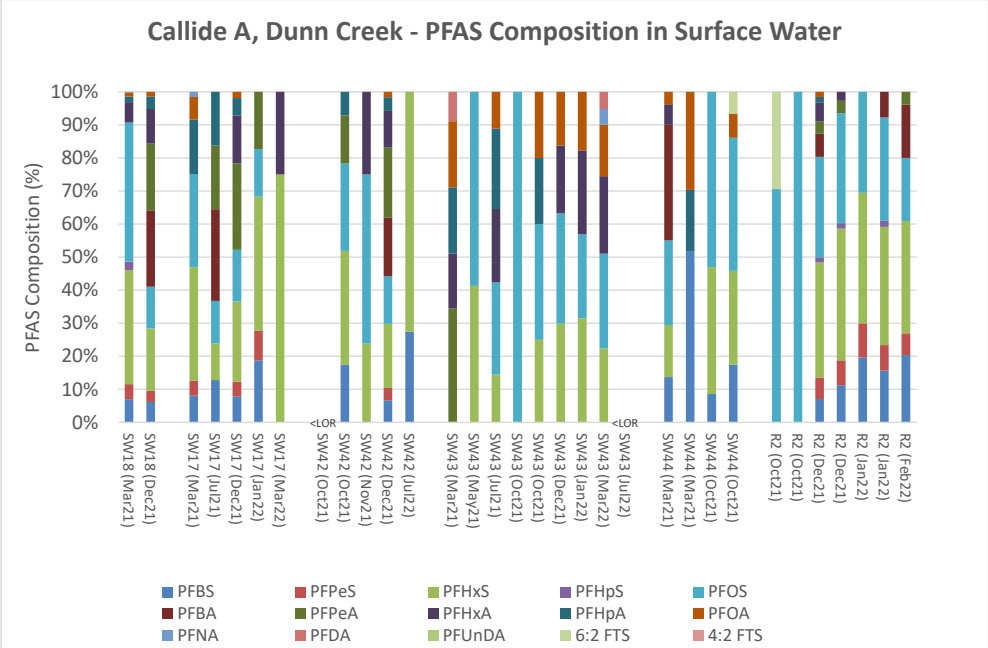

Figure 4. Callide A and Dunn Creek – PFAS Composition in Surface Water (Epic, 2022c)

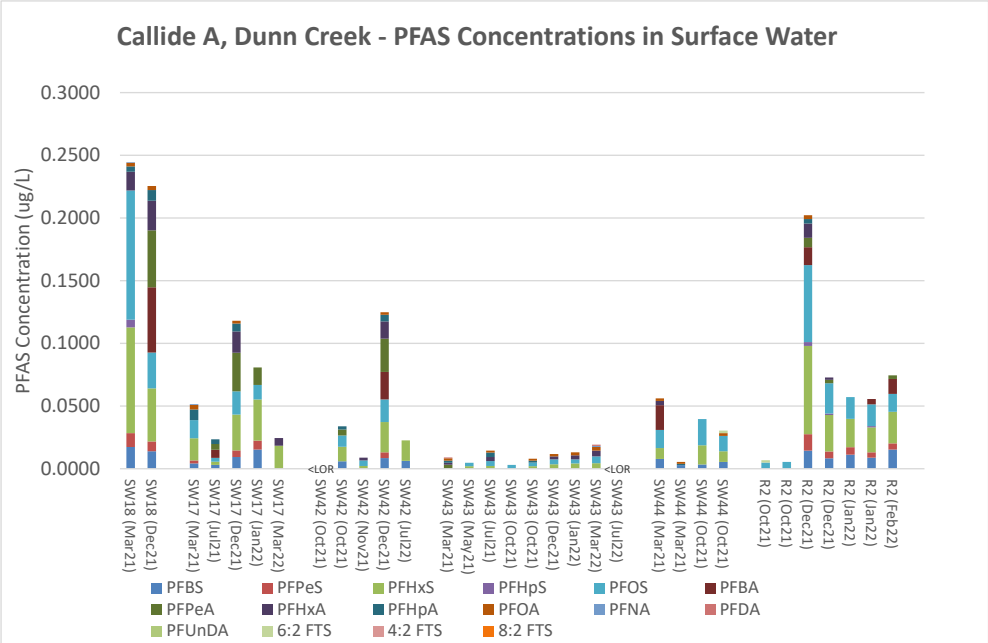

Figure 5. Callide A and Dunn Creek – PFAS Concentration in Surface Water (Epic, 2022c)

Historical Aerial Photograph Review	A review of historical aerials was completed of the catchment associated with the NSP. A summary of this review is presented below, with the complete historical aerial photograph review provided in the Addendum SAQP (Epic, 2023a) (**Appendix L**). The NSP was not visible in photographs prior to 1999, where the area was used for the stockpiling of coal. From this review, areas of interest were identified (2012) in the north-western corner of the site and stormwater channel linking the areas surrounding the ash hoppers with the NSP where white material was visibly being washed into the NSP, potentially mobilising impacted material from a historic discharge of a firefighting foam extinguisher into the pond. Additionally, areas of permanent moisture were identifiable in the northern area of Ash Dam 2 (deep rooted vegetation), which may be the result of infiltration from the NSP or spillway discharge from the NSP. These waters would then eventually discharge into R2 through seepage recovery in the ash dam walls, further corroborated with the findings of GHD (2022).
Ash Dam 2 Preliminary Dam Safety Review (GHD 2022)	GHD completed a preliminary dam safety review and environmental review for Ash Dam 2, with findings documented in a technical memorandum dated 6 September 2022. Key findings from the memorandum include: • Surface water at Callide A is directed to the northern and eastern stormwater ponds. During high rainfall events, water discharges from the ponds through an overflow structure to the wetland area of Ash Dam 2 • The wetland portion of Ash Dam 2 was reported to generally be dry, with MW19 located within the ash profile also generally reported to be dry • A possible preferential flow path through Ash Dam 2 may exist for surface water adjacent to the NSP (possibly from modification to the landform following establishment of the pond) as indicated by a stand of *melaleucas* trees (refer **Figure F5**) • CCTV inspection of the decant outlet pipe (connecting the wetland decant tower and R2) indicated some evidence of minor cracks and minor seepage, with two PVC pipes located at the base of the decant tower inferred to be the upstream ash filter drain pipes • Water flows and discharge from R2 appear to be occasional and likely to have a minimal impact on the receiving environment

7.1 Callide A Investigation Scope

Additional investigations were undertaken in accordance with the Addendum SAQP (Epic, 2023a) (**Appendix L**) and the methodology outlined in **Section 5** to identify and delineate potential secondary sources (if any) present within the NSP at Callide A, and to identify the data gap present in the understanding of potential connectivity of groundwater within Ash Dam 2. The investigation was completed from 31 May to 2 June 2023, with details on the sampling locations provided in **Table 18** and on **Figure F5**.

Table 18. Callide A Additional Investigation Scope

Investigation Area/Target	Identified Risk/Target	Sample Details
NSP	Delineate the extent of PFAS detected during the initial investigation and assess potential migration pathways	• Three soil boreholes (CA17, CA18, CA19) were advanced in the NSP area using primarily push tube methodology, with holes terminated at refusal (CA17 at 1.4 m, CA18 at 1.8 m and CA19 at 1.3 m) and soil samples collected throughout. • CA19 was drilled with a combination of push tube (0.0 – 0.6 m) and solid flight auger (0.6 – 1.3 m) methodology
	Drainage channel identified from historical aerial imagery review (2012) to be flowing towards the NSP	• Four surface soil samples (SS01 – SS04) were collected from within the drainage channel identified within the historical aerial imagery review (2012)
NSP/ R2	Installation of groundwater bores to investigate potential seepage pathways between the NSP and R2	• Seven soil boreholes (MW95#1, MW95#2, MW96#1, MW96#2, MW96#3, MW97, MW97#2) were advanced, targeting the eastern boundary of the NSP, and the permanent vegetation in the

Investigation Area/Target	Identified Risk/Target	Sample Details
		northern portion of Ash Dam 2 and between Ash Dam 2 and Dunn Creek • Multiple boreholes were advanced at each location due to encountering refusal at several locations • Groundwater bores were installed in MW96#3 and MW97 to 6.0 mbgl and 3.3 mbgl, respectively, with MW96#3 observed to be dry at 6.0 m depth • MW97 has been incorporated into the quarterly monitoring events • A groundwater bore was not installed at MW95 due to refusal before water strike
Coal Reclaim Hopper	Potential for PFAS contamination in water collected within the coal hoppers	• One water sample was collected from within the coal reclaim hoppers via the access stairs

7.1.1 Deviations from the Addendum SAQP

Soil boreholes were advanced by a utility-mounted drill rig utilising a combination of pushtube and solid flight auger methodologies. MW96 was installed to 6.0 m and MW97 to 3.3 m. PVC casing and factory-slotted screen were used to construct the monitoring wells, installed with gravel pack to a minimum of 1.0 m above the top of screen, a minimum 0.5m bentonite plug and grout to finish.

MW95 was not installed due to ground conditions encountered (shallow refusal and no water strike), and MW96 was installed dry at the target depth of 6.0 mbgl, noting that the base of the well is likely to be within the wall of AD2 (based on the proximity to the dam wall and stratigraphy encountered). A summary of investigation bores and monitoring wells installed is presented in **Table 19**.

Table 19. Callide A Ash Dam 2 Groundwater Bore Summary

Target Location	Bores Drilled	Depth (mbgl)	Water Strike?	Monitoring Well Installed?	Screened Geology	Stabilised Water Level (mbgl)
MW95	MW95#1	5.5 m (refusal)	No	No		
	MW95#2	3.0 m (refusal)	No	No		
MW96	MW96#1	3.0 m (refusal)	No	No		
	MW96#2	4.2 m (refusal)	No	No		
	MW96#3	6.0 m (target depth)	No	Yes (Screened 3.8 – 5.8 mbgl)	Gravelly Sandy Clay	Dry (14.06.23) Dry (09.12.23)
MW97	MW97	3.3 m (refusal)	Yes (2.8 mbgl)	Yes (Screened 1.8 – 3.3 mbgl)	Gravelly Clay/Clay	2.04 (17.06.23) 2.83 (08.09.23) Dry (09.12.23)
	MW97#2	1.8 m (refusal)	No	No		

Note: mbgl – meters below ground level

A water sample was collected from the coal reclaim hopper via the access stairs. Water was collected directly into laboratory supplied sample bottles (by hand via the access stairs), with the bottles sealed immediately upon collection of the sample.

Sampling from release point R2 was completed by CS Energy's environmental team on 1 and 16 December 2022 and 5, 11 and 18 January 2023 following a number of rainfall events. Samples were collected from within the concrete structure located at R2 (refer **Plate P17**) in general accordance with the methodology detailed in **Section 5.3**. Analytical results are tabulated in **Table T2** and **Table T3**.

7.1.2 Field QA/QC

Duplicate sample pairs were collected and analysed at a rate of one in every 10 primary samples as part of the wider investigation scope in accordance with the PFAS NEMP (refer **Section 4**), with one duplicate pair collected for a total of 21 primary samples (17 from bores and four surface samples) collected during additional investigations at Callide A. Due to the requirement for re-drilling each of the proposed groundwater monitoring bore locations, additional primary samples were collected, however, additional duplicate samples were not collected to meet the increased requirement.

It is noted that although duplicate sampling was not completed at the required rate for the current investigation, a total of five sets of duplicate pairs have been collected for a total of 45 primary samples collected from Callide A across all investigations. Further discussion of field duplicates is presented in **Appendix F.**

7.2 Observations and Analytical Results

Soil analytical results are presented in **Table T5**, with a summary of results presented in **Table 20**. Further discussion on investigation findings is presented in **Section 7.3**. Historical investigation results from Callide A are presented in **Table T1**, **Table T2** and **Table T3** (surface water), **Table T4** (sediment), **Table T5** (soil) and **Table T6** (leachate).

Table 20. Callide A Investigation Results Summary

Investigation Scope	Identified Risk/Target	Observations	Analytical Results
Initial CLID Soil Investigation (June 2022)	Assessment of potential PFAS impacts at former operational areas and ash disposal locations at Callide A	Soils surrounding the Callide A Power Station were typically a shallow reworked fill profile of dark brown clayey sand and light brown clays from 0.05m to 3.2 m in depth. Refusal on rock was encountered at all locations surrounding Callide A Power Station The NSP (CA15) encountered alternating layers of carbonaceous clay and clayey ash to 0.9 m, overlying reworked dark brown gravelly clays. Refusal on rock was encountered at 1.2m Ash Dam 1 comprised of a brown sandy clay cap 0.1 m to 0.2 m deep overlying an alternating pumped, lean phase and bottom ash layers to between 2.6 m (AD1-1) and 5.8 m (AD1-2), overlying dark brown sandy clays. Refusal on rock was encountered at both AD1-1 (2.9m) and AD1-2 (8.8m)	• All samples collected from Ash Dam 1 and Ash Dam 2 reported concentrations of PFAS below the laboratory's LOR. • PFAS was detected at three of the sixteen sampling locations at Callide A, CA04 (former pump house), CA10 (laydown area) and CA15 (NSP). • Results from CA04 (pump house) reported concentrations of PFOS at the LOR of 0.0002 mg/kg at the surface, with all other compounds reported below the laboratory's LOR. • Results from CA10 (laydown area) reported detections of PFHxA, PFHpA and PFOA, with a total PFAS concentration of 0.0007 mg/kg. • Results from CA15 reported concentrations of PFOS (0.0552 mg/kg) above the ecological indirect criteria and Sum of PFOS and PFHxS (0.0624 mg/kg) above the HIL-A criteria at 0.5 m depth but below the HIL-D criteria. PFOS was also reported at 0.0 m and 1.0 m depth, with results below the assessment criteria **TOPA Analytical Results** TOPA analysis was completed on samples for borehole CA15, with all samples reporting higher concentrations in post-TOPA samples. Comparison of TOPA and standard analytical results (**Table T9**) reported percentage increases of total PFAS between 18% (CA15-0.0) and 100% (CA15-0.5). On this basis, it is considered that an additional mass of PFAS precursors may be present in soils at CA15. **TOF Analytical Results** All samples reported concentrations below the laboratory's LOR of 1.0 mg/kg, however the LOR for TOF analysis exceeded the highest total PFAS concentration reported (0.0655 mg/kg [standard analysis]/0.1000 mg/kg [TOPA]).

Investigation Scope	Identified Risk/Target	Observations	Analytical Results
			Soil Leachability • Concentrations of PFHxS and PFOS were reported to be leachable in sample CA15-0.5, with leachable concentrations reported at 20% and 16% of the total concentration respectively (refer **Table T7**). • No other PFAS compounds were reported to be leachable from the samples analysed, noting that LORs were raised for a number of samples (0.016 to 0.080 µg/L).
Addendum EE Soil Investigation (May 2023)	Targeted assessment to delineate PFAS impacts identified during the original investigation and to investigate potential seepage pathways	Boreholes drilled within the NSP (CA17 to CA19) reported coal fines between 0.4 to 0.7 m depth overlying sandy and gravelly clays (possibly reworked natural) grading to rock between 1.3 to 1.8 m depth. The two bores drilled at the proposed location of MW95 reported a shallow discontinuous layer of coal fines, with a layer of ash observed in the northernmost location (MW95#1) between 2.0 and 3.6 mbgl. The southernmost location (MW95#2) reported clay soils between 0.4 to 3.0 mbgl where refusal was encountered. Due to the observed ground conditions, MW95 was not installed. Three bores were drilled in accessible areas surrounding the proposed location of MW96. Bore MW96#1 encountered natural soils and refusal on weathered rock at 3.0 mbgl. Bore MW96#2 reported a layer of ash between 0.6 and 1.0 mbgl, overlying clay soils to a depth of 4.2 m (refusal). Bore MW96#3 reported a similar lithology to bore #2, with the bore terminated at 6.0 m depth, and groundwater monitoring well MW96 constructed. MW97 was installed on the northern side of the AD2 embankment, in an area of potential	• PFAS in soil was detected at six locations sampled within Callide A including 3 boreholes (CA18, MW95, MW96/2) and 3 surface samples (CA-SS01, CA-SS02 and CA-SS04). The 3 boreholes only reported detections of PFOS (0.0002 to 0.0005 mg/kg), with the 3 surface samples reporting detections of PFOS, PFDA, PFUnDA and PFDoDA in at least one of the samples. • All soil investigation results were reported below the adopted assessment criteria and historical maximums reported at Callide A. It is noted that previous investigations at Callide A (soil, sediment and surface water) have not reported detections of PFUnDA and PFDoDA, with PFDA only previously detected in surface water at the Northern (SW44) and Eastern (SW43) Stormwater Ponds. • Water collected from the base of the coal hopper reported detection of PFOS, PFBA and PFOA, with PFBA (0.0311 µg/L) comprising the majority of the total concentration reported (0.0331 µg/L). Concentrations of PFOS (0.001 µg/L) were reported above the 99% Species Protection limit of 0.00023 µg/L. It is noted that a number of compounds were reported at a raised LOR (0.0007 to 0.0016 µg/L). • Groundwater was not encountered in MW96, with the well dry following installation and during inspections completed in June, September and December 2023. A groundwater monitoring well was not installed at the location of MW95 due to shallow refusal • Sampling from MW97 was completed in June and September 2023, with the well reported to be dry in December 2023. Concentrations of PFOS (0.0177 and 0.0205 µg/L respectively) were reported above the 99% Species Protection limit of 0.00023 µg/L, with concentrations of the sum of PFOS and PFHxS (0.0225

Investigation Scope	Identified Risk/Target	Observations	Analytical Results
		seepage (as evidenced by green vegetation). Two bores were attempted, with MW97#1 converted to a groundwater monitoring well. Both locations reported similar lithologies, comprising sandy clays grading to rock and refusal at approximately 3.3 mbgl. Moisture was observed at approximately 2.8 mbgl. Surface samples collected from the drainage channel (SS01 to SS04) consisted of accumulated sediments (sands and gravels) within the drainage channel. The channel was dry at the time of sampling. Sampling at R2 was completed at the v-notch weir after water has flowed through the concrete sump. Since 2023 CS Energy have recovered water from R2 via a vacuum excavator truck to minimise releases from R2.	and 0.0311 µg/L) reported below the Drinking Water Criteria of 0.07 µg/L. Both samples reported raised LORs for a number of compounds, with detections of PFPeS and PFHxS during both events, and PFHpS during the June 2023 event • Sampling of water at release point R2 by CS Energy reported concentrations of PFAS above the laboratory's LOR in all samples, with all samples reporting concentrations of PFOS (0.0115 to 0.0517 µg/L) above the 99% Species Protection limit of 0.00023 µg/L. Samples also generally reported detection of PFBA, PFPeS, PFHxS, PFHpS, PFBA, PFPeA and PFHxA, and were comparable to previous monitoring results from 2021 and 2022.

7.3 Callide A Results Discussion

Additional investigation completed at Callide A did not confirm a specific source area that may be contributing to PFAS impacts reported in the NSP, and release point R2. Review of PFAS results for all samples collected at Callide A indicate concentrations and composition of PFAS at key monitoring locations and across the sample media varies, with no clear correlation between soil investigation results, water samples from the Northern and Eastern Stormwater Ponds and surface water collected from release point R2 (refer **Figure 7**). Variability in PFAS concentrations (refer **Figure 6**) and composition (refer **Figure 7**) was also reported at R2 and the NSP across monitoring events completed between 2021 and 2023.

Previous investigations reported concentrations of PFOS in sediment above the ecological indirect criteria of 0.01 mg/kg at CA15 located within the NSP, with additional investigation locations CA17 to CA19 reporting concentrations generally below the laboratory's LOR and supporting that impacts at CA15 are likely to be localised to the approximately 1.0 m layer of coal ash/dust at this location.

Results from soil investigations support the previous conclusions that Callide A is unlikely to comprise a primary source area, noting that the majority of samples reported concentrations of PFAS below the laboratory's LOR and/or adopted assessment criteria. The differences in PFAS composition at some locations (i.e. soil samples CA04-1.0, CA10-0.0, CA-SS01, CA-SS02 and CA-SS04) may indicate a small number of localised residual PFAS impacts, which may contribute to the variability observed in the NSP and release location R2, combined with localised soil impacts reported within the NSP at borehole CA15. It is noted that the Callide A Power Station was retrofitted to trial low emission coal-fired power generation between 2010 and 2015 (following original decommissioning in 1988), with variability in PFAS concentrations at some locations potentially associated with activities completed during this time.

Comparison of PFAS results for surface water at the NSP (SW44), seepage at R2 and groundwater at MW97 indicate that a potential linkage may exist between surface water and seepage, and surface water/seepage and groundwater, with some similarities between PFAS composition at each location (refer **Figure 7**), however it is noted that no PCA compounds were detected in groundwater at MW97 and a number of PCA compounds reported in the NSP (SW44) were not detected in seepage at R2.

Review of water chemistry between the NSP (SW44), seepage at R2 and groundwater at MW97 (refer piper diagram in **Figure 8**) indicates a potential linkage between seepage at R2 and groundwater at MW97, however surface water at the NSP (SW44) is reported to be distinctly different, which may support that a possible preferential flow path through Ash Dam 2 exists.

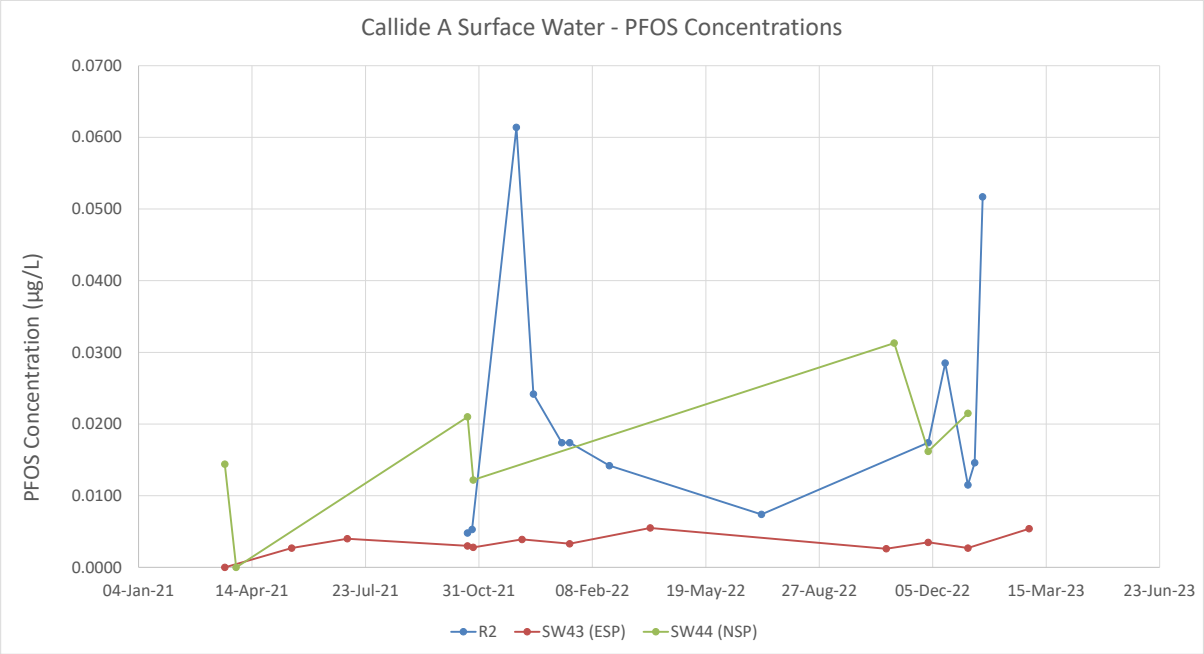

Figure 6. Callide A Surface Water – PFOS Concentrations

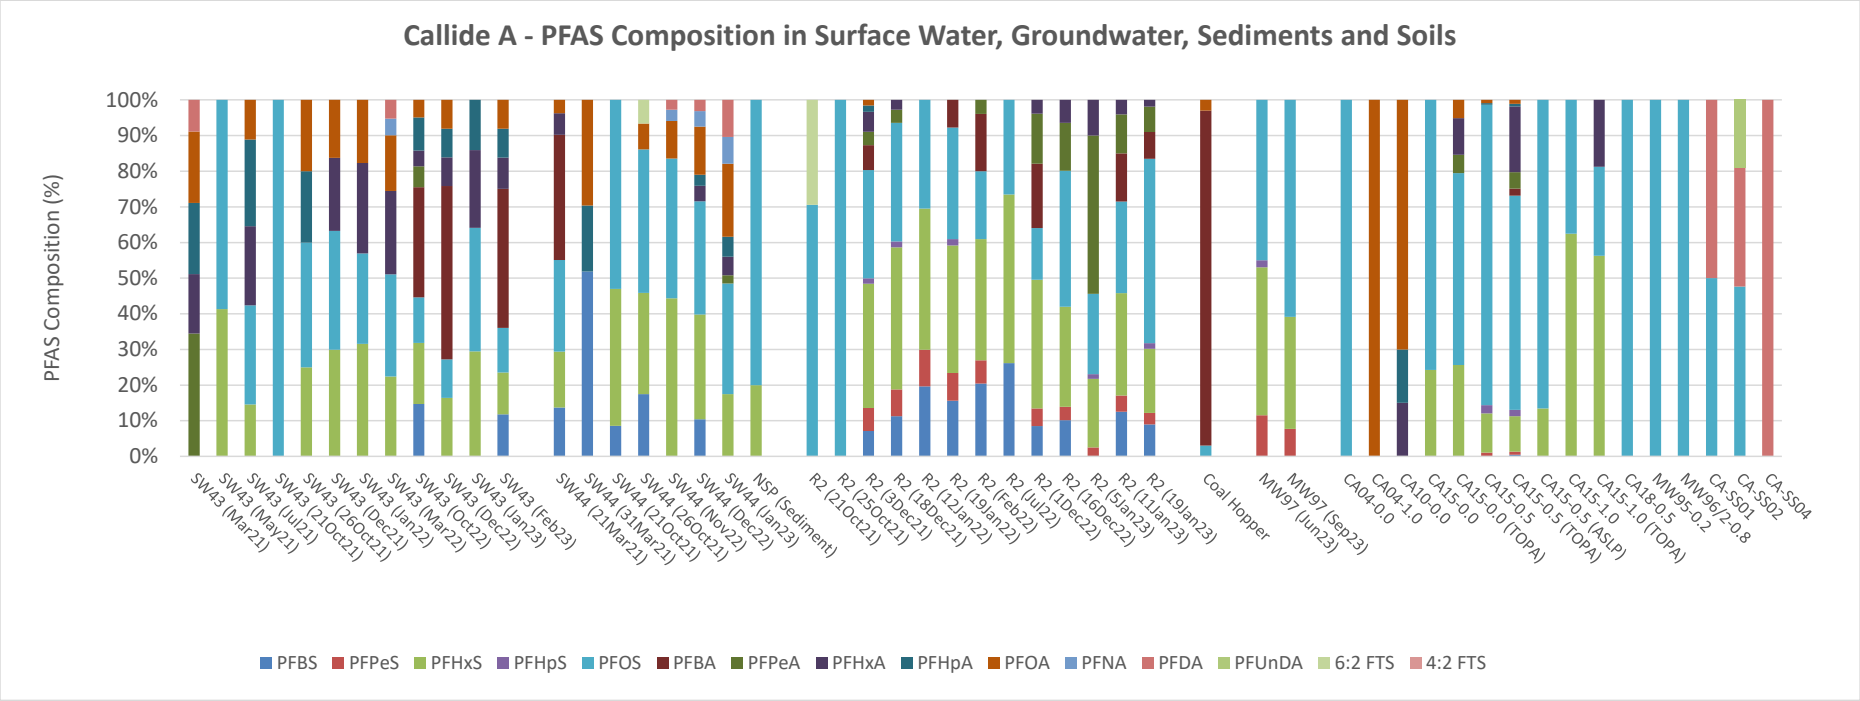

Figure 7. Callide A – PFAS Composition in Surface Water (SW43, SW44, R2, Coal Hopper), Groundwater (MW97), Sediments (NSP) and Soils (CA04, CA10, CA15, CA18, CA-SS01 to SS04)

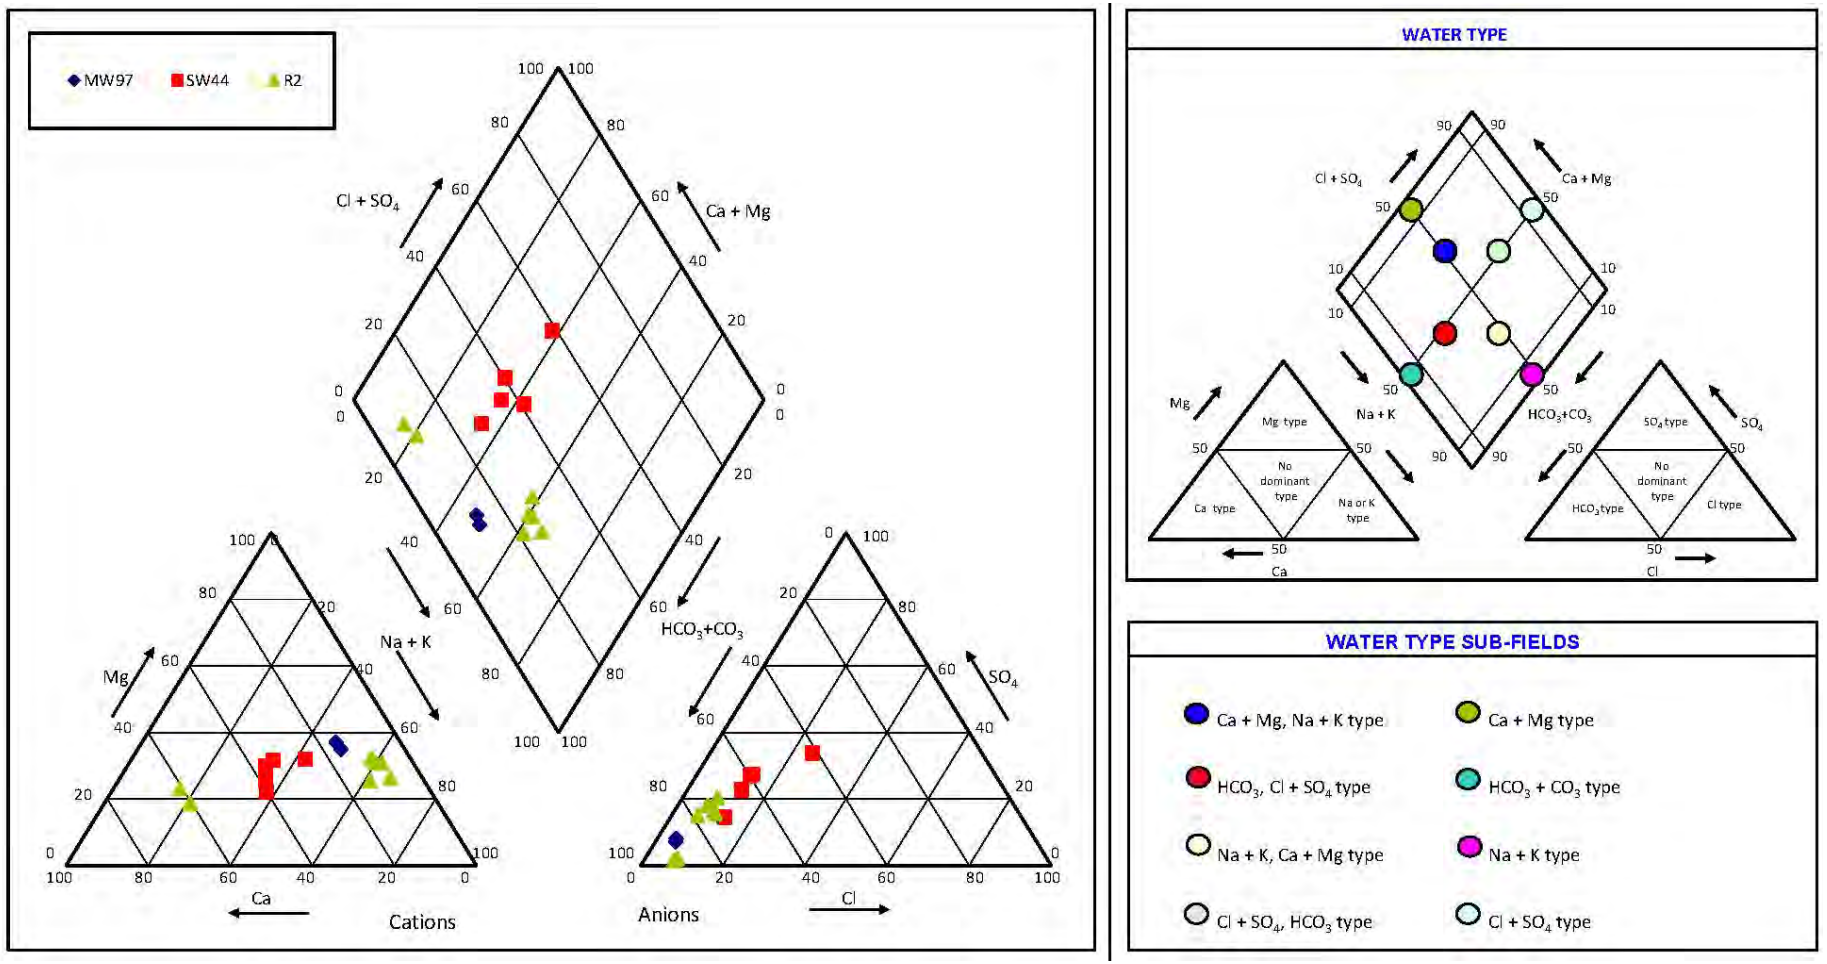

Figure 8. **Callide A – Piper Diagram for Surface Water (SW44, R2) and Groundwater (MW97)**

8 EASTERN SEEPAGE AREAS (DATA GAP 4)

Previous investigation completed in the Eastern Seepage Areas reported significant differences in both concentration and composition between onsite wells (MW11, ESC1, ESC3, ESC4, total PFAS up to 0.859 µg/L) and offsite wells (MW31, MW32, MW33 and MW43, total PFAS up to 9.850 ug/L). As reported in the Initial CLID (Epic, 2022c), it is considered likely that the eastern seepage area comprises at least two seepage pathways, one associated with the current seepage pathway/seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32.

Additional groundwater investigation was undertaken in the Eastern Seepage Area in accordance with the addendum SAQP (Epic 2023a, **Appendix L**) to confirm the nature and extent of seepage pathways at the eastern seepage area.

A summary of the identified data gap and background information associated with the Eastern Seepage Area investigation is presented in **Table 21**.

Table 21. Eastern Seepage Areas (Data Gap 4) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	Groundwater results indicate that the eastern seepage area likely comprises at least two seepage pathways, one associated with the current seepage pathway and seepage recovery system, and an additional longer pathway associated with fractured rock which includes monitoring well MW32. Further investigation will be required to confirm the nature and extent of seepage pathways at the eastern seepage area.
Initial CLID Recommendation (Epic, 2022c)	Further investigation of existing seepage pathways (eastern, southern and western) should be undertaken to confirm the extent of current seepage pathways, identify any additional pathways and confirm linkages with the receiving environment. In particular, further investigation is required to determine the nature and extent of the secondary seepage pathway identified at the eastern seepage area, as represented by MW32. Results of the investigation should be used to inform refinement of the existing seepage recovery systems and/or implementation of additional measures to minimise or prevent seepage releases from the site. It is noted that at the time of reporting, CS Energy had engaged a geophysicist to undertake a dipole-dipole resistivity survey of the current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites.
Background and History	Shallow seepage has been reported along the southern boundary of Ash Dam B, with seepage intercepted by the eastern seepage collection trench, with a network of seepage recovery bores (ESC5, ESC6, MW52 and MW61) installed to intercept deeper seepage and return it to Ash Dam B. Highest rates of seepage are observed in the eastern seepage recovery area, with approximately 77% of total seepage recovered during 2020 reported to be from the eastern seepage recovery area (EMS 2022). Current seepage recovery data indicates that >70% of seepage from Ash Dam B is recovered and returned to Ash Dam B via the current seepage recovery schemes (Epic, 2022c). A longer groundwater seepage pathway has also been identified southeast of the eastern seepage recovery area, with the inferred pathway connecting the area of ADB spillway with monitoring wells MW32 and MW43 and ultimately Callide Creek. PFAS travel times from MW32 to MW43, and MW43 to Callide Creek along the inferred seepage flowline as unattenuated solutes are estimated at 4.5 and 6.3 years respectively.
Previous Investigation	Groundwater results for the eastern seepage area report significant differences in PFAS composition between onsite wells (MW11, ESC1, ESC3, ESC4) and offsite wells (MW31, MW32, MW33 and MW43) as shown by **Figure 9** and **Figure 10**. Onsite wells reported total PFAS concentrations up to 0.8590 µg/L (ESC4), with PFAS generally composed of Perfluoroalkyl Sulfonic Acid (PSA) compounds. Offsite wells reporting concentrations up to 9.8500 µg/L (MW32), with PFAS composed of PSAs, PCSAs and FTS compounds. Highest concentrations were reported offsite in MW32, with concentrations observed to decrease to the east (MW33), south (MW31) and southwest (MW43). Concentrations of PFAS within MW32

have remained stable across all monitoring events (Figure 12). MW32 and MW31 are reported to be installed in proximity to an inferred geological fault line (refer **Figure F6**).

Groundwater bore ESC3 is located centrally within the seepage recovery area, with current recovery wells comprising ESC5, ESC6, MW52 and MW61. Composition of PFAS has shown some variance within ESC3 over time (Figure 11), with concentrations reporting a generally increasing trend. Groundwater bore ESC4 is located adjacent to MW52 and likely represents the north-eastern extent of the seepage capture area while MW43 likely represented the south-eastern extent. ESC4 shows a similar PFAS composition to MW32 during the April 2022 monitoring event, with MW43 showing a similar PFAS composition to MW32 during all monitoring events, indicating that some impacted groundwater (as represented by MW32) may be being recovered by the current seepage recovery system. It is likely that the eastern seepage area comprises at least two seepage pathways, one associated with the previously identified pathway and seepage recovery system, and an additional longer pathway possible associated with fractures potentially influencing MW32.

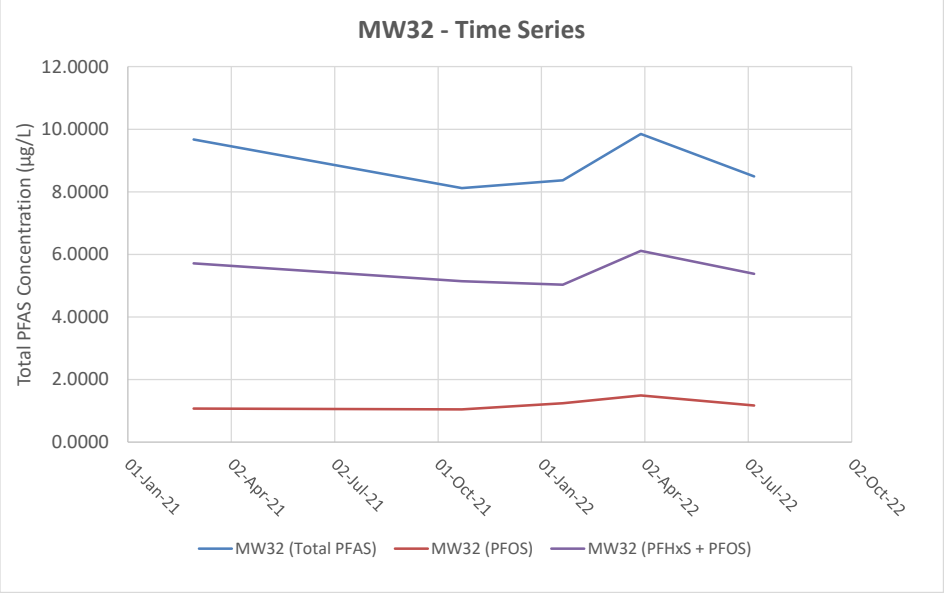

Figure 12. MW32 Time Series Plot (Epic, 2022c)

Geophysical Resistivity Survey	A geophysical resistivity survey has been completed by Fender Geophysics of current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites. The survey was completed using dipole-dipole electrical resistivity imaging (ERI) between 8 and 20 August 2022. The survey identified areas of moisture and potential groundwater at depth within, and surrounding the eastern seepage area, with the report recommending intrusive works to further assess potential seepage areas (where existing monitoring wells are not already established). A copy of the geophysical resistivity survey report is included as **Appendix N**. Based on the findings of the geophysical survey, and in consultation with CS Energy's consultant hydrogeologist, a total of 13 groundwater bores were proposed to be established to further investigate the eastern seepage area and supplement the ongoing groundwater monitoring program.

Groundwater Bore Installation	Of the 13 groundwater bores proposed to be established in the eastern seepage area, nine were completed (MW81 to MW85, MW89 to MW91 and MW94). Groundwater bores MW81, MW82, MW83, MW85 and MW90 were established as 150 mm diameter recovery bores, with the remaining locations comprising 50 mm monitoring wells. Further details on the groundwater bore installation is presented in **Section 13.1**, with a copy of the groundwater bore installation reports included in **Appendix O**.

8.1 Eastern Seepage Areas Investigation Scope

Ongoing groundwater monitoring was completed within the Eastern Seepage Area in accordance with the Addendum SAQP (Epic, 2023a) (**Appendix L**) and the methodology outlined in **Section 5** to provide ongoing assessment of PFAS within key migration pathways. Ongoing monitoring was completed on a quarterly basis with sampling events taking place on 27 Feb – 8 Mar 2023, 6 – 15 Jun 2023, 4 – 9 Sep 2023 and 4 – 14 Dec 2023. Details on the sampling locations are provided in **Table 22.**

Table 22. Eastern Seepage Areas Additional Investigation Scope

Investigation Area/Target	Identified Risk/Target	Sample Details
Eastern Seepage	Potential migration of impacts from Ash Dam B via seepage to the eastern seepage collection area and offsite.	• Quarterly monitoring of MW32, MW42 and MW43 • Seasonal (6-monthly) monitoring of ESC3, ESC4, MW31 and MW33

8.1.1 Deviations from the Addendum SAQP

Monitoring was not completed in accordance with the Addendum SAQP as follows:

- MW33 was not sampled during the Q2 dry season event (June 2023) – incorrectly omitted from Q2 scope
- MW42 was not sampled during the Q1 event (March 2023) – incorrectly omitted from Q1 scope

Following installation and development of additional monitoring and recovery bores (MW81 to MW85, MW89 to MW91 and MW94), bores were included in the Q3 (September) and Q4 wet season (December 2023) quarterly monitoring events.

8.1.2 Field QA/QC

Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples as part of the wider groundwater and surface water investigation scope in accordance with the PFAS NEMP (refer **Section 4**). Further discussion of field duplicates is presented in **Appendix F**.

8.2 Groundwater Analytical Results

Groundwater analytical results are presented in **Table T1**, **Table T2** and **Table T3**, with a summary provided in **Table 23**.

Table 23. Eastern Seepage Area Investigation Results Summary

Investigation Scope	Monitoring Wells	Identified Risk/Target	Analytical Results
Initial EE Groundwater Investigation (2022)	ESC3 ESC4† MW11† MW13† MW30† MW31 MW32 MW43	Potential migration of impacts from Ash Dam B via seepage to the eastern seepage collection area and offsite.	**Onsite Monitoring Wells (ESC1, ESC3, ESC4 and MW11)** • Results for onsite monitoring wells within the eastern seepage area including ESC1 (Nov20 – Jan21), ESC3 (Nov20 – Jul22), ESC4 and MW11 (Apr-Jun22) reported PFOS exceeding the 99% species protection level during all monitoring events, with concentrations of Sum of PFOS and PFHxS exceeding the drinking water criteria in all monitoring events completed after October 2021 (prior to this, concentrations were reported between 0.0551 µg/L and 0.0624 µg/L). • All wells reported detections of PFBS, PFPeS, PFHxS and PFOS, with PFHpS reported in ESC1, ESC3 and ESC4, PFBA and PFHxA reported in ESC1 and ESC4, PFPeA and PFHpA reported in ESC4 and PFNA and 6:2 FTS reported in ESC1 and ESC3. • Total PFAS concentrations were reported between 0.0511 µg/L (ESC1, Nov20) and 0.859 µg/L (ESC4, Apr22). • TOPA analysis was completed on ESC1 and ESC3 in November 2020 which indicated increases in PFAS concentrations following oxidation, however subsequent analysis in January 2021 reported TOPA and standard analytical results to be comparable (**Table T8**), and the presence of additional PFAS precursors is unlikely. • Analysis for TOF was completed on ESC1 and ESC3 in November 2020 and January 2021. Results were reported at (ESC1, Jan21) or below the laboratory's LOR, indicating samples are unlikely to have a high percentage of other fluorinated organic compounds present. **Offsite Monitoring Wells (MW31, MW32, MW33 and MW43)** • Results for offsite monitoring wells adjacent to the eastern seepage area reported PFOS exceeding the 99% species protection level during at least one monitoring event, with MW32 exceeding the 99% and 95% species protection levels during all monitoring events. MW43 reported concentrations of Sum of PFOS and PFHxS exceeding the drinking water criteria during all monitoring events (up to 1.56 µg/L), with MW32 reporting concentrations exceeding the recreational criteria during all monitoring events (up to 6.11 µg/L). • MW32 and MW43 reported detections of PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA, PFOA and 6:2 FTS with total PFAS concentrations up to a maximum of 9.85 µg/L (MW32, Mar22) and 2.80 µg/L (MW43, Oct21). MW31 reporting detections of PFOS, PFPeA, PFHxA and 6:2 FTS, with a total PFAS concentration up to a maximum of 0.0723 µg/L (Oct21). MW33 reporting detections of PFPeS, PFHxS, PFHpS, PFOS, PFPeA, PFHxA and 6:2 FTS with a total PFAS concentration of 0.0642 µg/L (Feb21).

Investigation Scope	Monitoring Wells	Identified Risk/Target	Analytical Results
			• TOPA analysis was completed on MW43 in January 2021 which reported TOPA and standard analytical results to be comparable (**Table T8**), and the presence of additional PFAS precursors is unlikely. • Analysis for TOF was completed on MW43 in January 2021 with results reported below the laboratory's LOR, indicating samples are unlikely to have a high percentage of other fluorinated organic compounds present.
Addendum EE Groundwater Investigation (2023)	ESC3 ESC4 MW31 MW32 MW33 MW42 MW43 MW81 MW82 MW83 MW84 MW85 MW89 MW90 MW91 MW94		• Concentrations of PFOS were reported in all monitoring wells above the 99% Species Protection limit of 0.00023 µg/L for sampling completed during October 2022, March 2023, June 2023, September 2023 and December 2023, with the exception of MW31 in December 2023 (<0.0006 µg/L). Concentrations were reported above the 95% Species Protection limit in MW32 (all samples) and MW43 (October 2022 and March 2023) • Concentrations of the sum of PFOS and PFHxS were reported above the Drinking Water Criteria of 0.07 µg/L in ESC4, MW32 and MW43 (all samples), MW42 (September 2023 and December 2023) and ESC3 (October 2022 and December 2023), with samples from MW32 also reporting concentrations above the Recreational Water criteria of 2.0 µg/L • Highest concentrations were reported in MW32, with total PFAS (10.5 µg/L, December 2023) reported above the historical maximum of 9.85 µg/L (March 2022) • All of the nine new monitoring/recovery bores reported concentrations of PFOS above the 99% Species Protection limit, with concentrations also reported above the 95% Species protection limit in MW84 (all samples), MW85 (September 2023 and December 2023), MW89 (December 2023) and MW91 (September 2023) • With the exception of MW82, all new monitoring/recovery bores reported concentrations of the sum of PFOS and PFHxS above the Drinking Water Criteria, with MW84 (all samples) reporting concentrations above the Recreational Water Criteria • MW84, located onsite and adjacent to the ADB spillway reported the highest concentrations of PFAS, with PFOS, sum of PFOS and PFHxS and total PFAS reported at 12.0 µg/L, 33.5 µg/L and 48.6 µg/L respectively during the September 2023 monitoring event, and representing the highest concentrations of PFAS reported in groundwater at any of the monitoring locations in the program (next highest concentrations reported in MW32)

Notes: [†] Monitoring wells only included in April and July 2022 monitoring events in accordance with the SAQP (Epic 2022a)

8.3 Eastern Seepage Area Results Discussion

Groundwater results for the eastern seepage area support the presence of two seepage pathways, one associated with the current seepage pathway and seepage recovery system (ESC3, ESC4, ESC5, ESC6, MW42, MW52, MW61, MW83 and MW85), and an additional longer pathway associated with fractured rock roughly following a flow path connecting MW84, MW32 and MW43.

Existing monitoring wells reported PFAS concentrations to generally be stable and comparable to historical results. With the exception of MW84, all new groundwater bores reported results that are generally comparable to nearby wells and assist in further understanding the potential extent of known seepage pathways, noting that a number of the monitoring wells are located within the zone of influence of the current seepage recovery network (refer **Section 14.1.1** and approximate seepage recovery zone shown on **Figure F6**).

Groundwater monitoring wells MW84, MW32, MW43 along the main inferred seepage pathway (and MW89 and MW91 adjacent to the main pathway) show similar PFAS signatures (**Figure 13**) with decreasing concentrations from north (MW84) to south (MW43) and east to west. Low concentrations of PFAS are reported in MW33 and MW31 located further east, which is supported by the existing understanding of known seepage influences and seepage from Callide Dam (EMS, 2024), with locations beyond the influence of historical seepage from ADB. This is shown in **Figure 14**. The similarities in PFAS composition, along with elevated concentrations along the MW84 to MW43 alignment, supported the presence of a second seepage pathway.

Some fluctuation is observed in concentrations within groundwater monitoring wells MW89 and MW91 across the three monitoring events, which may be associated with their proximity to the centre of the longer seepage pathway (likely to be located to the west and east of the interpolated centre line respectively), and/or influence from the existing seepage recovery capture zone to the west (refer **Figure F6**).

Although PFAS concentrations in MW84 (total PFAS 36.7 – 48.6 µg/L) are significantly higher than results reported as part of the EE CLID (Epic, 2022c) (MW32 total PFAS 8.12 – 10.50 µg/L), it's not considered to change the current understanding of potential risk associated with the eastern seepage area, with results from existing hydraulically downgradient monitoring wells MW32 and MW43 remaining stable over time. Results report concentrations of PFAS reducing between MW84 and MW32, and then further reducing between MW32 and MW43, as shown in **Figure 14**. Reduction in concentration is likely to continue between MW43 and the discharge point to Callide Creek, noting that in general, concentrations of surface water in Callide Creek (as represented by SW12) are at or below the Drinking Water Criteria.

The nearest known PFAS source area to MW84 (with high PFAS concentrations) is the FOT, located approximately 900 m north. It's noted that MW84 and MW32 are located in close proximity to the location of the inferred geological fault line, which is inferred to continue north towards the FOT. It is noted that perfluoroalkyl sulfonic acid (PSA) compounds comprised the main functional group (~70-80%) in MW84, MW32 and MW43, with PFHxS (~40-50%) the main compound by percent composition. Comparison with soil results from the FOT (refer Figure 45 in the EE CLID (Epic, 2022c)) report a similar proportion of PSA compounds (>70%), however PFOS is generally reported to be the main compound (~70-90%).

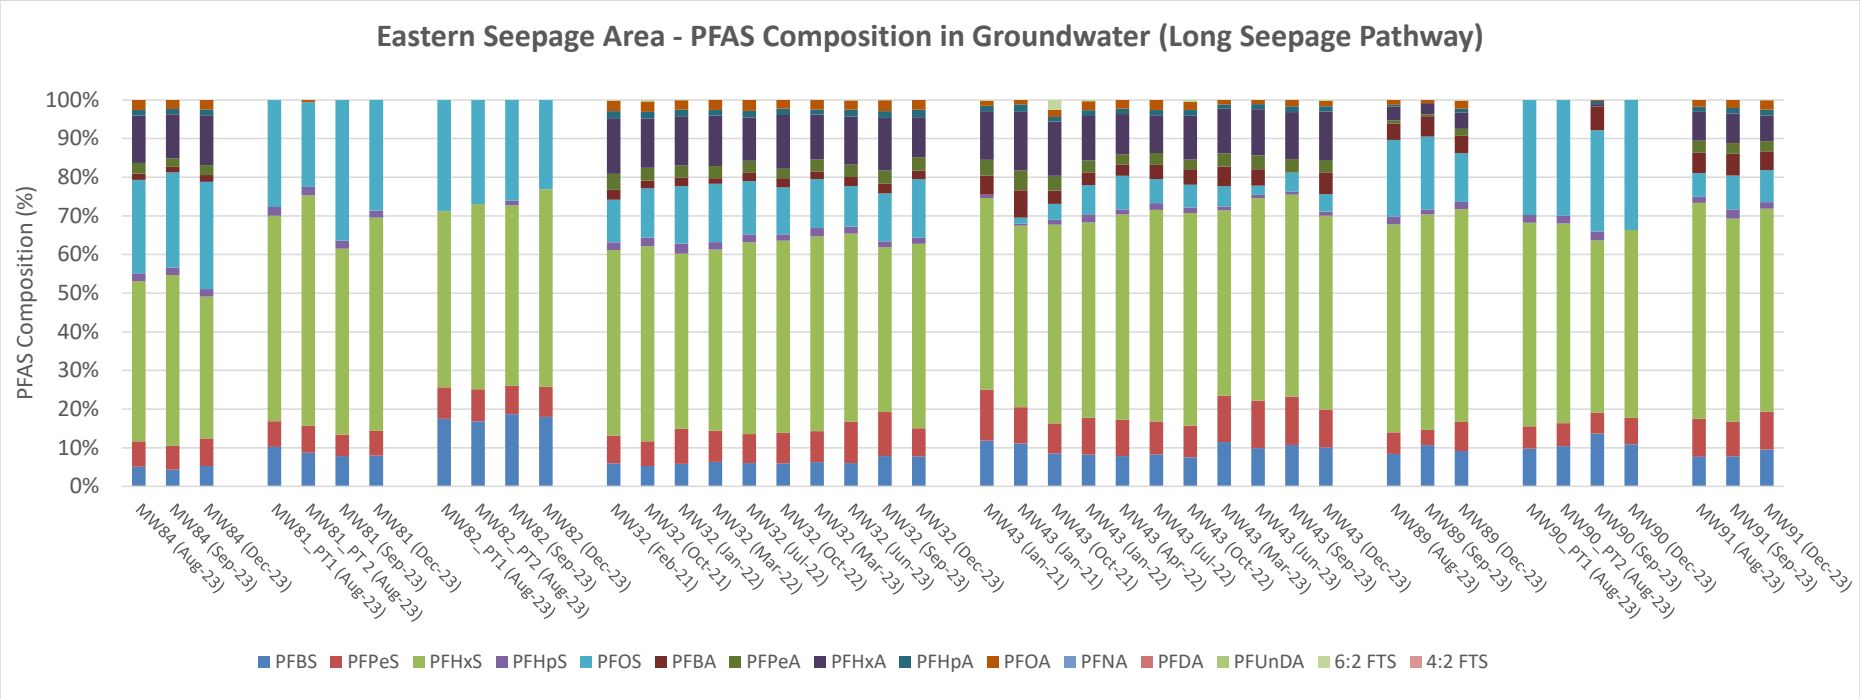

Figure 13. Eastern Seepage Area – PFAS Composition in Groundwater (Long Seepage Pathway)

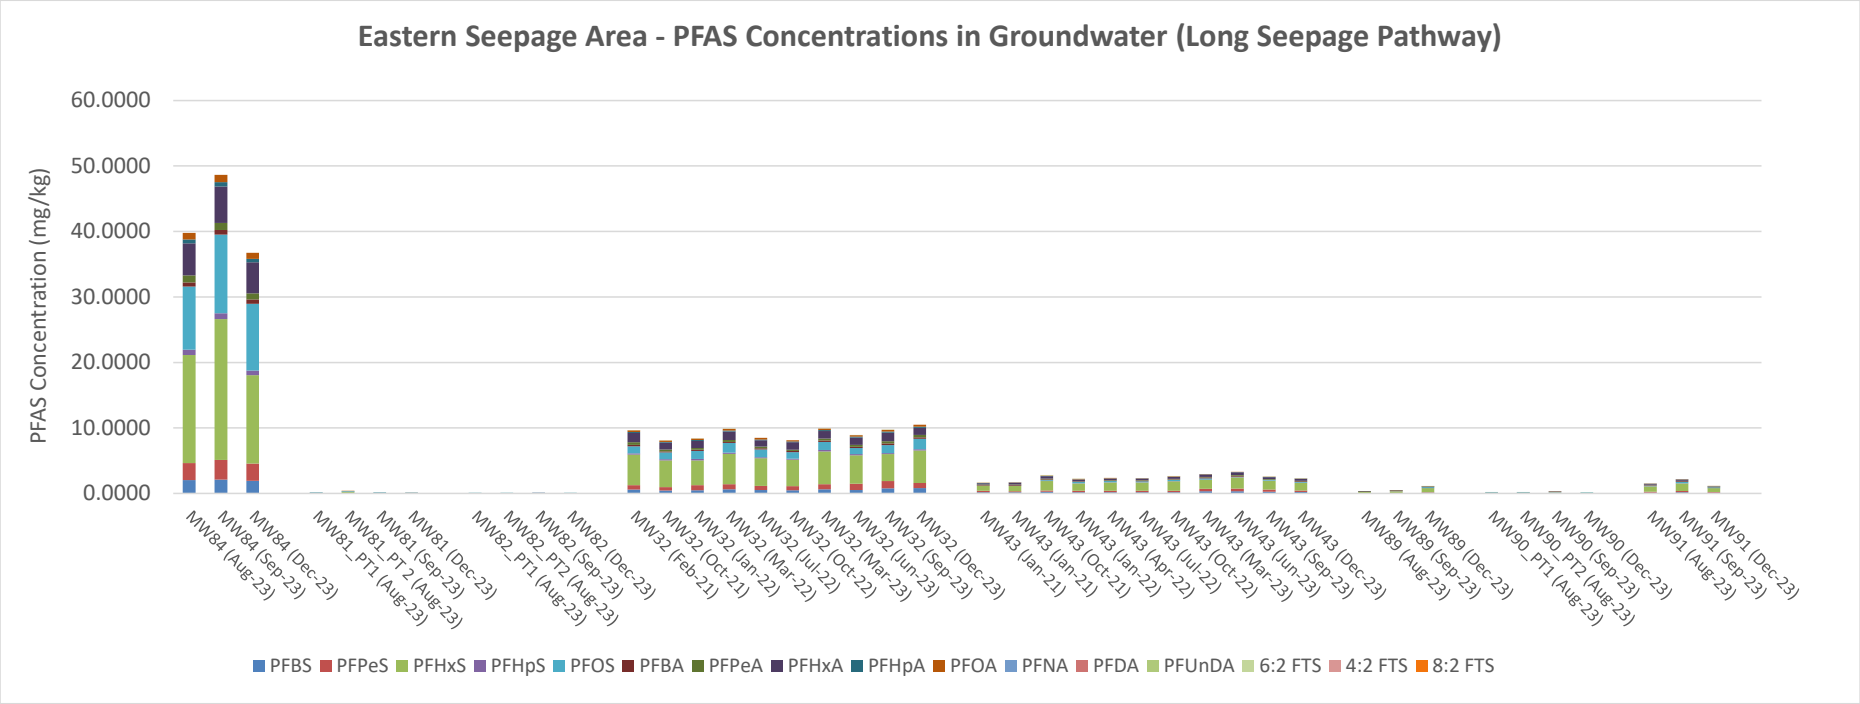

Figure 14. Eastern Seepage Area – PFAS Concentration (Long Seepage Pathway)

9 WESTERN SEEPAGE AREA (DATA GAP 5)

Previous investigations completed in the Western Seepage Areas reported PFAS composition to be comparable across all monitoring wells, with MW49 reporting a greater proportion of PFHxS and highest concentrations (total PFAS up to 4.67 µg/L, approximately one order of magnitude higher than other wells [total PFAS between 0.22 – 1.01 ug/L]). It is considered likely that surface water within the Western Stormwater Diversion Channel infiltrates through shallow alluvial soils in the southern portion of the site, however previous investigation results indicate this is unlikely to be the cause of elevated concentrations within MW49 which may be located outside of the current groundwater seepage capture area.

Additional groundwater investigation was undertaken at the Western Seepage Area in accordance with the addendum SAQP (Epic 2023a, **Appendix L**) to confirm the nature and extent of seepage pathways at the western seepage area.

A summary of the identified data gap and background information associated with the Western Seepage Area investigation is presented in **Table 24**.

Table 24. Western Seepage Area (Data Gap 5) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	Groundwater results from the western seepage area indicate some wells, including MW49, may be outside the current groundwater seepage recovery area. In addition, surface water within the Western Stormwater Diversion Channel (carrying stormwater from the north) may infiltrate through alluvial soils in the south-western portion of the site, potentially contributing to PFAS impacts in groundwater. Further investigation will be required to confirm the nature and extent of seepage pathways at the western seepage area along with potential contribution from surface water infiltration.
Initial CLID Recommendation (Epic, 2022c)	Further investigation of existing seepage pathways (eastern, southern and western) should be undertaken to confirm the extent of current seepage pathways, identify any additional pathways and confirm linkages with the receiving environment. It is noted that at the time of reporting, CS Energy had engaged a geophysicist to undertake a geophysical survey of the current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites.
Background and History	Shallow seepage has been reported along the western and southern boundaries of Ash Dam B, with seepage intercepted by the western seepage collection trench, with a network of seepage recovery bores (MW55 to MW58) installed to intercept deeper seepage and return it to Ash Dam B.
Previous Investigation	Groundwater results from the western seepage area reported PFAS composition to be comparable across all monitoring wells **(Figure 15**), with MW49 reporting a greater proportion of PFHxS (green). MW49 also reported highest PFAS concentrations (**Figure 16**), with remaining locations reporting concentrations approximately one order of magnitude lower. Groundwater monitoring well MW49 is located adjacent to where the Western Stormwater Diversion Channel exits the site. This portion of the site is underlain by the alluvial soils associated with a former creek channel (refer **Figure F7**). The section of the Western Stormwater Diversion Channel near MW49 can also receive overflow from the Western Seepage Collection Pond should it overflow. MW49 is also likely outside of the current groundwater seepage capture area, with current recovery wells comprising MW55, MW56, MW57 and MW58. Surface water flows along the Western Stormwater Diversion Channel may pool within the former creek channel and infiltrate to alluvial soils, however, a comparison of results for MW49 (total PFAS up 4.34 µg/L) to surface water in the Western Seepage Collection Pond (SW03, total PFAS up to 0.486 µg/L) and the Western Stormwater Diversion Channel (SW35, total PFAS up to 0.443 µg/L) indicate that current surface water flows are unlikely to be the cause of high PFAS concentrations reported in MW49.

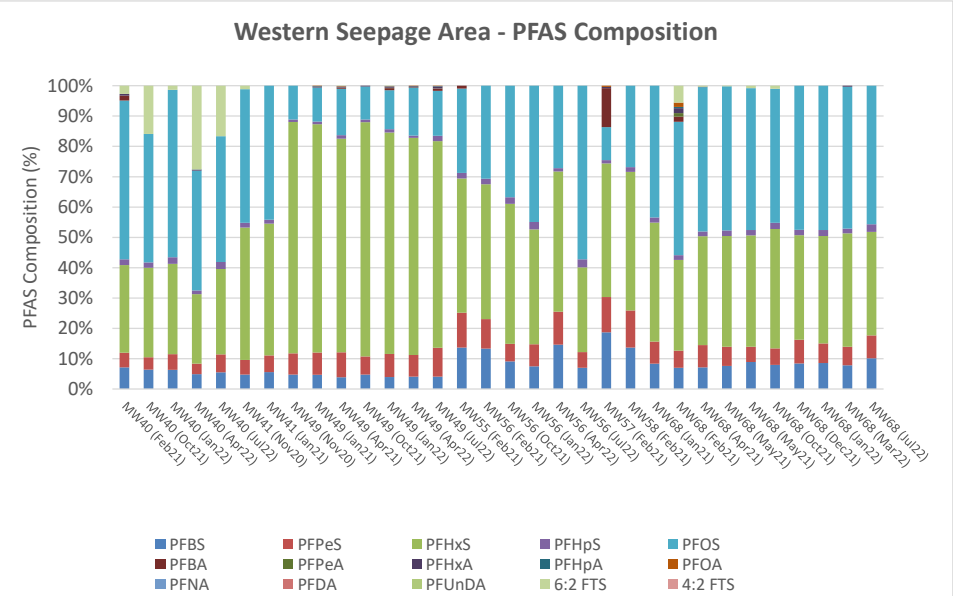

Figure 15. Western Seepage Area – PFAS Composition in Groundwater (Epic, 2022c)

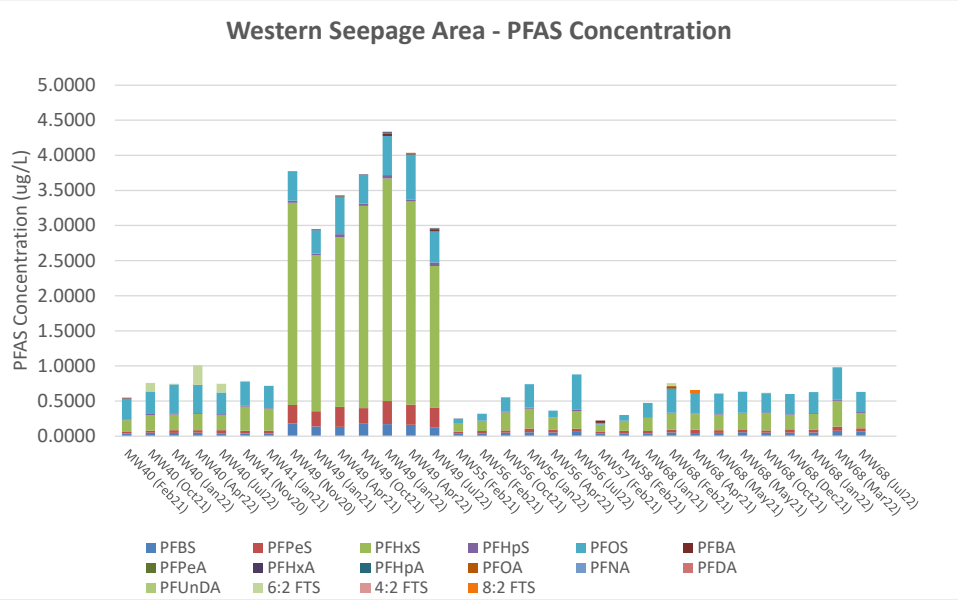

Figure 16. Western Seepage Area – PFAS Concentration in Groundwater (Epic, 2022c)

Geophysical Resistivity Survey	A geophysical resistivity survey has been completed by Fender Geophysics of current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites. The survey was completed using dipole-dipole electrical resistivity imaging (ERI) between 8 and 20 August 2022. The survey identified areas of moisture and potential groundwater at depth within, and surrounding the eastern seepage area, with the report recommending intrusive works to further assess potential seepage areas (where existing monitoring wells are not already established). A copy of the geophysical resistivity survey report is included as **Appendix N**. Based on the findings of the geophysical survey, and in consultation with CS Energy's consultant hydrogeologist, one groundwater bore was proposed to be established east of the current western seepage area to supplement the ongoing groundwater monitoring program.
Groundwater Bore Installation	One groundwater monitoring bore (MW98) was completed east of the western seepage area, with an additional bore (MW86) installed between the western and southern seepage areas, however the bore is reported to be dry. Further details on the groundwater bore installation is

	presented in **Section 13.1**, with a copy of the groundwater bore installation reports included in **Appendix O**.

9.1 Western Seepage Areas Investigation Scope

Ongoing groundwater monitoring was completed within the Western Seepage Area in accordance with the Addendum SAQP (Epic, 2023a) (**Appendix L**) and the methodology outlined in **Section 5** to provide ongoing assessment of PFAS within key migration pathways. Ongoing monitoring was completed on a quarterly basis with sampling events taking place on 27 Feb – 8 Mar 2023, 6 – 15 Jun 2023, 4 – 9 Sep 2023 and 4 – 14 Dec 2023. Details on the sampling locations are provided in **Table 25.**

Table 25. Western Seepage Areas Additional Investigation Scope

Investigation Area/Target	Identified Risk/Target	Sample Details
Western Seepage	Potential migration of impacts from Ash Dam B via seepage to the western seepage collection area and offsite.	• Quarterly monitoring of MW40, MW49, MW56 and MW68

9.1.1 Deviations from the Addendum SAQP

Monitoring was not completed in accordance with the Addendum SAQP as follows:

- MW56 was not sampled during the Q1 (March 2023), Q2 (June 2023) or Q3 (September 2023) events due to the seepage recovery pump not being operational at the time of sampling. It has been reported that this bore has been dry since August 2023.

Following installation and development of additional monitoring bore MW98, sampling was completed during the Q3 (September 2023) and Q4 wet season (December 2023) quarterly monitoring events.

9.1.2 Field QA/QC

Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples as part of the wider groundwater and surface water investigation scope in accordance with the PFAS NEMP (refer **Section 4**). Further discussion of field duplicates is presented in **Appendix F**.

9.2 Groundwater Analytical Results

Groundwater analytical results are presented in **Table T1**, **Table T2** and **Table T3**, with a summary provided in **Table 26**.

Table 26. Western Seepage Area Investigation Results Summary

Investigation Scope	Monitoring Wells	Identified Risk/Target	Analytical Results
Initial EE Groundwater Investigation (2022)	MW40 MW41 MW49 MW55 MW56 MW57 MW58 MW68 MW98	Potential migration of impacts from Ash Dam B via seepage to the western seepage collection area and offsite.	**Groundwater Analytical Results** • All samples reported concentrations of PFBS, PFPeS, PFHxS, PFHpS and PFOS above the laboratory's LOR, with PFOS reported above the 99% species protection level in all samples. Concentrations of PFOS were also reported above the 95% species protection level in MW40, MW41, MW49 and MW68 in all monitoring events, and MW56 during three of the five monitoring events. • All samples reported concentrations of Sum of PFOS and PFHxS above the drinking water guideline of 0.07 µg/L, with all samples from MW49 also reported above the recreational guideline limit of 2 µg/L. • MW40, MW41, MW49, MW55, MW57 and MW68 reported detections of PCAs during some monitoring events, including PFBA, PFPeA, PFHxA, PFHpA and PFOA, with MW40, MW41 reporting detections of 6:2 FTS, and MW68 reporting detections of 6:2 FTS and 8:2 FTS. • Highest total PFAS concentrations were reported in MW49 at 4.34 µg/L on 20 January 2022. **TOPA Analytical Results** TOPA analysis was completed on MW41 (Nov20 and Jan21), MW49 (Nov20 and Jan21) and MW68 (Jan21), with percentage increases of total PFAS reported between 14 % (MW41, Jan21) and 47 % (MW41, Nov20) (refer **Table T8**). Based on the results, it is considered that groundwater at the western seepage area may contain an additional mass of PFAS precursors. **TOF Analytical Results** Analysis for TOF was completed on MW41 (Nov20 and Jan21), MW49 (Nov20 and Jan21) and MW68 (Jan21), with concentrations reported below the laboratory's LOR, indicating samples are unlikely to have a high percentage of other fluorinated organic compounds present.
Addendum EE Groundwater Investigation (2023)	MW40 MW49 MW56 MW68 MW98		**Groundwater Analytical Results** • Results for MW40, MW49 and MW68 were comparable to previous investigation results, with concentrations reported within historical ranges • All samples reported concentrations of PFOS above the 99% Species Protection limit, with concentrations reported above the 95% Species Protection limit during at least one sampling event in all wells excluding MW98 • All samples reported concentrations of the sum of PFOS and PFHxS above the Drinking Water Criteria of 0.07 µg/L, with concentrations reported above the Recreational Water Criteria of 2.0 µg/L in MW49 in March, June and September 2023

Investigation Scope	Monitoring Wells	Identified Risk/Target	Analytical Results
			• MW49 reported PFAS concentrations comparable to, and within the historical range in the western seepage area (total PFAS 0.718 to 4.34 µg/L, refer **Figure 17**), with a greater proportion of PFHxS (refer **Figure 18**) and highest concentrations (approximately one order of magnitude higher) than other wells (refer **Figure 19**) • MW98, installed immediately east of MW49, reported the lowest PFAS concentrations within the western seepage area bores (total PFAS 0.106 to 0.163 µg/L), with concentrations of PFOS (0.0400 to 0.0647 µg/L) and the sum of PFOS and PFHxS (0.0991 to 0.150 µg/L) reported above the 99% Species Protection limit and Drinking Water Criteria respectively **TOPA Analytical Results** TOPA analysis was completed on MW98 (Aug23) by GHD, with percentage increase of total PFAS reported at 8% (refer **Table T8**). Results for MW98 support previous investigation results which indicate that groundwater at the western seepage area may contain an additional mass of PFAS precursors. **TOF Analytical Results** Analysis for TOF was completed on MW98 (Aug23) by GHD with concentrations reported below the laboratory's LOR of 20 µg/L, indicating samples are unlikely to have a high percentage of other fluorinated organic compounds present.

9.3 Western Seepage Area Results Discussion

Groundwater results from the western seepage area reported PFAS composition to be comparable across all monitoring wells (**Figure 18**), with MW49 reporting a greater proportion of PFHxS (shown in green). MW49 also reported highest PFAS concentrations (**Figure 19**), with remaining locations reporting concentrations approximately one order of magnitude lower.

Groundwater monitoring well MW49 is located adjacent to where the Western Stormwater Diversion Channel exits the site, with results consistent across monitoring events completed between November 2020 and December 2023. This portion of the site is underlain by the alluvial soils associated with a former creek channel (refer **Figure F7**). The section of the Western Stormwater Diversion Channel near MW49 can also receive overflow from the Western Seepage Collection Pond should it overflow. MW49 is also likely outside of the current groundwater seepage capture area, with current recovery wells comprising MW55, MW56, MW57 and MW58. Surface water flows along the Western Stormwater Diversion Channel may pool within the former creek channel and infiltrate to alluvial soils, however, as discussed in the Initial CLID (Epic, 2022c), current surface water flows are unlikely to be the cause of high PFAS concentrations reported in MW49 based on PFAS concentrations reported in surface water (as represented by SW28, SW35 and SW46). Results for monitoring at MW98, located approximately 14 m east of MW49, indicate that elevated PFAS concentrations are likely to be localised, with concentrations of total PFAS approximately 10% of those reported in MW49. Monitoring well MW86, located approximately 250 m east of MW98, was reported to be dry.

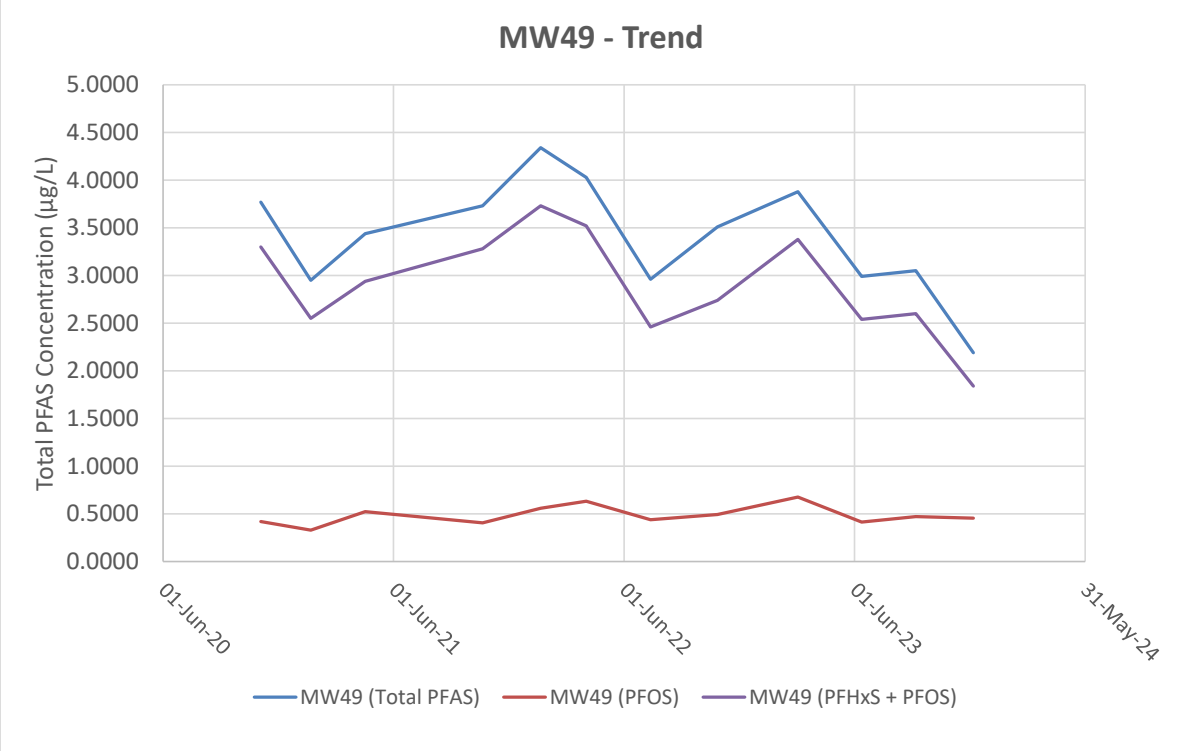

Figure 17. MW49 PFAS Concentration Trend

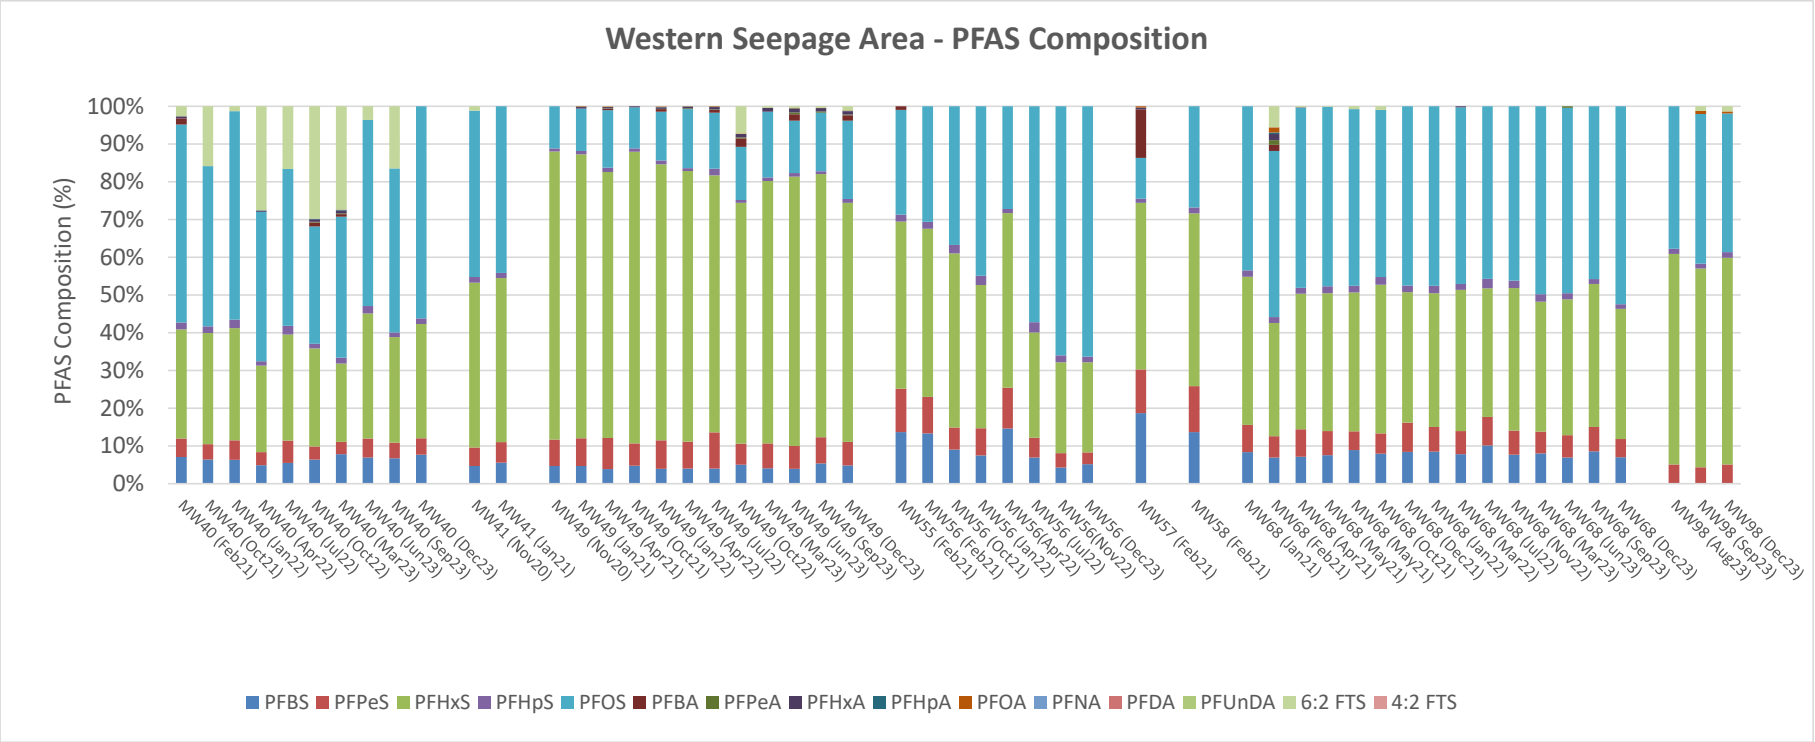

Figure 18. Western Seepage Area PFAS Composition in Groundwater

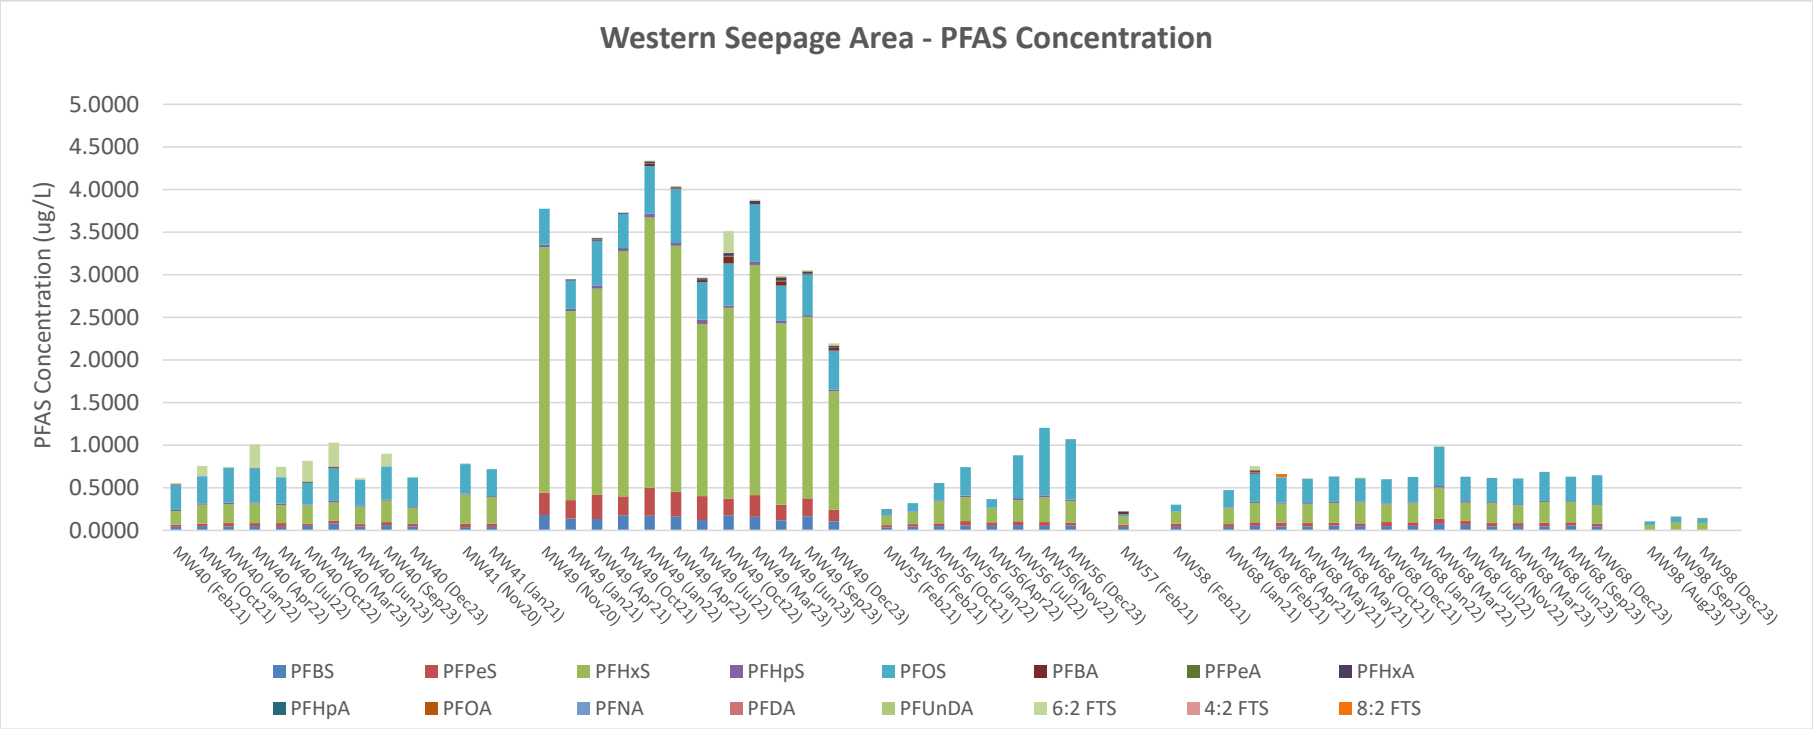

Figure 19. Western Seepage Area PFAS Concentrations in Groundwater

10 NORTHERN BOUNDARY (DATA GAP 6)

Previous investigation along the northern site boundary reported concentrations of PFAS in the three main watercourses entering the site as represented by sample locations SW33, SW34 and BS3-CW. Surface water samples collected from the three stormwater channels (northern watercourse BS3, northern watercourse east and northern water course central) reported concentrations of PFOS above the 99% species protection limit and Sum of PFOS and PFHxS above the drinking water criteria during at least one sampling event.

Additional investigation has been undertaken along the northern site boundary based on the addendum SAQP (Epic 2023a, **Appendix L**) to assess the nature of PFAS entering the site via these pathways.

A summary of the identified data gap and background information associated with the northern site boundary is presented in **Table 27**.

Table 27. Northern Boundary (Data Gap 5) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	High concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and western stormwater diversion channels. Further investigation will be required to assess the nature (including mass) of PFAS entering the site via these pathways. It is noted that management of PFAS impacts from these pathways will need to be undertaken in conjunction with remediation and/or management of offsite source areas.
Initial CLID Recommendation (Epic, 2022c)	Management of impacted surface water, groundwater and sediments along the northern site boundary will be required, however it is noted that the source of PFAS impacts is located offsite and owned by a third party. On this basis, any remediation or management of impacts identified at the site will need to be in collaboration with upgradient landowner(s) and DES. Temporary PFAS management options should be investigated (i.e. passive sorption water treatment technologies) to determine their suitability for interim management of PFAS impacted surface water, noting adoption and implementation of any technologies should be undertaken in collaboration with upgradient landowners and DES. Once offsite impacts have been adequately remediated or managed, measures should be implemented to manage any residual impacts (i.e. removal of impacted sediment).
Background and History	Groundwater results for background monitoring wells located along the northern (hydraulically upgradient) boundary indicated that groundwater located along the northern site boundary (as represented by MW01 and MW74) is likely to have been impacted from surface water entering the northern site boundary from the area of the mine (operated by Batchfire), which has reported elevated concentrations of PFAS (including SW34 and SW33).
Previous Investigation	Groundwater results for MW01 and MW74 reported detectible concentrations of PFAS compounds, with MW74 reporting concentrations of PFOS above the 99% species protection limit and Sum of PFOS and PFHxS above the drinking water criteria during the December 2021, April 2022 and July 2022 monitoring events. Both monitoring wells are located along the northern site boundary, north of operational areas and are considered to represent background groundwater quality. Groundwater monitoring well MW01 is located adjacent to the northern drainage channel (west), with surface water sampling location SW37 located upstream at the railway line culvert. Surface water at SW37 has reported detections of PFOS, PFBA, PFPeA, PFHxA and PFHpA with total PFAS reported up to 0.0235 µg/L (May 2021). MW01 has reported detections of PFPeA, PFHxA, PFHpA and 6:2 FTS with total PFAS reported up to 0.0500 µg/L (November 2020). Groundwater monitoring well MW74 is located adjacent to the northern drainage channel (east), with surface water sampling location SW34 located upstream at the railway line culvert. Surface water at SW34 has reported detections of PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFNA, 6:2 FTS and 8:2 FTS with total PFAS reported up to 6.62 µg/L (July 2021). MW74 has reported detections of FBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA, PFOA, MeFOSAA and 6:2 FTS with total PFAS reported up to 0.90 µg/L (April 2022). In general, the PFAS composition of MW74 and SW34 are comparable across all monitoring events (**Figure 20**). PFAS concentrations at SW34 are observed to be variable across the monitoring events (**Figure 21**), with concentrations within MW74 reported to be increasing over time.

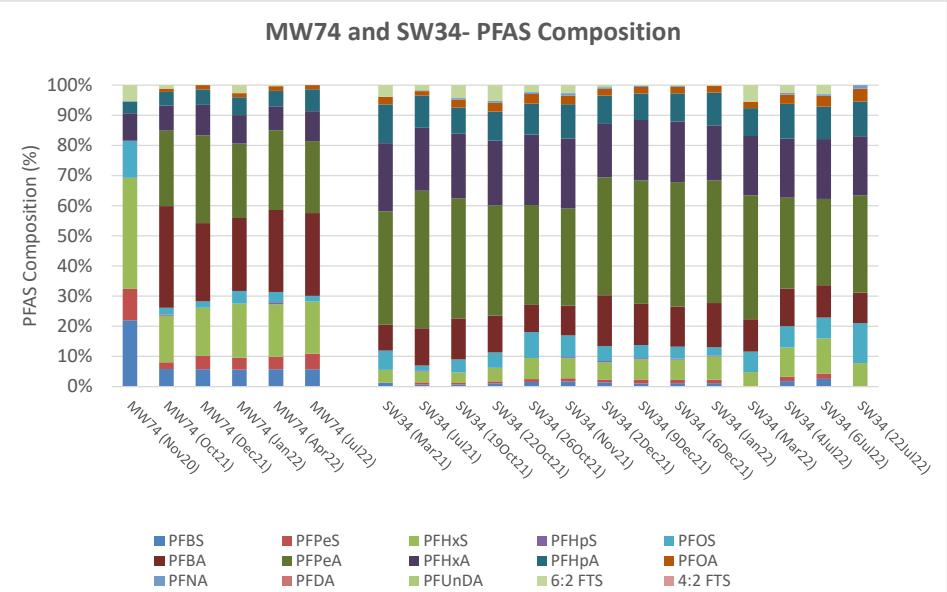

Figure 20. MW74 and SW34 – PFAS Composition in Groundwater (MW74) and Surface Water (SW34)(Epic, 2022c)

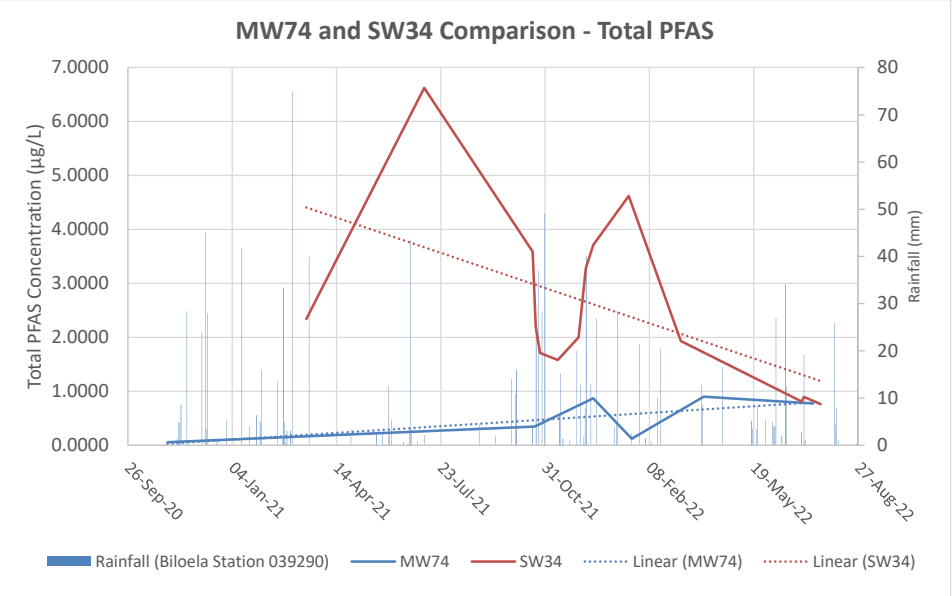

Figure 21. Total PFAS Concentrations – MW74 and SW34 (Epic, 2022c)

Surface water entering the northern (upgradient) site boundary from the area of the mine, has reported elevated concentrations of PFAS (including at location SW34 and SW37, with groundwater monitoring results indicating that groundwater entering the site along the northern site boundary (as represented by MW01 and MW74) is likely to have been impacted from these surface water flows. It is noted that based on the topography of areas north of the site, groundwater impacts may be localised to areas along the northern site boundary where surface water pools following flow events, with features including the railway line providing a constriction to surface water flows which can result in localised pooling of water.

10.1 Northern Boundary Investigation Scope

Ongoing surface water and groundwater monitoring was completed along the northern site boundary in accordance with the Addendum SAQP (Epic, 2023a) (**Appendix L**) and the methodology outlined in **Section 5** to provide ongoing assessment of PFAS within key migration pathways. Ongoing monitoring was completed on a

quarterly basis with sampling of surface water locations completed following rainfall events subject to access restrictions. Three additional surface water monitoring locations (BS3 CW, BS3 CWN and BS3 CWE) were established along the northern site boundary upgradient of BS3 (Ash Dam 3) to monitor inflows from two watercourse lines that feed into the clean water diversion drain installed around BS3. An existing surface water monitoring location (BS3) was included to monitor runoff from rehabilitated surfaces of BS3.

Details on the sampling locations are provided in **Table 25**, with monitoring locations shown on **Figure F8**. Laboratory documentation provided in **Appendix K**.

Table 28. Northern Boundary Additional Investigation Scope

Investigation Area/Target	Identified Risk/Target	Sample Details
Northern Watercourse BS3	Potential impacts from offsite sources to surface water entering the northern site boundary and managed as part of the northern and western stormwater diversion channel. Background monitoring location to assess hydraulically upgradient groundwater entering the site.	• Surface water monitoring locations BS3, BS3 CW, BS3 CWN, BS3 CWE, SW45
Northern Watercourse (East)		• Surface water monitoring locations SW34 • Groundwater monitoring well MW74
Northern Watercourse (Central)		• Surface water monitoring locations SW33 and SW06
BS3 (Ash Dam 3)	Monitoring of surface water runoff from the rehabilitated surface of BS3	• BS3

10.1.1 Deviations from the Addendum SAQP

Quarterly monitoring of surface water monitoring locations was not completed during each nominated event due to insufficient surface water being present to enable sampling. Additional surface water monitoring was completed following rainfall events where locations were able to be safely accessed during flow events. Monitoring was not completed in accordance with the Addendum SAQP as follows:

- Monitoring of SW33 and SW34 was not completed during the quarterly events due to the locations being dry. Sampling was completed by CS Energy's environmental team in December 2022 and January 2023 following rainfall events
- Monitoring of SW45 was only completed during the September and December 2023 monitoring events
- Monitoring of SW06 was not completed as part of the current investigation with the location dry during the quarterly monitoring events and inaccessible during rainfall events
- Monitoring of BS3-CW and BS3-CWN was limited to monitoring by CS Energy's environmental team in December 2022 and January 2023 following rainfall events
- Monitoring of BS3-CWE was not completed as part of the current monitoring event due to access restrictions during rainfall events. It is noted that BS3-CW is located downstream of BS3-CWE

10.1.2 Field QA/QC

Duplicate sample pairs were collected and analysed at a rate of 1 in every 10 primary samples as part of the wider groundwater and surface water investigation scope in accordance with the PFAS NEMP (refer **Section 4**). Further discussion of field duplicates is presented in **Appendix F**.

10.2 Surface Water and Groundwater Analytical Results

Surface water and groundwater analytical results are presented in **Table T1**, **Table T2** and **Table T3**, with a summary provided in **Table 29**.

Table 29. Northern Boundary Investigation Results Summary

Investigation Scope	Monitoring Location	Identified Risk/Target	Analytical Results
Initial CLID Groundwater Investigation (2022)	MW01[†] MW74	Potential impacts from offsite sources. Background monitoring location to assess hydraulically upgradient groundwater entering the site	**Groundwater Analytical Results** • Sampling of MW01 was only completed during the April 2022 event, with one previous monitoring event in November 2020. The majority of PFAS compounds reported raised LOR due to sediment, with detections of PFHxA (Nov20 and Apr22) and PFPeA, PFHpA and 6:2 FTS (Nov20) reported. • MW74 reported detections of several PSA and PCA compounds, with all samples reporting concentrations of PFOS above the 99% species protection level. Concentrations of Sum of PFOS and PFHxS were reported to exceed the drinking water guideline during the December 2021, April 2022 and July 2022 events. • Concentration of PFAS in MW74 are observed to be increasing, with highest concentrations reported during the April 2022 monitoring event. **TOPA Analytical Results** TOPA analysis was completed on samples collected during the November 2020 sampling event, with TOPA and standard analytical results observed to generally be comparable (**Table T8**). On this basis, it is considered that groundwater at MW01 and MW74 are unlikely to contain an additional mass of PFAS precursors. **TOF Analytical Results** • Analysis for TOF was completed on samples collected during the November 2020 sampling event, with MW01 and MW74 reporting concentrations below the laboratory's LOR, indicating samples are unlikely to have a high percentage of other fluorinated organic compounds present.
Addendum CLID Groundwater Investigation (2023)	MW74		• Concentrations of PFOS (0.015 - 0.024 µg/L) remained within the range of historical monitoring results (November 2020 to July 2022, 0.0047 – 0.0304 µg/L), with all results reporting concentrations of PFOS above the 99% Species Protection limit of 0.00023 µg/L • All samples reported concentrations of the sum of PFHxS and PFOS (0.150 – 0.384 µg/L) above the drinking water criteria of 0.07 µg/L, with results showing an increasing trend from historical monitoring results (November 2020 to July 2022, 0.0248 – 0.187 µg/L) • All samples reported an increasing trend for PCA compounds (PFBA, PFPeA, PFHxA, PFHpA, PFOA and PFNA) and 6:2 FTS, with total PFAS reporting a significant increase following the March 2023 quarterly event (refer **Figure 24**)

Investigation Scope	Monitoring Location	Identified Risk/Target	Analytical Results
Initial CLID Surface Water Investigation (2022)	SW33 SW34 SW35 SW37† SW45 SW46† SW06 SW28* SW48*	Background monitoring location to assess upgradient surface water entering the site along the northern site boundary and leaving the site via the Western Stormwater Diversion Channel (WSDC)	• All samples reported detection of PFAS above the laboratory's LOR with the exception of SW33 (Jul22), SW35 (Jul22) and SW28 (Jul22) which reported raised LORs due to sediment loads, with LORs raised above historical detections. • Highest concentrations were reported in SW34, with concentrations of PFOS exceeding the 99% and 95% species protection levels, and Sum of PFOS and PFHxS exceeding the drinking water criteria in all events. Samples generally reported detections of PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFNA and 6:2 FTS, with two samples also reporting 8:2 FTS. Highest total PFAS concentrations were reported during the July 21 event (total PFAS 6.62 µg/L). • Remaining locations (SW06, SW28, SW33, SW35, SW37, SW45, SW46 and SW48) reported a high degree of variability, with at least one sample reporting PFOS concentrations above the 99% species protection limit. Locations SW06, SW33, SW35, SW37, SW45, SW46 and SW48 also reported at least one sample with PFOS concentrations above the 95% species protection limit and Sum of PFOS and PFHxS above the drinking water criteria.
Addendum CLID Surface Water Investigation (2023)	SW33 SW34 SW45 SW06 BS3-CWN BS3-CWE BS3-CW		• Results for SW33 were comparable to historical monitoring events with detection of PSA and PCA compounds generally within the historical range, noting the laboratory's LOR was raised for a number of analytes • Results for SW34 were generally comparable to historical monitoring events with detection of PSA and PCA compounds generally within the historical range. Concentrations of PFOS were reported above the 99% Species Protection limit of 0.00023 µg/L during the October 2022, December 2022 and January 2023 monitoring events, with concentrations also exceeding the 95% Species Protection limit of 0.13 µg/L during the October 2022 and January 2023 events (and reporting the highest PFOS concentration to date during the October 2022 event at 0.195 µg/L). Concentrations of the sum of PFOS and PFHxS were reported above the Drinking Water criteria of 0.07 µg/L, with both events within the historical range • Results for the BS3 clean water diversion channel (BS3-CWN, BS3-CW and SW45) reported highest concentrations in BS3-CWN, with concentrations of PFOS (0.301 µg/L) reported above the 95% Species Protection limit of 0.13 µg/L and the sum of PFOS and PFHxS (0.595 µg/L) reported above the Drinking Water criteria of 0.07 µg/L. All three locations reported detections of PSA and PCA compounds and 6:2 FTS, with concentrations showing a general reduction from the northern boundary (BS3-CWN) past BS3 (BS3-CW) and into the northern stormwater diversion channel (SW45). All three locations reported concentrations of PFOS above the 99% Species Protection limit and the sum of PFOS and PFHxS above the Drinking Water criteria, with PFOS also reported above the 95% Species Protection limit on at least one occasion.

Notes: † Monitoring location not included in additional investigations as detailed in the Addendum SAQP (Epic 2023a)
* Monitoring location along southern site boundary representing surface water exiting the site via the western stormwater diversion channel

10.3 Northern Boundary Results Discussion

Surface water results for samples collected along the northern site boundary generally report PFAS concentrations comparable to historical monitoring events (November 2020 to July 2022), with PFAS detected in all three watercourses entering the site along the northern site boundary. All results reported concentrations of PFOS above the 99% Species Protection limit of 0.0023 µg/L (or a raised LOR), with SW34, SW45, BS3 CW and BS3 CWN also reporting concentrations above the 95% Species Protection limit of 0.13 µg/L during at least one monitoring event and concentrations of the sum of PFOS and PFHxS above the Drinking Water criteria of 0.07 µg/L.

Highest PFAS concentrations (during the period of this Addendum CLID) were reported at SW34 which reported a total PFAS concentration of 2.19 µg/L in January 2023, with BS3 CWN reporting a total PFAS concentration of 2.03 µg/L in December 2022. The results indicate that the majority of PFAS mass is likely to enter the site's northern boundary via the northern watercourse east (SW34) and the northern watercourse BS3 (BS3 CWN), with lesser contribution from the northern watercourse central (SW33) and the eastern branch of the northern watercourse BS3 (BS3 CWE). Statistical analyses[7] of monitoring results from SW33 and SW34 is presented in **Table 30**, with results showing PFAS concentrations reported at SW34 are generally one to two orders of magnitude higher than concentrations reported at SW33.

Table 30. Northern Boundary Surface Water Statistical Analysis

Location	Analyte	Obs[1]	Non-detects[2]	Max	Min	Mean	Geo-mean	SD	95% UCL[3]
SW33	PFOS	5	8	0.0144	0.0032	0.00792	0.0069	0.00447	0.0122
	∑ PFOS & PFHxS	7	6	0.0233	0.0032	0.0125	0.0105	0.00696	0.0176
	Total PFAS	12	1	0.193	0.0124	0.0758	0.0597	0.0547	0.104
SW34	PFOS	18	0	0.195	0.0575	0.125	0.12	0.036	0.140
	∑ PFOS & PFHxS	18	0	0.481	0.136	0.272	0.257	0.0939	0.311
	Total PFAS	18	0	6.62	0.761	2.406	2.046	1.487	3.016

Notes: [1] Number of observations above laboratory's limit of reporting
[2] Number of observations below laboratory's limit of reporting
[3] Student's-t UCL

Results from the current investigation support previous findings that high concentrations of PFAS are entering the site via the watercourses along the northern site boundary, with PFAS concentrations observed to decrease as water travels along the northern and western stormwater diversion channel. The observed reduction is likely to be associated with mixing and dilution with other surface water inputs with no, or lower concentrations of PFAS. Concentrations of PFAS reported at SW28, at the southern extent of the Western Stormwater Diversion Channel (southern boundary of the site, refer **Figure F3**) reported PFAS concentrations approximately one to two orders of magnitude lower, however concentrations of PFOS were still reported above the 99% Species Protection limit.

It is noted that monitoring of surface water runoff from the rehabilitated ash dam BS3 (Ash Dam 3) reported concentrations of PFAS below the laboratory's LOR in January 2023, with PFOS (0.0003 µg/L) reported marginally above the LOR of 0.0002 µg/L in December 2022. Based on current and historical monitoring of runoff from BS3, the rehabilitated Ash Dam 3 is not considered to comprise a PFAS source area, or be contributing to PFAS concentrations observed along the northern site boundary or further downstream.

Groundwater results for MW74 reported detectible concentrations of PFAS compounds, with MW74 reporting concentrations of PFOS (0.015 - 0.0224 µg/L) above the 99% species protection limit and Sum of PFOS and PFHxS PFOS (0.150 – 0.384 µg/L) above the drinking water criteria during the current monitoring events (November 2022 to December 2023).

[7] Statistical analysis was completed using ProUCL 5.2, with calculations presented in **Appendix R**.

Groundwater monitoring well MW74 is located adjacent to the northern drainage channel (east), with surface water sampling location SW34 located adjacent and upstream at the railway line culvert. Previous investigations (Epic 2022a) reported that groundwater located along the northern site boundary (as represented by MW74) is likely to have been impacted from surface water entering the northern site boundary from the area of the mine (operated by Batchfire), with the composition of PFAS compounds comparable between MW74 and SW34 across all monitoring events. Results from the current monitoring events supports previous conclusions, with PFAS composition remaining comparable between MW74 and SW34 (**Figure 22**). Current results have however, reported an increase in total PFAS concentrations at MW74, with a corresponding decrease observed in SW34 (refer **Figure 23** and **Figure 24**), noting however that monitoring of SW34 was not completed after January 2023. The increase in PFAS concentrations at MW74 is attributed to increases in PFHxS, PCA compounds (PFBA, PFPeA, PFHxA, PFHpA, PFOA and PFNA) and 6:2 FTS, with PFOS concentrations remaining stable across all monitoring events. The increases observed in these compounds during March to December 2023 is reflected in the PFAS composition data as shown in **Figure 22**.

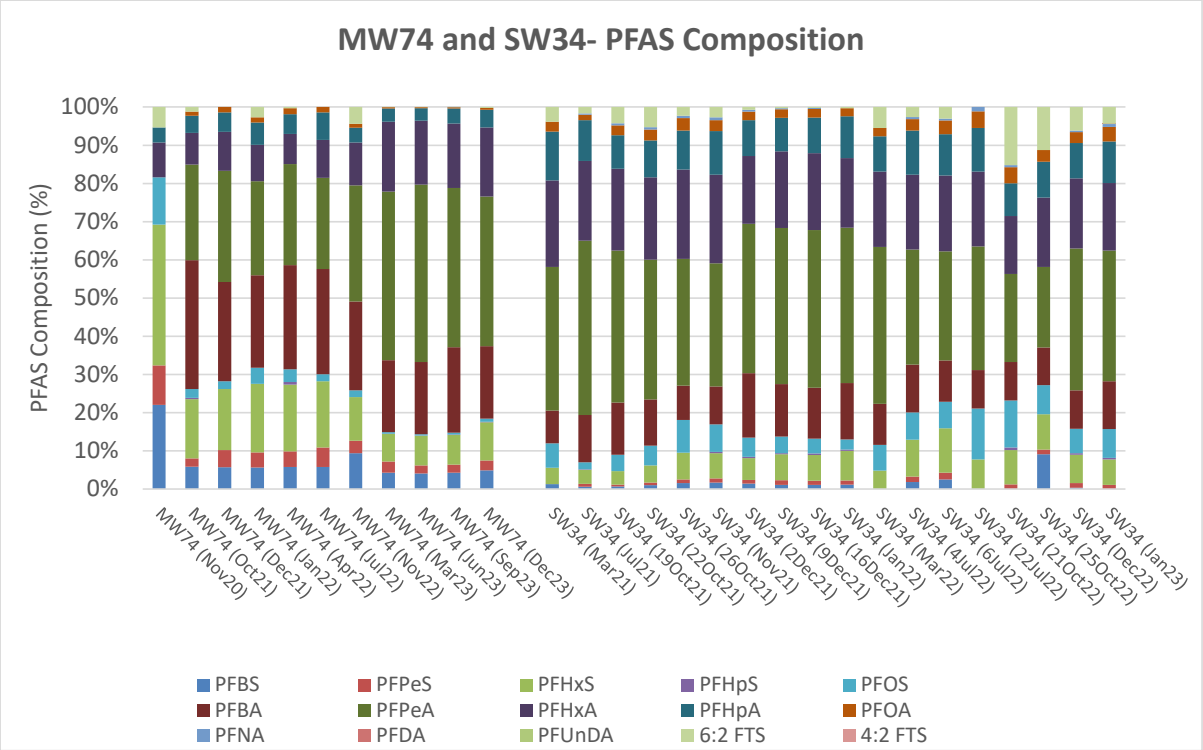

Figure 22. MW74 and SW34 – PFAS Composition in Groundwater (MW74) and Surface Water (MW34)

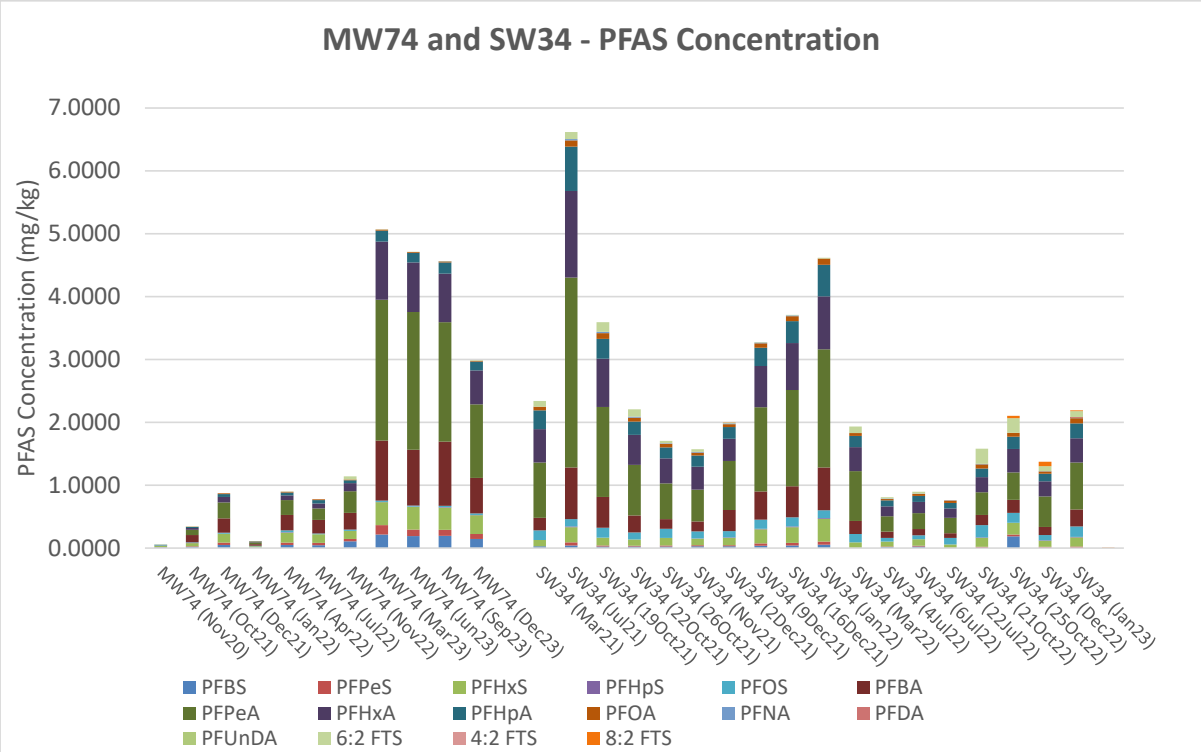

Figure 23. MW74 and SW34 – PFAS Concentration

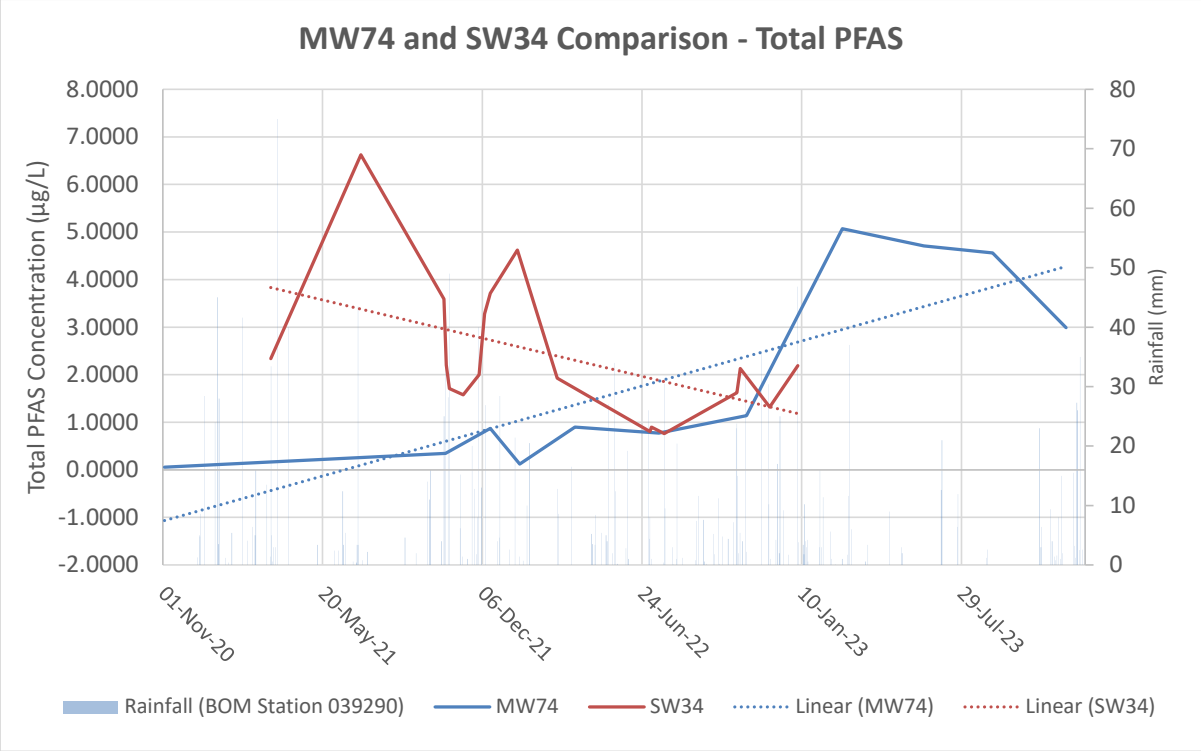

Figure 24. Total PFAS Concentration Trend – MW74 and SW34

10.4 Northern Boundary Flow Monitoring

CS Energy installed two LoRaWAN LDDS75 Distance Detection Sensors at the stormwater culverts adjacent to SW33 and SW34 to provide real time monitoring of water levels within the culverts. Sensors were installed in February 2023 as a temporary monitoring solution prior to installation of a more permanent solution, and recorded data between 5 February 2023 and 5 February 2024. Review of data recorded indicates no clear correlation between site recorded rainfall and water levels within the culverts. **Figure 25** shows an extract from the sensor output which indicates a potential response in SW33 from rainfall recorded on 22 December 2023, however no response is recorded on 17 December 2023 for corresponding rainfall, and SW34 reports no response associated with any reported rainfall and an erroneous response on 7 January 2024. Both sensors report loss of signal between 22 December 2023 and 2 January 2024. Inspection of the sensors noted the presence of insects (webs and nests) obstructing the sensors and preventing accurate readings. A copy of the sensor outputs is included in **Appendix S**.

On the basis that suitable data was not able to be obtained, calculation of the mass flux of PFAS entering the site along the northern site boundary has not been completed.

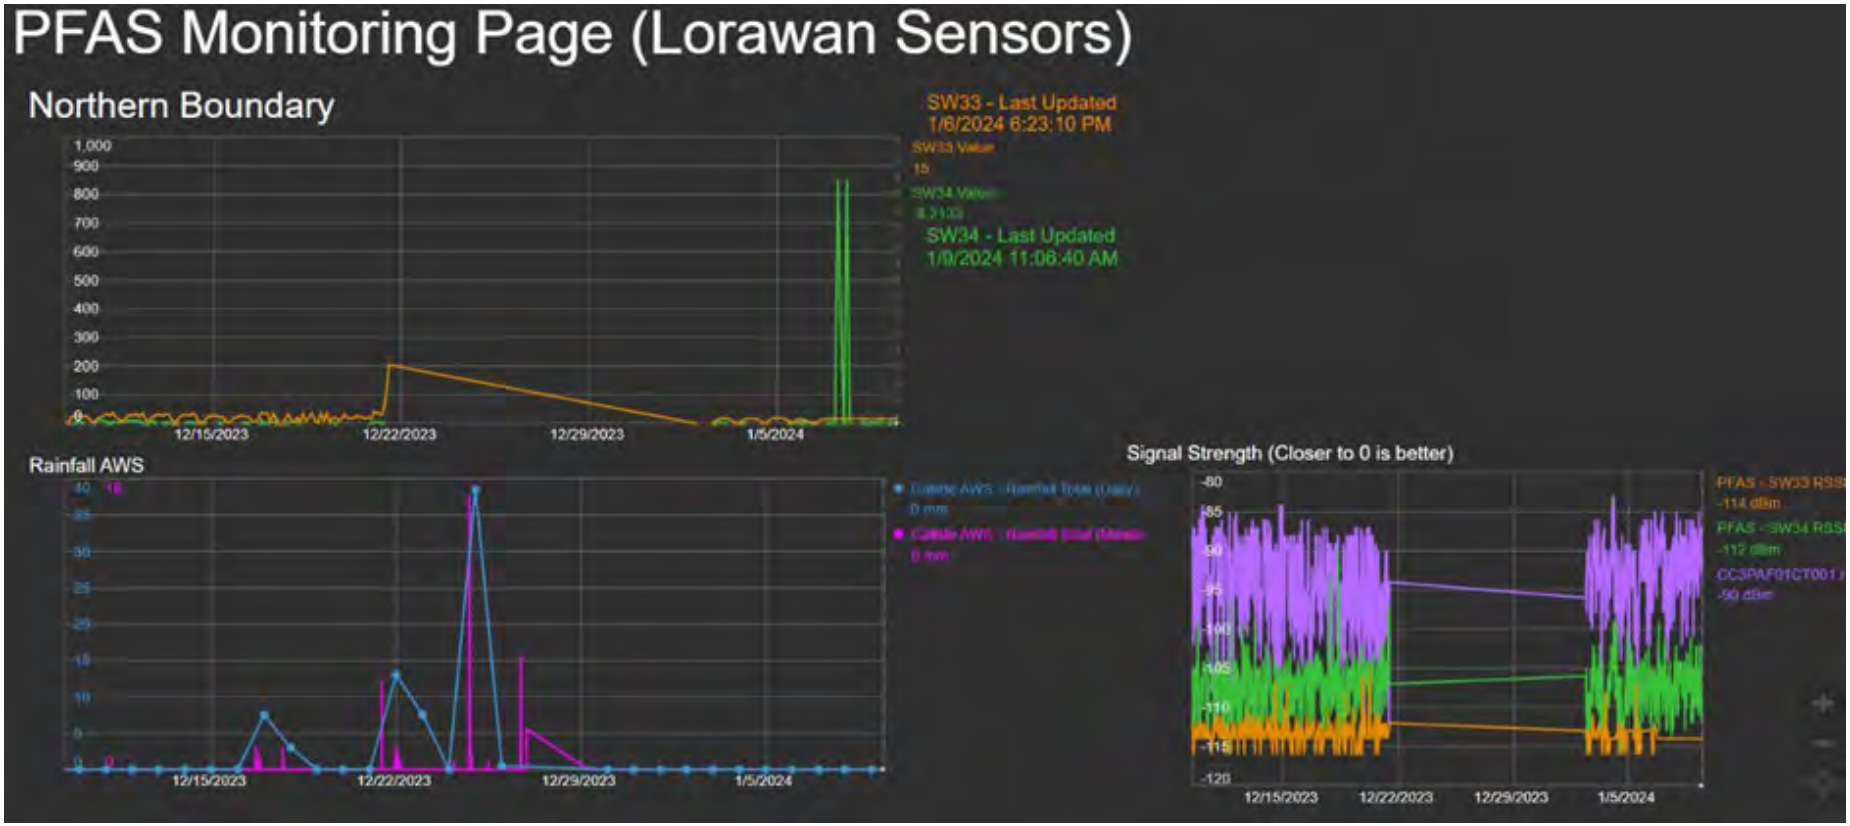

Figure 25. Northern Boundary Sensor Example Output

To enable monitoring of water flows entering the site along the northern boundary, CS Energy have commissioned Hydrobiology to install the following engineering solutions at the site:

- SW34 – Concrete ford crossing consisting of a custom designed concrete apron to allow for the calculation of flow rates and monitoring.
- SW33 – Installation of a submersible pressure transducer and depth velocity sensor within the existing concrete culvert

Installation of the engineering solutions is proposed to be completed by mid 2024.

11 AQUATIC BIOTA (DATA GAP 7)

Desktop review completed as part of the Initial CLID (Epic, 2022c) identified 9 target locations and target species for aquatic biota sampling to assess risk to human and ecological receptors.

Hydrobiology Pty Ltd (Hydrobiology) was subcontracted to complete an aquatic biology assessment in accordance with the Biota Sampling Plan provided in Appendix E of the Initial CLID (Epic, 2022c). The investigation was completed in early February 2023 and assessed the biota tissue contaminants, habitat condition, macroinvertebrate community and aquatic biota of each target sampling site.

Table 31. Aquatic Biota (Data Gap 7) Summary

Information sourced from Addendum SAQP (Epic, 2023a) and CLID (Epic, 2022c)

Aspect	Details
Initial CLID Data Gap (Epic, 2022c)	Potential risks to human and ecological health have been identified. Further assessment of risk will be required to be completed to quantify potential risks to human and ecological receptors. It is noted that biota sampling is proposed to be completed to inform potential risks to ecological receptors.
Initial CLID Recommendation (Epic, 2022c)	Completion of proposed biota sampling is recommended to be undertaken during the next wet season period. Sampling should be undertaken in accordance with the sampling plan. Following completion of biota sampling, a Human Health and Ecological Risk Assessment (HHERA) should be completed to assess potential risks to human health and ecological receptors.
Previous Investigation	Epic completed a desktop review to inform the approach for completion of aquatic biota sampling to satisfy the requirements of the EE that relate to biota, human consumption of biota, and bioaccumulation risk. The desktop assessment identified target species and sampling locations, with five primary, and three secondary target species identified to enable assessment of ecological and human health risks, as detailed in **Table 32.** Sampling was proposed to be completed at seven sampling sites within the investigation area (Callide Creek catchment/Callide Dam), along with one control site (upstream of Callide Dam) and one reference site (located in the adjacent Kroombit Creek catchment).

Table 32. Selected Target Species (Epic, 2022c, Appendix E)

Target Species		Intended Main Indicator Type[1]	
Primary Species	**Secondary Species**	**Human Health Risk**	**Ecological Risk**
Barramundi (*Lates calcarifer*)	Golden Perch (*Macquaria ambigua*)	✓	×
Eel-tailed Catfish (*Tandanus tandanus*)	-	×	✓
Eastern Rainbowfish (*Melanotaenia splendida splendida*)	Spangled Perch (*Leiopotherapon unicolour*)	×	✓
Redclaw Crayfish (*Cherax quadricarinatus*)	Freshwater yabby (*Macrobrachium* sp.)	✓	×
Fresh water mussels (*Velesunio* sp.)	-	×	✓

[1] The intended main indicator type for each species is identified in this table. It is noted that all of the selected human health risk indicators can also serve as ecological risk indicators. If necessary, the main indicator type designations can be modified during the sampling program (e.g. some human health risk indicators could also be used as ecological risk indicators) depending on the species present and abundance of individuals at each site.

11.1 Aquatic Biota Investigation Scope

Hydrobiology undertook aquatic biota investigations in accordance with the Biota Sampling Plan provided in Appendix E of the Initial CLID (Epic, 2022c) between 30 January 2023 and 3 February 2023. Investigations were completed in accordance with the Biota Sampling Plan and Queensland and Commonwealth guidelines and licence requirements, and included:

- Habitat condition assessments

- Macroinvertebrate sampling
- Collection of aquatic biota to inform the human and ecological health risk assessments

11.2 Investigation Results and Discussion

A summary of results from the aquatic biota investigation is provided in **Table 33**, with the Hydrobiology report containing further details on investigation findings and results included in **Appendix M**.

Table 33. Summary of Aquatic Biota Investigation Results

Investigation Scope	Locations	Identified Risk/Target	Results
Ecological and Contaminants Report, Hydrobiology (July 2023)	• AB1: Upstream Callide Creek (Control) • AB2 and AB3: Lake Callide • AB4 to AB8: Downstream Callide Creek • AB9: Lake Kroombit (Reference)	Habitat condition, macroinvertebrate biodiversity and assessment of potential risk to human and ecological receptors	• Habitat condition, aquatic biota, and macroinvertebrate communities varied between control/ reference sites and test sites • Upstream of Callide Dam within Callide Creek habitat condition was excellent and aquatic biota and macroinvertebrates were abundant and diverse for this system • Evidence of disturbance was present within Callide Creek downstream of the site based on habitat condition, water quality and macroinvertebrate assemblages • Habitat quality overall was in good to excellent condition with most sites limited due to lower water depth, availability of micro and macrohabitats and by fine sediment content • Lake Callide was able to support similar, and in some cases more diverse aquatic biota and macroinvertebrates communities than the reference site Lake Kroombit • Dissolved oxygen was low across all sites, in particular downstream of Lake Callide • PFOS was detected in biota samples collected from sites along Callide Creek both upstream and downstream of the Callide Power Station • PFOS was not detected in biota samples collected from within Lake Callide and Lake Kroombit • Highest concentrations of PFOS were recorded at the furthest site downstream from the site (SW41, Callide Wier) • Concentrations of metals and fluoride in biota samples did not show an obvious trend between control/reference sites and test sites • Where guidelines were available most metals/metalloid concentrations were below guideline values, except for zinc • Zinc concentrations were above guideline levels regardless of species or site, and likely to be indicative of regional influences rather than impacts associated with the power station

11.3 Aquatic Biota Results Discussion

Historical surface water sampling within Callide Creek has reported concentrations of Perfluoroalkyl Sulfonic Acids (PFBS, PFPeS, PFHxS, PFHpS and PFOS) and Perfluoroalkyl Carboxylic Acids (PFBA, PFPeA and PFHxA) and Fluorotelomer Sulfonic Acids (6:2 FTS) compounds, with sampling completed within Callide Dam reporting detections of PFBS, PFPeA and PFHxA on one occasion.

Results from aquatic biota sampling reported detections of PFAS in 15 of the 40 samples collected, with 14 samples only reporting detections of PFOS, and one sample (AB4-TT-EP, eeltail catfish) reporting detections of PFOS (4 µg/kg) and PFHxS at the laboratory's LOR of 1 µg/kg. It is noted that a number of PFAS compounds detected in surface water are not considered to be bioaccumulative and as such would not be expected to be detected in biota samples.

One sample collected upstream of Callide Dam (AB1-PR-EP, Rendahl's Catfish, 2 µg/kg) reported concentrations of PFOS marginally above the laboratory's LOR of 1 µg/kg (and below both the human health and ecological criteria), with remaining samples collected from Callide Dam, Callide Creek upstream of Callide Dam and Kroombit Dam reporting no detectible PFAS.

Comparison of PFOS concentrations in aquatic biota with average concentrations of PFOS in corresponding surface water monitoring locations (**Figure 26**) indicates highest concentrations of PFOS in aquatic biota are generally associated with highest average surface water concentrations, with higher concentrations reported in samples collected furthest downstream of the site at the Callide Weir. It is noted that monitoring locations further downstream from the site comprised larger waterbodies and included the Callide Weir, which may also contribute to higher concentrations in aquatic biota due to the presence of increased habitat complexity to support biota and longer residence times due to greater availability of food sources. This longer residence time could be a contributing factor to the higher PFOS levels. It is also noted that the Callide Weir is situated in an area that may include other PFAS sources such as industrial land uses, historical firefighting activities and historical agriculture facilities.

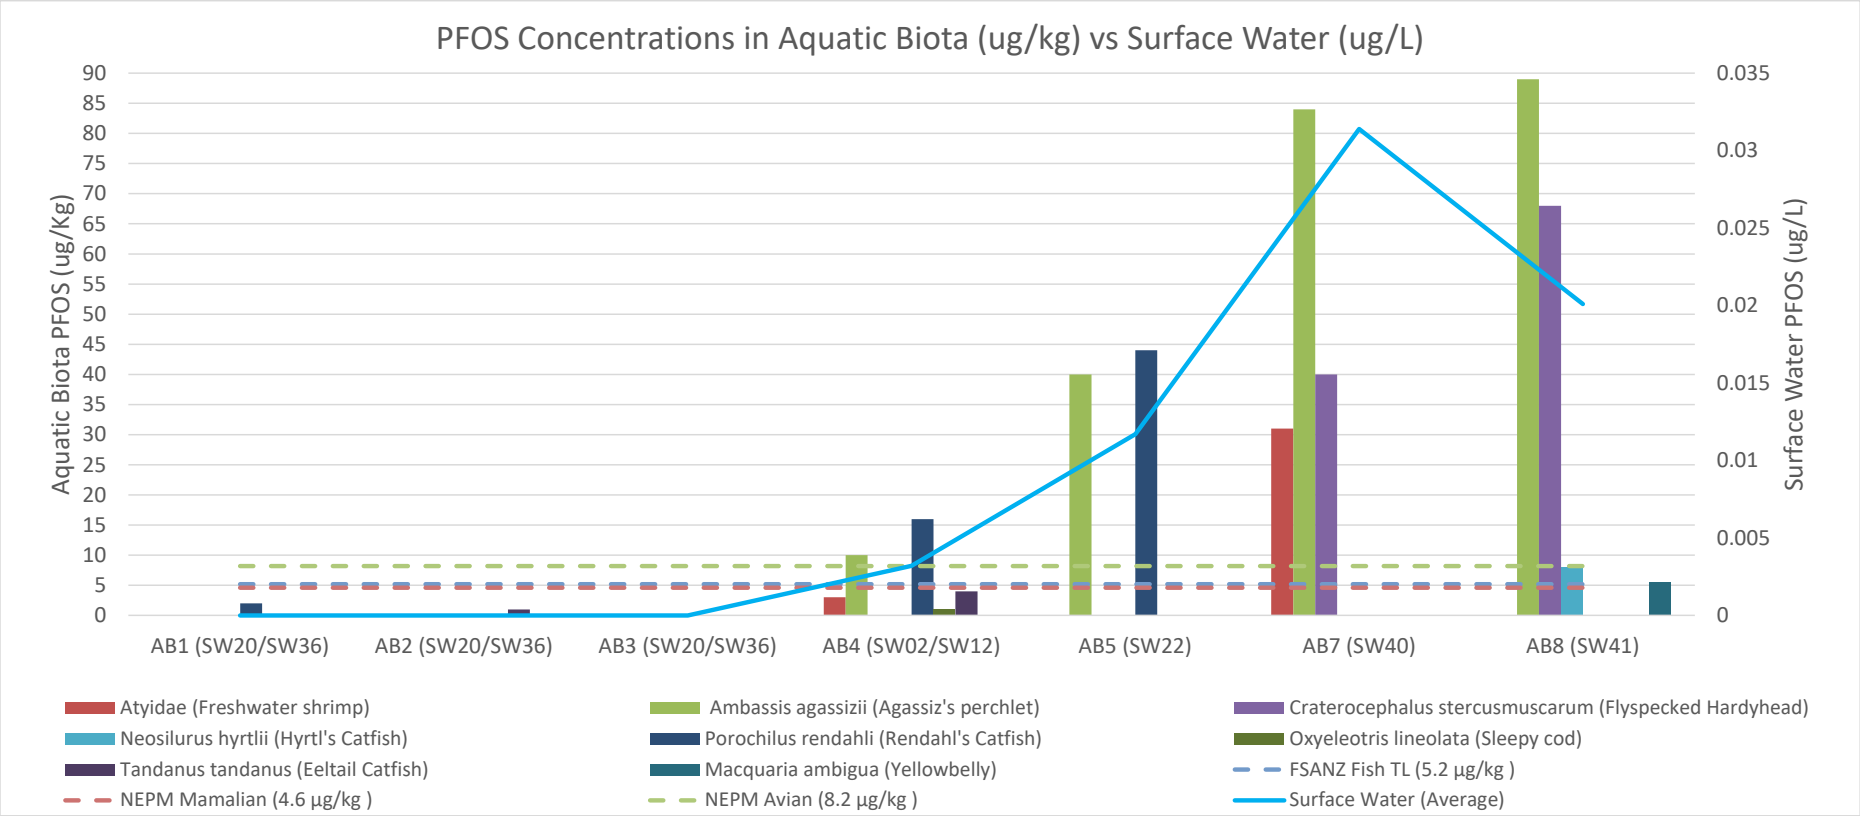

Figure 26. PFOS Concentrations in Aquatic Biota vs Surface Water

11.3.1 Potential Human Health Risks

A total of four of the target human health species (three catfish species and one Yellowbelly) reported concentrations of PFOS exceeding the Food Standards Australia and New Zealand (FSANZ) trigger point criteria (FSANZ, 2017) for fish of 5.2 µg/kg for PFOS[8], with a maximum concentration of 44 µg/kg reported in sample AB5-PR-EP (Rendahl's Catfish). It is noted that one of these samples (AB8-MA-EP, Yellowbelly from Callide Weir) reported concentrations of PFOS within edible portions (fillets) below the criteria, however analysis of the remaining portions (i.e. frame, gills, organs) reported concentrations above the criteria.

PFAS was not detected in any of the human health target species sampled from Callide or Kroombit Dams (including Barramundi and Red Claw Crayfish).

11.3.2 Potential Ecological Risks

A total of 12 samples reported concentrations of PFOS exceeding the PFAS NEMP biota guideline value (for sum of PFOS and PFHxS) for mammalian diet (4.6 µg/kg[9]), with nine of these samples also exceeding the guideline value for avian diet (8.2 µg/kg). All exceedances were reported in sampling locations within Callide Creek downstream of the site (AB4 to AB8). The highest concentration of 89 µg/kg was reported in sample AB8-AA-WB (Agassiz's Perchlet) within Callide Weir.

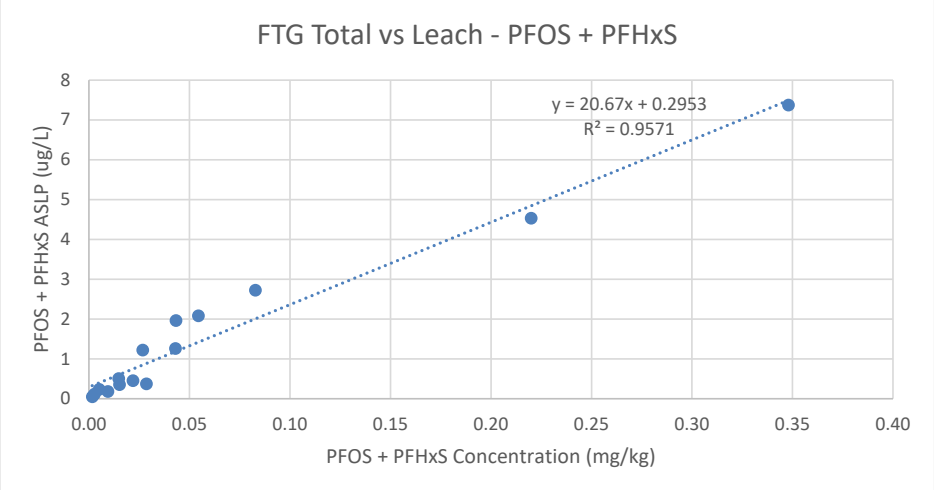
With the exception of sample AB8-MA-EP (Yellowbelly from Callide Weir) only edible portions were analysed for target human health species, and additional samples close to the biota guideline values (i.e. AB4-TT-EP) may exceed where whole body concentrations are considered (noting sample AB8-MA-EP reported comparable concentrations of PFOS in edible and non-edible portions).

[8] The FSANZ trigger point criteria was calculated using the body weight of a small child (2-6 years old, 19kg) and consumption of 73g of fish per day. The FSANZ trigger limit is designed to inform where additional assessment of potential risk would be required and is considered to be conservative trigger limit.

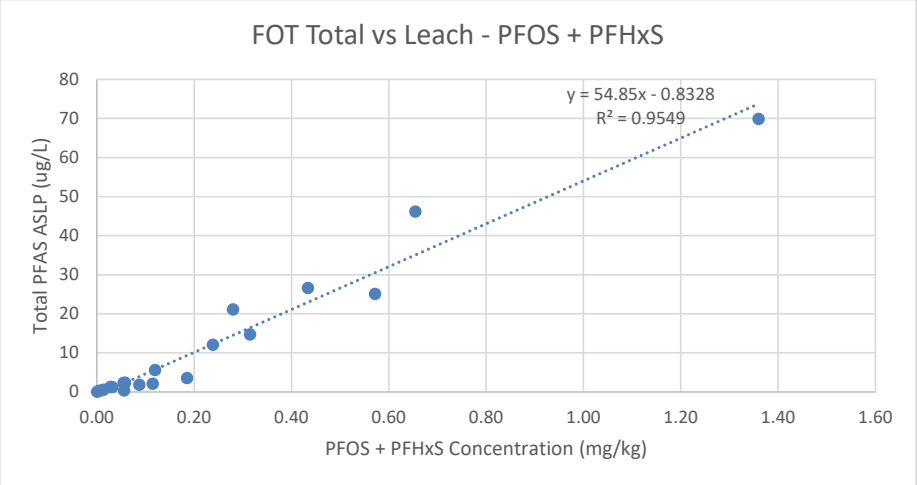
[9] It is noted that the Department of Climate Change, Energy, the Environment and Water's 2022 Draft PFAS National Environmental Management Plan Version 3.0 (PFAS NEMP 3.0), currently issued for public consultation and not yet endorsed by the QLD Regulator (DES), proposes a revised mammalian diet guideline value of 3.1 µg/kg. Review of results indicates that one additional sample (total of 13) would exceed the proposed revised mammalian diet guideline value.

12 SOIL REMEDIATION (FIRE TRAINING GROUND AND FUEL OIL TANKS)

Soil investigations completed as part of the Initial CLID (Epic, 2022c) confirmed the fuel oil tanks (FOT) and fire training ground (FTG) as primary PFAS source areas, associated with the historical use of AFFF at both locations. As noted in the Initial CLID (Epic, 2022c), CS Energy had appointed a remediation contractor (Enviropacific Services Limited) to undertake remediation of the FTG and FOT area.



Remediation works were completed between October 2022 and August 2023 and included excavation of soil with elevated PFAS concentrations, chemical stabilisation through addition of powdered activated carbon (PAC) and physical amelioration with bentonite prior to reinstatement of the soil.



It is noted that remediation of PFAS soil source areas was not required to be completed as part of works associated with the EE, with remediation and validation works completed as part of CS Energy's ongoing management of PFAS at the Callide Power Station site. A summary of relevant remediation works, including supporting documentation, has been included for completeness, noting that completion of remediation works occurred concurrently with the addendum EE investigation scope. Furth details of remediation works, including the remediation options assessment, adopted remediation methodology and remediation and validation works will be reported separately to this addendum EE report.

A summary of the soil remediation works is presented in **Table 34**, with validation sample locations presented on **Figure F10** (FOT) and **Figure F11** (FTG). Laboratory documentation provided in **Appendix K**.

Table 34. Soil Remediation Summary

Aspect	Details
Initial CLID Recommendation (Epic, 2022c)	Remediation of PFAS impacted soils identified at the fire training ground and fuel oil tanks should be undertaken to the extent practicable to prevent or minimise potential ongoing risks to ecological and human health receptors. Highest concentrations of PFAS were reported in areas immediately surrounding the Fuel Oil Tank bund and the Fire Training Ground bund, and are considered to represent the extent of primary impacts associated with the historical use/release of AFFF, however, it is noted that residual impacts in surrounding areas was reported. It is noted that at the time of reporting, CS Energy has appointed a remediation contractor to undertake remediation of the FTG and FOT area. Remediation is proposed to comprise onsite stabilisation through addition of a powered activated carbon product.
Background and History	**Fuel Oil Tanks** The FOT contains a low expansion foam system, with 4,400L aboveground AFFF holding tank. Two release events (training) were reported to have historically occurred, with each releasing approximately 2,000L of AFFF. Released foam filled a primary containment bund (concrete), with wind drift of foam reported to occur over the adjacent fire water tank area (limited and sporadic coverage). ERT training events (simulation of fire in bund) were also completed at the Fuel Oil Tank area, with foam released to the adjacent roadway and grassed areas. Less than 20L of AFFF reported to have been used during each event, over several training events. Equipment was reported to be flushed onsite onto the adjacent grassed area. It is estimated that up to approximately 100L of AFFF concentrate has historically been released around the Fuel Oil Tank. **Fire Training Ground** The FTG area consists of a concrete slab with primary bund, with secondary concrete bunds located within the main bund, and used for specific training scenarios. Training was reported to be completed using AFFF (<20L per event) and extinguishers, with approximately 10 to 15 training events estimated to have occurred. The primary bund was observed to be incomplete on the north-west and north-east corners (missing sections of bund), with water able to discharge to ground and then to the DRD via an earthen stormwater channel. It is reported that residual materials were not removed, and the bunded area was not cleaned following training.

	It is estimated that between 60L to 200L of AFFF concentrate was historically released at the FTG.
Previous Investigation	Based on the results of initial site investigations (Epic 2021a) which identified PFAS impacts associated with historical AFFF use at the FOT and FTG, a detailed soil investigation was undertaken to delineate the vertical and lateral extent of PFAS soil contamination and inform remediation and/or management of impacts, as reported in Epic, 2022c. A total of 82 investigation locations were advanced at the site in October 2021, with details outlined in the EE CLID (Epic, 2022c). Review of analytical results for the FTG reported a range of variability in PFAS composition and concentration. Locations in close proximity to the concrete bund reported the detections of PSAs, PCAs and Fluorotelomer Sulfonic Acid (FSA) compounds, with the southern laydown area and embankment areas generally only reporting the presence of PSA and PCA compounds. Samples collected in drainage lines and surface water flow paths reported detection of the most PFAS compounds, with samples FTG-Sed1 and FTG-Sed2 reporting detection of 20 of the 28 PFAS compounds analysed. No clear trend or PFAS signature is visible in soil data from the FTG, which may indicate a number of different foam products have been utilised during training activities. It is noted that the composition of PFAS reported at the FTG does not match composition of recent Ansulite foams reported to have been used at the site which show a signature of mostly PCA compounds. Leachability results mirrored soil results, with a high degree of variability in PFAS compositions. Leachability results for ASLP and Toxicity characteristic leaching procedure (TCLP) methods were generally comparable in composition, with higher concentrations reported for leachability analysis performed under neutral conditions (ASLP). Concentration of PFOS, the sum of PFOS and PFHxS and Total PFAS at the FTG were reported to be leachable at an average of 52%, 56% and 66% of the total concentration respectively (refer **Table T7**). A strong linear relationship was reported between ASLP and total concentrations (**Figure 27**) enabling prediction of likely leachability of remaining samples.  **Figure 27. Fire Training Ground Soil Leachate Comparison (Epic, 2022c)** Based on the history of the FTG area, it is considered that PFAS results in soil reflect the historical use of multiple AFFF products for training purposes. Review of analytical results for the FOT reported comparable PFAS composition across the majority of test locations, with perfluoroalkyl sulfonic acid compounds comprising the main functional group and PFOS the main compound by percent composition. One notable exception is FOT18, located adjacent to the AFFF storage tank area which reported approximately 70% fluorotelomer sulfonic acids by percent composition, with the main contribution being 6:2FTS.

	Results indicate that historical use and release of AFFF at the fuel oil tanks is likely to be associated with a singular (or small number of) foam product, with the possibility of a small, localised spill event or release adjacent to the AFFF tank (as represented by the different composition observed in FOT18). It is noted that the composition of PFAS reported at the FOT does not match composition of recent Ansulite foams reported to have been used at the site which show a signature of mostly PCA compounds and is likely indicative of historical foam products used at the site. Leachability results mirrored soil results, with similar PFAS compositions. Leachability results for ASLP and TCLP methods were generally comparable in composition, with higher concentrations reported for leachability analysis performed under neutral conditions (ASLP). Concentrations of PFOS, the sum of PFOS and PFHxS and Total PFAS at the FOT were reported to be leachable at an average of 72%, 74% and 79% of the total concentration respectively (refer **Table T7**). A strong linear relationship was reported between ASLP and total concentrations enabling prediction of likely leachability of remaining samples (**Figure 28**).  **Figure 28. Fuel Oil Tanks Soil Leachate Comparison (Epic, 2022c)**
Proposed Remediation Strategy	The remediation strategy proposed by Enviropacific comprised chemical stabilisation of PFAS impacted material onsite to reduce the leachability of the residual PFAS mass present in soils. Further details are included in Enviropacific's Remediation Plan provided in **Appendix P**. Based on the results of soil investigations, a soil remediation criteria of 0.04 mg/kg was adopted to inform soils requiring remediation. The adopted criteria was based on the investigation results, and the primary objective of minimising ongoing contribution of PFAS from soil to groundwater pathways at concentrations which may exceed the Drinking Water Guideline Criteria of 0.07 µg/L. All soils within accessible areas with concentrations of the sum of PFOS and PFHxS at or above 0.04 mg/kg were proposed to be remediated at the FOT and FTG.
Bench-Scale Treatment Trial	A bench-scale treatment trial was completed by Enviropacific (2022) on soils collected from the FTG and FOT to confirm the suitability of the adopted remediation strategy. This successful trial demonstrated the effectiveness of the adopted chemical stabilisation method, including the nominated application rate of PAC of 0.5% v/v, with a 100% reduction in leachable concentrations of PFHxS + PFOS following treatment. These results were repeated following a 240-hour multiple extraction procedure (MEP) providing evidence of the long-term efficacy of treatment. A copy of the treatment trial report is provided in **Appendix P**.
Remediation Methodology	Remediation of accessible soils exceeding the soil remediation criteria of 0.04 mg/kg was completed as follows: • Impacted material was excavated in discrete lots (up to 250 m^3) and transported to the treatment area under EPS's Inspection and Test Report (ITR) system.

	• Testing of each 250 m^3 stockpile was completed to determine the pre-treatment leachability. • Excavated material was treated through the application of PAC at a nominal rate of 0.5% v/v using high-shear mixing (pug mill) and bucket mixing (for soil beneath the FTG bund) to ensure adequate mixing of material. • A nominal application of 2% v/v of bentonite was added to the soils to further reduce soil permeability. • Following treatment, material was stockpiled and validated in 100 m^3 lots through laboratory analysis to confirm the reduction in leachable PFAS concentrations. • Where leachable concentrations report a >95% reduction, material was deemed to have been successfully treated. • Prior to reinstatement, a guard layer of 20kg PAC per 100 m^2 was applied to the excavation base. • Following treatment, validated material was reinstated within the excavation and compacted in discreet 0.3m layers to a 95% compaction under level 1 geotechnical supervision. • Backfilled excavations were profiled to pre-existing landform and revegetated with shallow rooted perennial Couch or Rhodes grass.
FTG Concrete Bund	Remediation of the concrete bund located within the FTG was initially completed through application of Xypex Megamix I and Xypex X55 to permanently seal the concrete and prevent potential leaching of PFAS from the existing concrete surfaces. Monitoring of accumulated rainfall captured in the bund reported elevated concentrations of PFAS, indicating that the treatment was unsuccessful in meeting the remediation objective. On this basis, concrete material comprising the FTG bund was excavated and disposed to a licenced facility, with remediation of soils located beneath the concrete bund conducted in accordance with the remediation methodology adopted for remaining areas. A total of 153.02 tonnes of concrete material was disposed to BMI's Stapylton Resource Recovery facility on 22 August 2023. Based on an average total PFAS concentration in concrete of 0.6 mg/kg, the total mass of PFAS removed from the site in concrete is estimated to be approximately 0.1 kg.

12.1 Soil Remediation Validation Scope

To confirm that remediation was successfully completed, Epic undertook the following validation works during remediation:

- Excavation depths were assessed to confirm a suitable depth of material had been removed in accordance with the remediation plan
- Photographic evidence was collected of excavated surfaces
- Validation of treated soils to confirm material met the nominated validation criteria (>95% reduction in leachability). Validation of treated stockpiles at a rate of 1 sample per 10 primary validation samples collected by Enviropacific
- Collection of wall and base validation samples at a rate of 1:10 linear metres at each 0.5 m depth interval

12.2 Soil Remediation Validation Analytical Results

12.2.1 Treatment Validation Samples

Epic collected post treatment validation samples at a rate of 1 sample for every 10 validation samples collected by Enviropacific, to verify validation results. Enviropacific reported an average reduction in leachable concentrations of total PFAS of 99.72% in all validation samples. Of the three verification samples collected by Epic, a 99.71% average reduction in concentrations of leachable total PFAS was reported.

All samples reported a reduction in leachable PFAS >95%, with a summary of post treatment results presented in **Table 35**, with full results presented in **Table T10** and **Table T11**. Laboratory documentation is included in **Appendix Q.**

Table 35. Treatment Validation Verification Results

Enviropacific Untreated Sample ID	Eurofins - Sum of PFHxS & PFOS on ASLP Untreated (µg/L)	Enviropacific Treated Sample ID	Sum of PFHxS & PFOS on ASLP Treated (µg/L)	Epic Sample ID	Sum of PFHxS & PFOS (µg/L)	Reduction in leachability

12.2.2 Excavation Validation Results

A summary of the soil analytical results by validation excavation area are presented in **Table 36**, with full results presented in **Table T10** and **Table T11**. Laboratory documentation is included in **Appendix Q**. One of the remediation areas (Area 3) at the Fire Training Ground (FTG) reported concentrations below the adopted soil remediation criteria, with remaining areas reporting samples above the adopted soil remediation criteria.

It is noted that due to site constraints including existing roadways, structures and the site topography, remediation of target remediation areas was not able to be completed to remove all residual impacts.

Table 36. Summary of Soil Analytical Results for PFOS & PFHxS by Area (Site Remediation Criteria)

Validation Area	Min	Max	*Standard Deviation*	*Locations with exceedances*
Fuel Oil Tanks (FOT)				
Area 1	0.0043	1.86 (FOT-A1-V12-1.0)	0.42	All (except V03, V04, V06)
Area 2	0.0119	2.1 (FOT-A2-V5_1.0)	0.64	All
Area 3	0.0016	0.394 (FOT-A3-V09-0.5)	0.097	All (except V01, V02, V06, V07, V08, V011, V012, V013, V017)
Area 4	0.0076	0.659 (FOT-A4-V01-0.5)	0.23	All (except V02, V06)
Fire Training Ground (FTG)				
Area 1	0.0037	0.32 (FTG-A1-V1_1.0)	0.10	All (except V2, V4, V6, V7)
Area 2	0.0003	0.274 (FTG-A2-B4)	0.062	V4C, B4, B4A, V6, V7
Area 3	0.0036	0.0326	0.011	None

Note: Highlighted cells exceed the adopted soil remediation criteria of 0.04 mg/kg for the sum of PFOS and PFHxS

12.3 Soil Remediation Discussion

Based on the proposed remediation scope, and in consideration of limitations associated with existing site infrastructure and features that prevented full remediation of areas, the remediation and validation of PFAS impacted soils at the FOT and FTG is considered to have been completed successfully to meet the remediation objectives. A total of 2,302 m^3 of soil from the FOT and 852 m^3 from the FTG was treated, equating to the

stabilisation of approximately 1.3 kg of PFAS[10] as shown in **Table 37**. Following treatment, soils reported a reduction in the leachability of PFAS of >99.7%.

Table 37. Estimated Mass of PFAS Chemically Stabilised

Aspect	FTG	FOT Area 1	FOT Area 2	FOT Area 3	FOT Area 4	Total
Volume treated (m^3)	825	764	401	1,058	79	3,127
Tonnes treated soil (1.5 t/m^3)	1,237.50	1,146.00	601.50	1,587.00	118.50	4,690.50
Pre-treatment ASLP (average Sum of PFOS and PFHxS) (µg/L)	0.1450	34.1725	24.9667	4.1733	18.76	-
Pre-treatment ASLP (average Total PFAS) (µg/L)	0.2500	36.03	26.1333	4.5200	22.72	-
Predicted concentration – Sum of PFOS and PFHxS (mg/kg)	0.0213	0.06382	0.047036	0.09127	0.35721	-
Predicted concentration – Total PFAS (mg/kg)	0.02638	0.67207	0.49163	0.09759	0.4294	-
Total Mass – Sum of PFOS and PFHxS (kg)	0.02636	0.73138	0.28292	0.14484	0.04233	1.22784
Total Mass – Total PFAS (kg)	**0.03265**	**0.77019**	**0.29572**	**0.15487**	**0.05088**	**1.30431**

Note: Predicted concentrations based on correlation of total and leachate results (refer **Figure 27** and **Figure 28**)

Residual soil impacts remain at both the FOT and FTG, with a number of wall and base validation samples reported to exceed the remediation criteria of 0.04 mg/kg. Residual impacts were generally reported in wall validation samples representing material extending to existing site infrastructure including below roadways, service easements and retaining walls, with material considered to be capped through the reinstatement and compaction of excavated material. It is noted that surrounding areas not included in the remediation works also reported low concentrations of PFAS. Remediation at these locations was dictated by the practicalities of remediating around in-service infrastructure. However, it is anticipated that the remediation conducted will slow the horizontal and vertical movement of PFAS from surrounding material.

Based on the results of remediation and validation works, it is recommended that the results of remediation and validation works, along with previous investigation of the surrounding area be used to inform the ongoing, and future management of soils at the FOT and FTG. In addition, the FOT and FTG should be incorporated into CS Energy's Site Permit to Work (PTW) and Penetration Permitting systems to identify residual soil impacts and ensure appropriate management of potentially PFAS-impacted soils and wastes generated during future ground disturbance activities. Following decommissioning and removal of existing infrastructure additional remediation should be completed to manage residual PFAS impacts.

[10] The Initial CLID (Epic, 2022c) notes that the residual mass of PFAS at the fire training ground and fuel oil tanks at Callide B and C Stations was estimated to be approximately 4.8 kg. Review of these calculations based on the results of the soil remediation program indicates the residual mass of PFAS at the FTG and FOT is likely to be between 3 to 4 kg, with approximately 1.3 kg considered to be successfully stabilised, and 0.1 kg removed (equating to approximately 35 to 47 % of the estimated mass), and the remaining PFAS mass between 1.7 to 2.7 kg.

13 GROUNDWATER AND SURFACE WATER MONITORING (QUARTERLY)

Quarterly groundwater and surface monitoring was completed in October/November 2022, and January/February 2023, March 2023, June 2023, September 2023 and December 2023 in accordance with the Addendum SAQP (Epic, 2023a) and as detailed in **Table 8** (**Section 5.1**). Quarterly monitoring results are presented in **Table T1**, **Table T2** and **Table T3**, with monitoring locations presented on **Figure F2** (groundwater) **Figure F3** (surface water). Laboratory results are included in **Appendix K**.

13.1 Groundwater Standing Water Levels

Groundwater flow across the site is generally consistent with topography, with groundwater generally flowing from the northeast boundary down to the southwestern boundary of the site. Localised variations in groundwater elevation are observed onsite with the following notable influences present on, and immediately surrounding the site:

- The water stored within the evaporation ponds is believed to have previously infiltrated into the underlying weathered bedrock aquifer. Historically, seepage from some of the evaporation ponds discharged into the WSDC and Ash Dam B, however subsequent filling of the A Zone evaporation ponds with ash is believed to have significantly reduced water infiltration and subsequently, seepage
- When fully operational, the eastern seepage recovery groundwater bores installed within the bedrock aquifer effectively draw down the water table creating an effective capture zone reducing groundwater migration offsite (refer Figure F6)
- Seepage occurs in areas south (southern seepage), southeast (eastern seepage) and southwest (western seepage) of Ash Dam B, with some potential limited seepage migrating beneath the collection trenches
- The water levels (and volume of ash) within Ash Dam B have a direct influence upon water levels in southern portions of the site, with artesian conditions observed in areas surrounding MW44 when dam levels are elevated, and reduced seepage observed when water levels are reduced

Groundwater within the Callide Creek alluvium typically flows east to west turning slightly northwest beyond Jambin-Dakenba Road (joining with alluvium along Kroombit Creek). The groundwater levels within the aquifer are generally observed to remain below ground level through the investigation area, indicating that the aquifer discharges at a lower elevation (outside the Callide Aquifer investigation area) and that groundwater flows down-valley towards this discharge point.

Monitoring of groundwater levels during the current period (October 2022 to December 2023) report groundwater levels are generally consistent with historical monitoring results, with the following exceptions:

- Monitoring wells ESC3, MW42 and MW43 report fluctuations in reported groundwater levels throughout the monitoring period, and/or compared to historical results. These wells are located within the seepage recovery area capture zone and the fluctuation in groundwater levels are likely to be associated with seepage recovery activities
- Monitoring wells MW69, MW70, MW72 and MW73, located downstream of the site adjacent to Callide Creek report reducing water levels through the monitoring period. It is likely that the reduction in water levels is associated with regional depletion of the Callide Creek alluvial aquifer following cessation of water releases from Callide Dam
- Some fluctuation is observed in monitoring wells MW79 and MW80, located within Callide Creek adjacent to the site. These wells are likely to be directly influenced by water levels/flow within Callide Creek adjacent to the site, with fluctuations associated with inflows from rainfall events
- Some variability is observed across the two monitoring events completed for new monitoring wells MW89, MW90 and MW91. These wells are located within the eastern seepage area capture zone, and variability may be associated with seepage recovery activities, however limited data is available for these locations

13.2 Quarterly Monitoring Analytical Results

Groundwater and surface water analytical results are presented in **Table T2** and **Table T3**, with a summary of results presented in **Table 38** (quarterly monitoring) and **Table 39** (event-based monitoring). Groundwater and

surface water monitoring was completed in accordance with the Addendum SAQP (Epic, 2023a) at locations detailed in **Table 8** (**Section 5.1**).

Table 38. Groundwater and Surface Water Monitoring Results Summary

Investigation Area	Monitoring Wells	Identified Risk/Target	Analytical Results
Northern Boundary	MW74 SW06 SW33 SW34 SW45 BS3-CWN BS3-CWE BS30-CW	Potential impacts from offsite sources. Background monitoring location to assess hydraulically upgradient groundwater entering the site and upgradient surface water entering the site and leaving the site via the WSDC	Surface water results for samples collected along the northern site boundary generally report PFAS concentrations comparable to historical monitoring events, with PFAS detected in all four watercourses entering the site along the northern site boundary. Results from the current investigation support previous findings that high concentrations of PFAS are entering the site via the watercourses along the northern site boundary, with PFAS concentrations observed to decrease as surface water travels along the northern and western stormwater diversion channels. Further discussion of surface water results is presented in **Table 29** (**Section 10.2**), with statistical analysis presented in **Table 30**. Groundwater monitoring results for MW74 report an increase in total PFAS concentrations. The increase is attributed to increases in PFHxS, PCA compounds (PFBA, PFPeA, PFHxA, PFHpA, PFOA and PFNA) and 6:2 FTS, with PFOS concentrations remaining stable across all monitoring events. Further discussion of groundwater and surface water interaction along the northern site boundary is presented in **Section 10.3**.
Eastern Seepage Area	ESC3 ESC4 MW31 MW32 MW33 MW42 MW43 MW81 MW82 MW83 MW84 MW85 MW89 MW90 MW91 MW94	Potential migration of impacts from Ash Dam B via seepage to the eastern seepage collection area and offsite.	Groundwater results for the eastern seepage area support the presence of two seepage pathways, one associated with the current seepage pathway and seepage recovery system (ESC3, ESC4, ESC5, ESC6, MW42, MW52, MW61, MW83 and MW85), and an additional longer pathway associated with fractured rock roughly following a flow path connecting MW84, MW32 and MW43. Further discussion on groundwater results from the Eastern Seepage Area are presented in **Table 23** (**Section 8.2**).

Investigation Area	Monitoring Wells	Identified Risk/Target	Analytical Results
Southern Seepage Area	MW09 MW78 MW86	Potential migration of impacts from Ash Dam B via seepage to the southern seepage collection area and offsite.	Groundwater results for the southern seepage area report PFAS concentrations comparable to historical monitoring events and support previous findings presented in the Initial CLID (Epic, 2022c). Monitoring well MW86, installed between the southern and western seepage areas was reported to be dry, supporting that there is likely to be minimal seepage between these known seepage areas.
Western Seepage Area	MW40 MW49 MW56 MW68 MW98 SW13	Potential migration of impacts from Ash Dam B via seepage to the western seepage collection area and offsite.	Groundwater results for the western seepage area report PFAS concentrations comparable to historical monitoring events and support previous findings presented in the EE CLID (Epic, 2022c). New groundwater monitoring well MW98, installed immediately east of MW49, reported the lowest PFAS concentrations within the western seepage area bores (total PFAS 0.106 to 0.163 µg/L), with concentrations of PFOS (0.040 to 0.0647 µg/L) and the sum of PFOS and PFHxS (0.094 to 0.150 µg/L) reported above the 99% Species Protection limit and Drinking Water Criteria respectively. Groundwater was not reported to be encountered during drilling (GHD, 2023 – refer **Section 14.1**), with development reporting a low recovery yield (~0.05 L/s) and aquifer testing reporting a low hydraulic conductivity (0.00036 – 0.00088 m/day), indicating that MW98 may represent the lateral extent of seepage associated with the western seepage area. Surface water at SW13, located within the western seepage trench, reported increases in PFAS concentrations during the February 2023 and December 2023 monitoring event, with concentrations of PFOS (0.281 µg/L and 0.148 µg/L respectively) reported above the 95% species protection limit above the historical maximum (0.103 µg/L, Jan22). Concentrations of the sum of PFOS and PFHxS (0.555 µg/L and 0.311 µg/L) and total PFAS (0.678 µg/L and 0.401 µg/L) were also reported above historical maximums of 0.258 µg/L (Jan22) and 0.342 µg/L respectively. As reported in the Initial CLID (Epic, 2022c), water collected within the western seepage trench and pond is extracted from the western seepage pond (at SW03) and pumped back into ADB

Investigation Area	Monitoring Wells	Identified Risk/Target	Analytical Results
Callide Creek	MW69 MW70 MW72 MW73 MW79 MW80 SW02 SW12 SW22 SW40 SW41	Offsite impacts and migration downstream	Groundwater results for monitoring wells along Callide Creek generally report PFAS concentrations comparable to historical monitoring events and support previous findings presented in the EE CLID (Epic, 2022c). The exception is MW80 which reported highest concentrations during March 2023, with the sum of PFOS and PFHxS (0.115 µg/L) reported above the Drinking Water Criteria and the historical maximum of 0.0269 µg/L (May 2021). Results were reported within the historical range in June 2023, but were elevated against the historical range in September 2023 (0.0551 µg/L) and December 2023 (0.0696 µg/L). Results for groundwater monitoring wells within the Callide Creek Alluvium indicate that concentrations of PFAS downstream of the site are generally stable overtime as shown on **Figure F12**, noting some variability in concentrations at some locations (i.e. MW73). Surface water at SW12 (adjacent to site) reported concentrations of PFAS above historical ranges during the current monitoring period. PFOS (0.0106 µg/L, Feb23 and 0.0181 µg/L, Dec23) was reported above the historical maximum of 0.0058 µg/L (Nov21), and the Sum of PFOS and PFHxS (0.0721 µg/L, Feb23 and 0.0775 µg/L, Dec23) was reported above the historical maximum of 0.0234 µg/L (Nov21). Surface water at SW40 (Jambin Dakenba Road) reported elevated concentrations of PFAS during the October 2022 monitoring event, consistent with the July 2022 results, with results reported within the historical range during the July 2023 monitoring event.
Callide Alluvium	L005-B01 L006-B05 L012-B01 L021-B01 RN13030692 RN13030697 RN13030126 RN13030698 RN13030112 RN13030127[†] RN13030715[†]	Offsite impacts and migration to hydraulically downgradient areas	
Callide Dam	SW20 SW36	Background monitoring location to assess PFAS impacts in Callide Dam along with potential impacts via Dunn Creek.	Surface water results from Callide Dam reported PFAS detections in October 2022 (SW36), February 2023 (SW20 and SW36), June 2023 (SW20 and SW36) and December 2023 (SW20), with detections including PFBS (SW20 and SW36), MeFOSAA and EtFOSSA (SW36) and 6:2 FTS (SW20). Previous detections of MEFOSAA and EtFOSSA have only been reported in MW74 (MeFOSAA only, northern boundary) on two occasions and PW1 (ADB impoundment) on one occasion.

Investigation Area	Monitoring Wells	Identified Risk/Target	Analytical Results
Callide A / Dunn Creek	MW96 MW97 SW17+ SW18+ SW42+ SW43 SW44 R2+	Potential migration of impacts from Callide A via surface water.	Surface water results for Callide A and Dunn Creek report PFAS concentrations comparable to historical monitoring events and support previous findings presented in the EE CLID (Epic, 2022c). Comparison of results for surface water at SW44 (NSP), R2 and groundwater at MW97 indicate that a potential linkage may exist between surface water and seepage, and surface water/seepage and groundwater, with further discussion presented in **Section 7.3**.
Onsite Water Bodies	DRD PW2	Existing surface water monitoring locations within ADB catchment area.	Surface water results for onsite water bodies including the DRD and ADB (PW2) report PFAS concentrations comparable to historical monitoring events and support previous findings presented in the EE CLID (Epic, 2022c). Concentrations of PFAS within ADB at PW2 reported PFAS concentrations within historical ranges, however three of the monitoring events (February, September and December 2023) reported concentrations of the sum of PFOS and PFHxS (0.0931 µg/L to 0.117 µg/L) above the Drinking Water Criteria, with only one previous monitoring event (0.0948 µg/L, April 2022) reporting concentrations above the Drinking Water Criteria

Notes: + Samples were collected as part of event based or ad hoc sampling events when water was present at the sampling location

Table 39. Event Based Sampling Events

Date	Approximate Rainfall	Monitoring Wells	Investigation Area	Analytical Results
1 December 2022	10.2 mm (30Nov22) 30.4 mm (29Nov22)	SW28 SW33 SW34 SW35 BS3 CW BS3 SWN	Northern and Western Stormwater (potential impacts from offsite sources)	• All samples reported concentrations of PFAS above the laboratory's LOR, with highest concentrations of total PFAS reported in BS3 CWN (2.030 µg/L) and SW34 (1.32 µg/L) along the northern site boundary. Concentrations of PFAS reduced along the stormwater channels, with SW35 and SW28 located in the southern portion of the site reporting highest concentrations during the period of total PFAS of 0.319 µg/L and 0.368 µg/L respectively. Samples SW34, BS3 CW and BS3 CWN (upstream) and SW35 and SW28 (downstream) reported detections of similar PFAS compounds, including PSA and PCA compounds plus 6:2 FTS. • All samples reported concentrations of PFOS above the 99% Species Protection limit, with BS3 CWN reporting concentrations (0.301 µg/L) above the 95% Species Protection limit.

Date	Approximate Rainfall	Monitoring Wells	Investigation Area	Analytical Results
				• Samples SW34, BS3 CW and BS3 CWN reported concentrations of the sum of PFOS and PFHxS (0.180 µg/L, 0.183 µg/L and 0.595 µg/L respectively) above the Drinking Water Criteria
		SW42 SW43 SW44 R2	Dunn Creek (potential migration from primary source areas and residual impacts (Callide A) and potential impacts from offsite sources)	• All samples reported concentrations of PFAS above the laboratory's LOR, with highest concentrations reported at R2 (total PFAS 0.120 µg/L). • All samples reported concentrations of PFOS above the 99% Species Protection limit.
5 January 2023	46.8 mm	SW28 SW33 SW34 SW35 BS3 CW	Northern and Western Stormwater (potential impacts from offsite sources)	• All samples reported concentrations of PFAS above the laboratory's LOR, with highest concentrations of total PFAS reported in SW34 (2.19 µg/L) along the northern site boundary. Concentrations of PFAS reduced along the stormwater channels, with SW35 and SW28 located in the southern portion of the site reporting concentrations of total PFAS of 0.134 µg/L and 0.156 µg/L respectively. • All samples reported concentrations of PFOS above the 99% Species Protection limit (noting raised LORs for SW33 and SW35), with SW34 and BS3 CW reporting concentrations above the 95% Species Protection limit. • SW34 and BS3 CW reported concentrations of the sum of PFOS and PFHxS (0.309 µg/L and 0.354 µg/L respectively) above the Drinking Water Criteria
		SW42 SW43 SW44 R2	Dunn Creek (potential migration from primary source areas and residual impacts (Callide A) and potential impacts from offsite sources)	• All samples reported concentrations of PFAS above the laboratory's LOR, with highest concentrations reported at R2 (total PFAS 0.0511 µg/L) and the NSP (SW44, total PFAS 0.0693 µg/L). • All samples reported concentrations of PFOS above the 99% Species Protection limit.

14 ADDITIONAL INVESTIGATIONS

As part of ongoing investigations completed at the site, a number of additional investigation scopes were completed to inform the nature and extent of PFAS, along with ongoing management of the site. Details on additional investigations are presented in **Table 40**, with further information presented in the sections below.

Table 40. Summary of Additional Investigation Scopes

Investigation Area/Target	Investigation Scope	Summary of Investigation Works
Seepage Areas (ADB)	Geophysical resistivity survey	Fender Geophysics completed a geophysical resistivity survey of current seepage areas and surrounding areas to map known and potentially unknown seepage pathways from the Callide B and C sites. The survey was completed using dipole-dipole electrical resistivity imaging (ERI) between 8 and 20 August 2022. Approximately 6700 m of resistivity lines were surveyed (Fender, 2022), on the western and southern sides of ADB and in off-site areas in the vicinity of bores MW43 and MW32. The survey identified a number of areas of potential water-bearing zones, which informed a groundwater bore drilling program to improve the level of understanding of seepage areas and PFAS distribution, and supplement the existing monitoring and recovery network. A summary of works completed in the eastern and western seepage areas is included in **Table 21** and **Table 24** respectively, with a copy of the geophysical resistivity survey report included as **Appendix N**.
	Groundwater Bore Drilling	Based on the findings of the geophysical survey, and in consultation with CS Energy's consultant hydrogeologist, a total of 11 groundwater bore sites (MW81 to MW86, MW89 to MW91, MW94 and MW98) were established by GHD to further investigate the eastern and western seepage areas and supplement the ongoing groundwater monitoring program. The scope of work completed included: • Drilling of 11 boreholes at the nominated locations • Soil sampling from each borehole, including collection of samples from the shallow sub-surface, the water bearing unit and a composite sample of drill cuttings • Conversion of 6 bores into groundwater monitoring wells • Conversion of 5 bores into groundwater recovery wells • Completion of aquifer testing of wells, including slug and pump testing of selected wells • Sampling of each well for PFAS Proposed bores MW87, MW88, MW92 and MW93 were unable to be drilled due to access constraints, noting that MW98 was installed as an alternate location to proposed MW93. Following installation, bores were sampled by GHD in August 2023, with bores sampled by Epic as part of the September and December 2023 quarterly monitoring events. Monitoring well MW86 was dry during sampling events and as such no samples were collected at this location. A summary of works completed in the eastern and western seepage areas are included in **Table 21** and **Table 24** respectively, with a copy of the geophysical resistivity survey report included as **Appendix N**. Further details are presented in **Section 14.1**.
	Interpretative hydrogeological review of additional seepage investigations	Environmental Management Strategies completed an interpretative hydrogeological review of groundwater results following completion of the geophysical resistivity survey and groundwater bore drilling scopes, which included updating the preliminary CSM associated with groundwater seepage from ADB. A summary of the EMS report is presented in **Section 14.1.1**.

Investigation Area/Target	Investigation Scope	Summary of Investigation Works
Eastern Diversion Channel (EDC)	Sediment sampling along the EDC	Sediment sampling was completed along the EDC to assess potential localised sources of PFAS which may be contributing to elevated PFAS reported in groundwater at MW84. The EDC diverts surface water from areas south of the FOT around the ADB spillway. Four sediment samples (EDC-SED-4 to EDC-SED-7) were collected along the length of the EDC. Further details are presented in **Section 14.3**.

14.1 Bore Drilling and Well Installation (GHD, 2023)

GHD were commissioned to undertake a targeted drilling and monitoring bore installation program to further characterise the potential source and extent of PFAS contamination at the site. Investigation findings are presented in the following reports, with copies of each report included in **Appendix O**:

- GHD (2023a), Factual Bore Completion Report, Callide Groundwater Bore Drilling Project, 6 October 2023
- GHD (2023b), Soil Sampling Report, Callide Groundwater Bore Drilling Project, 6 October 2023
- GHD (2023c), Groundwater Sampling Report, Callide Groundwater Bore Drilling Project, 6 October 2023

A summary of the key findings of the reports is provided in **Table 41**.

Table 41. Document Review: GHD Bore Drilling and Well Installation (GHD, 2023a, b & c)

Document Titles	• Factual Bore Completion Report, Callide Groundwater Bore Drilling Project, 6 October 2023 (GHD, 2023a) • Soil Sampling Report, Callide Groundwater Bore Drilling Project, 6 October 2023 (GHD, 2023b) • Groundwater Sampling Report, Callide Groundwater Bore Drilling Project, 6 October 2023 (GHD, 2023c)
Prepared By	GHD
Prepared For	CS Energy
Investigation Site/Area	Callide Power Station and surrounds (Cocups Road road corridor)
Date	6 October 2023
Objectives	
Implement a targeted drilling and bore installation program prepared by CS Energy (the Callide Groundwater Bore Drilling Project) to fulfill the requirements of the Amended EE and to further characterise the potential source and extent of PFAS contamination likely to be caused from the storage and use of AFFF at the site.	
Scope	
• Drilling and installation of five recovery bores • Drilling and installation of six monitoring bores • Development of all 11 newly installed bores • Conducting pumping tests on five newly installed recovery bores and slug testing of five monitoring bores (one was dry) • Groundwater sampling and analysis of five new recovery bores, five new monitoring bores, and one existing monitoring bore. One new monitoring bore was not sampled as it was dry • Survey of newly installed wells • Soil and drill cuttings sampling and analysis. • Reporting	
Findings	
Bore Construction: Bores were drilled using air rotary techniques up to depths of 40 m. Recovery bores were drilled at a diameter of 205 mm and installed with 150 mm nominal diameter Class 9 µPVC casing and 6 m of screens whilst monitoring bores were fitted with 50 mm nominal diameter Class 18 µPVC casing and screens. Details on the bore construction is presented in **Table 42**. Bore locations are shown on **Figure F2**. A copy of GHD bore logs are included in **Appendix I** for reference.	

Table 42. Summary of Recovery and Monitoring Bores (GHD, 2023a)

Location area	Bore ID	Bore type	Screened aquifer unit	GDA94 MGA Zone 56		Natural surface elevation (m AHD)	Elevation of top of casing (m AHD)	Drilled depth (m BGL)	Screen interval (m BGL)	Date installed

Table notes:
Easting, Northing and elevations listed are from survey completed by Fredriksen, Maclean and Associates.
AHD – Australian Height Datum
BGL – Below ground level
GDA – Geodetic Datum of Australia
MGA – Map Grid of Australia

Water-bearing strata were present in andesite and andesitic breccia and tuff, with some bores (i.e. MW84) including sections logged as shale (this strata possibly comprises decomposed andesite as reported by EMS, 2024). All bores except MW89, reported groundwater to be under pressure (semi-confined) with the standing water level higher than the water intersection depth.

Aquifer Testing:
Slug testing (**Table 43**) and pump tests (**Table 44**) were completed on monitoring wells and recovery bores respectively, with results presented below.

Table 43. Summary of Slug Test Results (GHD, 2023a)

Bore ID	Screened geology	SWL (m bTOC)	Test type	Test No.	Maximum displacement (m)	Hydraulic conductivity (K) m/d	Analytical solution
MW84	Andesite	6.32	Falling head test	Test 1	0.7	2.6	Bouwer-Rice
			Rising head test	Test 1	1.1	3.6	Bouwer-Rice
			Falling head test	Test 2	0.8	3.7	Bouwer-Rice
			Rising head test	Test 2	1.3	3.6	Bouwer-Rice
MW89[1]	Shale	7.52	Rising head test	Test 1	0.5	0.2	Bouwer-Rice
MW91	Andesite	9.97	Falling head test	Test 1	0.45	7.7	Springer-Gelhar
			Rising head test	Test 1	0.7	7.7	Springer-Gelhar
MW94	Andesite / Tuff / Shale	9.53	Falling head test	Test 1	0.45	8.7	Bouwer-Rice
			Rising head test	Test 1	0.5	8.7	Bouwer-Rice
			Falling head test	Test 2	1.0	8.8	Bouwer-Rice
			Rising head test	Test 2	1.3	8.7	Bouwer-Rice
MW98[2]	Shale	9.45	Falling head test	Test 1	0.7	0.00046	Bouwer-Rice
			Falling head test	Test 2	0.6	0.00088	Bouwer-Rice
			Rising head test	Test 2	0.6	0.00036	Bouwer-Rice

Table notes:
1. Only the rising head test was analysed, as the screen was partially saturated.
2. Construction of the bore has the filter pack extending above the saturated zone, therefore the initial slug test data points show the response to the filter pack, which has been disregarded. The line has been fitted along the long-term recovery rather than the initial displacement response.

Table 44. Summary of Pumping Test Results (GHD, 2023a)

Bore ID	Test Type	Date start	Duration (min)	Flow rate (L/s)	Bores monitored	Radial distance[1] (m)	Drawdown (m)
MW81	Step	3/8/2023	60	0.6, 1.0, 1.5, 2.0	MW81	0.0	Three steps completed. 7.5 m drawdown in fourth flow rate step.
	Constant	4/8/2023	470	1.6	MW81	0.0	6.0
					MW82	73.2	No obvious drawdown
					MW84	76.9	No obvious drawdown
MW82	Step	5/8/2023	120	1.0, 1.5, 2.0, 2.5	MW82	0.0	Four flow rate steps completed for around 8.5 m drawdown.
	Constant	7/8/2023	600	2.4	MW82	0.0	8.4
					MW84	145.1	No obvious drawdown
MW83	Step	1/8/2023	120	0.2, 0.3	MW83	0.0	Drawdowns had yet to stabilise in the second flow rate step.
		3/8/2023	205	0.1, 0.2 and 0.3	MW83	0.0	Drawdowns had yet to stabilise in the third flow rate step.
	Constant	2/8/2023	215	1.5	MW83	0.0	7.6
					ESC1	55	No obvious drawdown
					MW85	108.4	Recovery response
MW85	Constant	8/8/2023	18	0.1	MW85	0.0	*Short duration
					ESC1	127.4	No obvious drawdown
					MW51	72.5	No obvious drawdown
					MW29	126.8	No obvious drawdown
					MW83	108.4	No obvious drawdown
MW90	Step	8/8/2023	55	0.2	MW90	0.0	Refer discussion below.
	Constant	10/8/2023	540	0.21 (300)[2] 0.3 (240)	MW90	0.0	4.0
					MW89	28	No obvious drawdown
					MW43	45	No obvious drawdown
					MW91	85	No obvious drawdown

Table note:
1. Radial distance from pumping bore.
2. Values in parenthesis represent duration of flow rate (min).

Soil Sampling:
Soil samples were collected from each bore at the following target depths/intervals:

- Shallow subsurface (between 0.1 m and 0.5 m)
- Deeper subsurface (between 0.35 m and 0.55 m)
- Water bearing unit (composite)
- Drill cuttings (composite)

All samples reported concentrations of PFAS below the laboratory's LOR and/or below the adopted assessment criteria (HIL-D and ecological direct and indirect exposure), with a summary of analytical results as follows:

- PFAS was reported in four of the 19 shallow and deeper subsurface samples, with total PFAS concentrations ranging from 0.0006 mg/kg to 0.0071 mg/kg. Samples reported detections of PFBS, PFHxS, PFOS, PFPeA and PFHxA. TOPA results for the same samples reported total PFAS concentrations ranging from 0.0003 mg/kg to 0.0095 mg/kg
- PFAS was reported in one of the 11 drill cutting composite samples (MW84_DC_0.0-39.0), with a total PFAS concentration of 0.011 mg/kg and detections of PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFHxA, PFOA. TOPA results for the same sample reported a total PFAS concentration of 0.0096 mg/kg

Groundwater Sampling:
Groundwater sampling was completed on new monitoring and recovery bores, with results discussed in **Section 8**, **Section 9** and **Section 13**. Groundwater results are presented in **Table T2**.

Limitations
All three reports (GHD, 2023a, b & c) comprise factual reports in line with the relevant scope, with the following report limitations noted: • The reports have been prepared by GHD Pty Ltd (GHD) for CS Energy Limited (CSE) for the purpose of responding to a notice to conduct an environmental evaluation issued by the administering authority pursuant to section 326B of the Environmental Protection Act 1994 (Qld) (EP Act) (the Purpose), and not for any other purpose. The report may be used by Queensland Department of Environment and Science (DES), acting in its capacity as the administering authority (as defined in the EP Act)), and the appointed contaminated land auditor, and Luke Amies (Suitably Qualified Person) for the Purpose. • GHD has prepared this report on the basis of information provided by CSE and others who provided information to GHD (including Government authorities and analytical laboratories), which GHD has not independently verified or checked beyond the agreed scope of work. Where drill hole logs, laboratory tests and similar work have been performed and recorded by others the data is included and used in the form provided by others

14.1.1 Data Reliability and Review

Complete reports were provided to Epic for review, noting that consultant report limitations permit the use of reports for responding to the EE. Review of provided reports indicate that drilling and well installation, collection of soil and groundwater samples and aquifer testing were undertaken by appropriately trained field personnel in accordance with relevant guidelines and utilising calibrated field equipment and appropriate field QA/QC methods (as applicable). Analytical samples were analysed by laboratories accredited by the National Association of Testing Authorities employing appropriate analytical techniques.

It is noted that the installation, development and aquifer testing of groundwater monitoring and recovery bores was completed under the supervision of CS Energy's consultant hydrogeologist who confirmed well construction details based on the current hydrogeological/geological understanding of the site and conceptual understanding of seepage pathways. All groundwater monitoring and recovery bores were installed by licenced drillers in accordance with the Minimum Construction Requirements for Water Bores in Australia (4th edition) (refer bore installation report included in Appendix O) as required by EE Requirement 7(g).

On this basis, results of sampling undertaken at the site by GHD are considered suitable for interpretative use, with groundwater monitoring infrastructure considered suitable for ongoing monitoring of groundwater conditions at the site. It should be noted that review of the GHD report has identified the following limitations and considerations:

- GHD only completed one round of groundwater sampling in August 2023, with sampling limited to newly installed groundwater monitoring and recovery bores.
- Sampling methods adopted are generally comparable to methods completed as part of EE investigations, noting the following:
    - Groundwater monitoring wells were sampled using low-flow techniques following installation and development using a QED Sample Pro bladder pump with single use HDPE bladders and tubing.
    - Groundwater recovery bores were sampled during completion of aquifer pump testing using a submersible Grundfos pump.
    - Decontamination of sample pumps was completed between each location, with rinsate samples collected reporting PFAS concentrations below the laboratory's LOR.
- Groundwater samples reported raised LORs for a number of PFAS compounds due to matrix interference or the presence of high contaminant levels (i.e. MW84), noting PFOS was reported above the LOR in all samples.
- Soil samples included the collection of composite 'chip' samples from the full length of drill cuttings returned to the surface during rotary air drilling. A subsample from each 1.0 m depth interval was mixed in a stainless steel bowl to form the composite sample. It is noted that chip sampling was completed to inform waste disposal requirements, with limitations in the interpretation of chip samples existing due to the likely heterogeneity of the material forming the composite sample (i.e. varying quantities of different rock materials and sizes/amounts of cuttings). Shallow and deeper sub-surface samples were collected via

hand auger. The hand auger is reported to have been decontaminated between each sampling location, with rinsate samples collected reporting PFAS concentrations below the laboratory's LOR.

14.2 Interpretative Hydrogeological Review (EMS, 2024)

Environmental Management Strategies (EMS) was commissioned to undertake a review of results from the additional bore drilling and well installation program (refer **Section 14.1**) and ongoing groundwater monitoring (refer **Section 13**) and update the preliminary CSM associated with groundwater seepage from ADB (EMS, 2022). A summary of the report findings is provided in **Table 45**.

Table 45. Document Review – Callide P.S. PFAS Environmental Evaluation, Groundwater Investigation, January 2024 (EMS, 2024)

Document Title	Callide P.S. PFAS Environmental Evaluation, Groundwater Investigation, Callide PS, January 2024
Prepared By	Environmental Management Strategies
Prepared For	CS Energy
Investigation Site/Area	Callide Power Station
Date	February 2024
Objectives	
To present the interpretation and findings of PFAS groundwater investigations and associated sampling undertaken between June and August 2023 in the Eastern and Western Seepage areas of Callide Power Station and update the preliminary CSM associated with groundwater seepage from ADB (EMS, 2022).	
Findings	

A summary of key findings reported include:
 	
Eastern Seepage Area:
• Two specific zones of PFAS presence have been identified in groundwater at the eastern end of the ADB:
  • An inner (possibly older) more extensive zone with PFAS concentrations generally in the range 0.05 to 0.5 µg/L which is inferred to be sourced from ADB seepage, and
  • A more easterly higher concentration PFAS zone on the MW84-MW32-MW43 axis – inferred to be potentially sourced from the FOT or an unknown localised source.
• The elevated PFAS levels recorded at MW84 could be a result of:
  • surface drainage of PFAS from AFFF usage areas to ADB and subsequent seepage migration via fractured rock pathways in the spillway area in periodic pulses to the MW84 area;
  • long flowpath dissolved flow groundwater migration of PFAS in fractured rock from the Fuel Oil Tanks area to the ADB spillway area. This is discussed further below; or
  • the presence of a distinct PFAS source area at the ADB spillway area from possible local area usage of AFFF and infiltration to depth of dissolved PFAS;
• The PFAS plume on the MW84 – MW32 – MW43 flow path is continuing to migrate past MW43 but the main body of the PFAS plume does not appear to have reached Callide Creek.
  • This is supported by the mostly low levels of PFAS measured at sampling site SW12 in Callide Creek below the Callide Dam spillway and at alluvial bore MW80 at the Callide Creek Crossing.
  • Measurable levels of PFAS (above 0.03 µg/L) have and are expected to continue to be observed at sampling site SW12 during dry/low inflow periods of surface water/rainwater.
• PFAS travel times from MW32 to MW43, and MW43 to Callide Creek along the inferred seepage flowline as unattenuated solutes are estimated at 4.5 and 6.3 years respectively.
• Hydraulic testing of bores MW84 and MW91 suggest that those sites are suitable for installation of recovery bore infrastructure.
• Based on the test pumping data and the analysis undertaken by GHD, bores MW81 and MW82 are in suitable locations and would appear to have sufficient hydraulic capacity to produce 1 to 2.5 L/s, when ADB seepage is occurring.
• MW90 yielded 0.3 L/s on test pumping and is considered suitable for equipping as a low yield recovery bore, with operation similar to the existing low yield bores in the WSCP and Southern Seepage area.	

- Groundwater level data and PFAS concentrations from various monitoring bores in the Eastern Seepage Recovery Area support the inference of a groundwater capture zone which potentially includes bores ESC3, MW42, MW43, MW51, MW63 and MW65 (**Figure 29**)

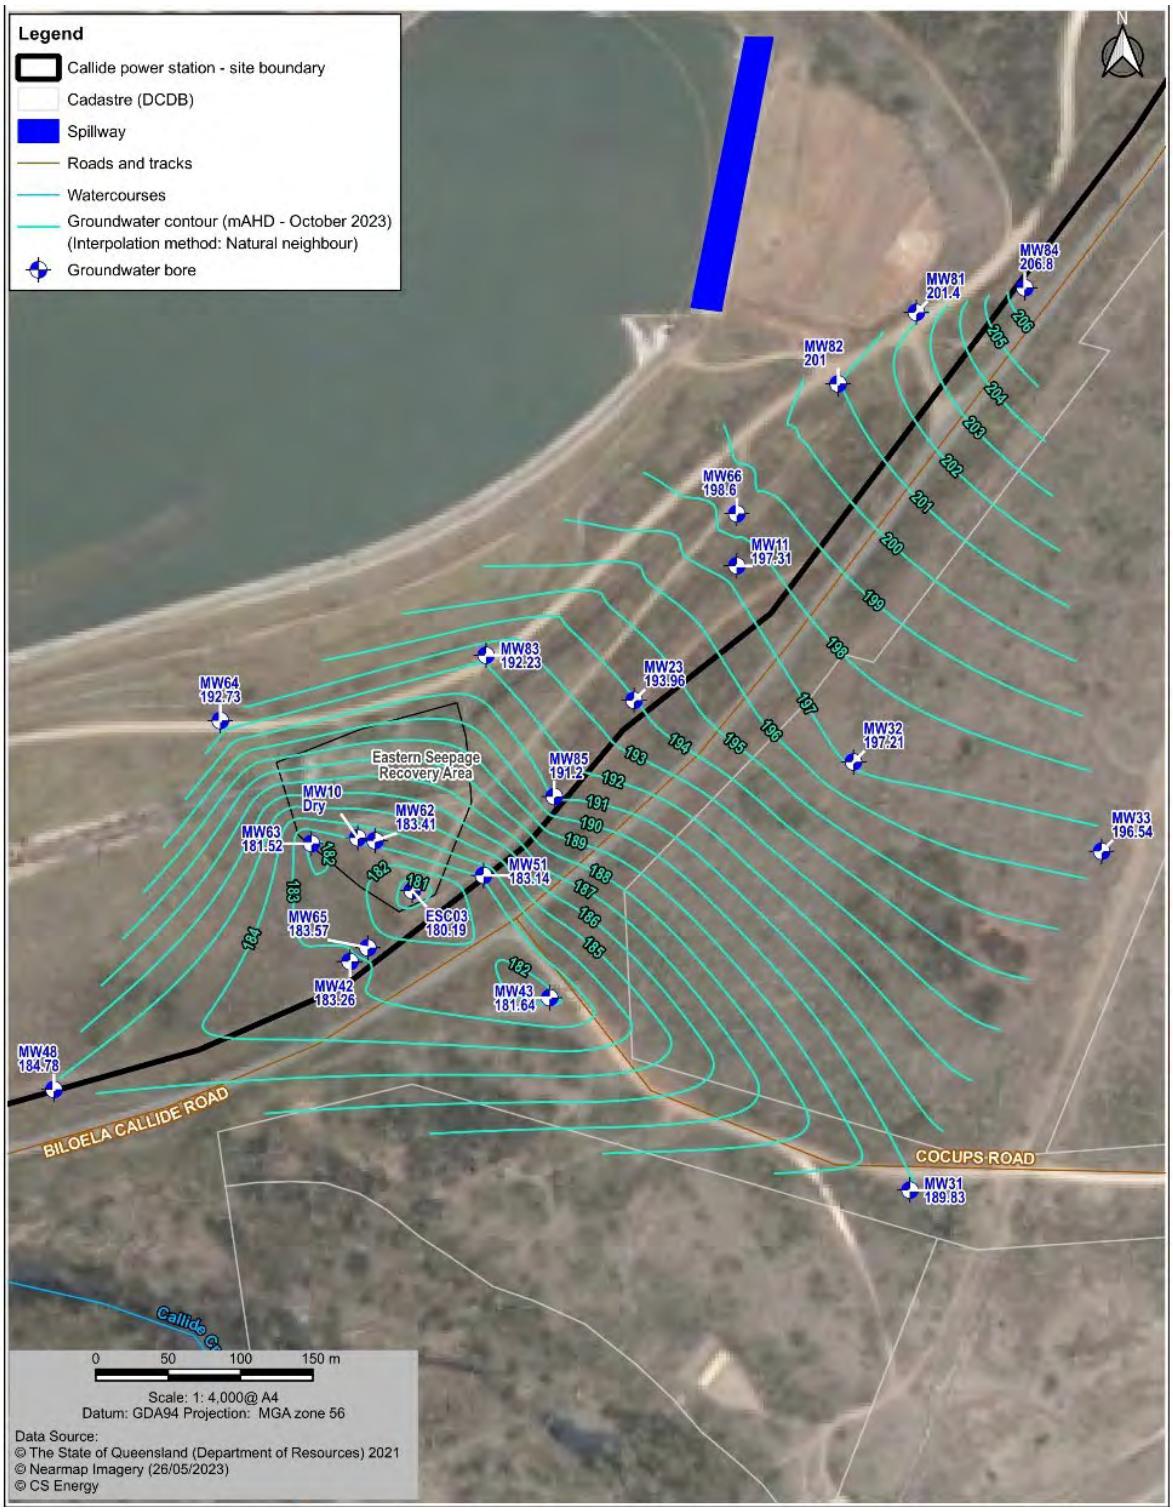

Figure 29. Eastern Seepage Area Groundwater Contours (October 2023) (EMS, 2024)

Western Seepage Area:

- MW86 was drilled on a geophysical target identified on the southern boundary. This bore was dry, which supports the premise that there is little seepage to Callide Creek from ADB between the Southern and Western Seepage Recovery Areas.
- Groundwater level data from various monitoring bores in the Western Seepage Recovery Area and PFAS data from bore MW68 indicates that groundwater flux continues to migrate off-site in the Western Seepage Recovery Area, in a southerly direction (**Figure 30**)

Figure 30. Western Seepage Area Groundwater Contours (August 2023) (EMS, 2024)

Groundwater Seepage:
Estimates of the flux of groundwater, groundwater recovery and residual (fugitive) seepage are summarised in **Table 46**.

Table 46. ADB Groundwater Flux and Recovery (EMS,2024)

Area	Groundwater Flux Estimate (m^3/week)	Groundwater Recovery Estimate (m^3/week)	Residual Seepage (m^3/week)	Percent Recovery
Eastern and Southern Seepage Areas	4,890	3,680	890[2] to 1,210[1]	75 to 80%
Other Southern ADB Fractured Rock	126	0	126	0%
Total Eastern and Southern Seepage	5,016	3,680	1,016 to 1,336	73 to 80%
Western Side of ADB[3]	721	539	182	75%
Total Seepage	**5,737**	**4,219**	**1,198 to 1,518**	**73 to 80%**

Notes: [1] Based on Darcy Equation
[2] Method of difference from mass balance
[3] Includes site western boundary

Recommendations

Based on the review of results from the additional bore drilling and well installation program undertaken by GHD, EMS made the following recommendations:

- Undertake further investigatory drilling to confirm whether or not the FOT area is the potential source area for PFAS at MW84 adjacent to the ADB spillway, and drilling in the ADB spillway area to improve the understanding of groundwater flow and solute transport in that area.
- Install seepage recovery equipment at bores MW81, MW82 and MW90.
- Install additional recovery bores in vicinity of MW84 and MW91.
- Test pumping of bore MW78 on the southern boundary and assess suitability as recovery bore. Install seepage recovery equipment at MW78 if it is suitable as a recovery bore.
- Install an additional monitoring bore at Western Seepage Recovery Area.
- Trial seepage recovery from bore MW49.
- Additional low yield recovery bore(s) on southern boundary Western Seepage Recovery Area.
- Additional monitoring bores on the site's western boundary.

Limitations

The following report limitations are noted (EMS, 2024):

- EMS has relied upon third party reports, data, observations, estimates, interpretations and publicly available information for the compilation of this report.
- This report does not encompass verification of the efficacy of data provided by third parties, or in particular, an audit of sampling or laboratory analytical procedures or protocols
- This report has not been prepared for use of parties other than the client, the owner and their respective consulting advisers and DES. It may not contain sufficient information, nor should it be relied upon, for the purposes of other parties or for other uses.
- To the best of our knowledge, information contained in this report is accurate at the date data was originally reported. However, conditions including climate, site activities, regional development and water usage and surface and groundwater quality can change, limiting use of the report over time.

14.3 Eastern Diversion Channel (EDC)

Sampling of sediments along the EDC was completed in accordance with sediment sampling methods detailed in the EE SAQP (Epic, 2022a) and included the collection of four samples (EDC-SED-4 to EDC-SED-7) of sediments accumulated within the channel. Samples were collected by hand, using a nitrile glove.

Sampling locations are shown on **Figure F6**, with a summary of analytical results presented in **Table 47**. Analytical results are presented in **Table T4** (sediment) and **Table T6** (leachate), with laboratory documentation provided in **Appendix K**.

Table 47. Eastern Diversion Channel Results Summary

Investigation Area/Target	Observations	Analytical Results
Potential PFAS impacts along the EDC	The majority of the EDC was dry at the time of sampling, with sediments comprising dry, brown gravelly sand with small to medium gravels. A small (~3 m) section of the EDC was observed to be moist to wet, and comprised a brown gravelly sandy clay with small gravels. Sample EDS-SED-6 was collected from this section.	**PFAS Results** • PFAS was detected in samples EDC-SED-4, EDC-SED-5 and EDC-SED-6, with highest concentrations reported in EDC-SED-6, located in the centre of the EDC. No PFAS was detected in the most upstream location (EDC-SED-7) • Samples EDC-SED-4 and EDC-SED-5 reported detections of PFOS, PFHxS and PFOA, with results reported below the respective soil investigation criteria • Sample EDC-SED-6 reported detections of PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA and PFOA, with concentrations of PFOS (0.230 mg/kg) reported above the ecological indirect exposure criteria of 0.01 mg/kg and the Sum of PFOS and PFHxS (0.295 mg/kg) reported above the HIL-A criteria of 0.01 mg/kg, but below the HIL-D criteria. **TOPA Analytical Results** TOPA analysis completed on sample EDC-SED-6 reported concentrations of PFAS generally comparable to the standard analysis results, with an overall reduction (-33%) in PFAS concentrations following oxidation, indicating that additional precursors are unlikely to be present. **TOF Analytical Results** TOF analysis completed on sample EDC-SED-6 reported concentrations below the laboratory's LOR of 1.0 mg/kg indicating additional fluorinated organic compounds are unlikely to be present. **ASLP Leachability Results** Australian Standard Leaching Protocol (ASLP) leachability analysis performed on EDC-SED-6 reported leachable concentrations of PFAS compounds detected in the standard analysis (PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA and PFOA). Leachable concentrations of PFOS (3.99 µg/L) were reported above the 95% Species Protection limit of 0.13 µg/L, with concentrations of the sum of PFOS and PFHxS (5.87 µg/L) reported above the Recreational Water criteria of 2.0 µg/L. Sample EDC-SED-6 reported a total PFAS leachate concentration of 6.98 µg/L.

14.3.1 Eastern Diversion Channel Discussion

Sediment results collected from the EDC reported elevated concentrations at the location of sample EDC-SED-6, which was collected from an area of moist to wet sediment within the alignment of the EDC. Concentrations of PFAS were also reported to be highly leachable, with leachability of PFOS and the sum of PFOS and PFHxS reported above the 99% and 95% Species Protection limits and the Drinking and Recreational Water Criteria respectively.

The nearest known PFAS source area is the FOT, located approximately 700 m north, with elevated PFAS compounds also reported in MW84, located approximately 225 m to the southeast. It's noted that the location of EDC-SED-6 is in close proximity to the location of the inferred geological fault line, with MW84 (southeast) and the FOT (north) also located near the inferred lineament (refer **Figure F6**).

It is noted that perfluoroalkyl sulfonic acid (PSA) compounds comprised the main functional group (~90%), with PFOS (~60%) the main compound by percent composition. Review of compositional data indicates similarities in the PFAS composition in sediment at EDC-SED-6 and soils at the FOT (refer Figure 45 in the Initial CLID (Epic, 2022c)) which reported PSA compounds as the main functional group (generally >80% by composition). Comparison with groundwater results from MW84 indicates a similar trend, with PSA compounds as the main functional group (>70%), however, PFOS was only reported to comprise approximately 20 to 30%. In addition, results from EDC-SED-6 with MW84 both report detection of the same PFAS compounds (PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFBA, PFPeA, PFHxA, PFHpA and PFOA).

15 REVISED CONCEPTUAL SITE MODEL

Following completion of the site investigation, a review of the CSM presented as part of the Initial CLID (Epic, 2022c) has been completed, with a summary of updated/revised CSM aspects discussed below. Further details on the CSM are included in the Initial CLID (Epic, 2022c), with CSM figures (updated where applicable based on the findings of this report) included in **Appendix E.**

Table 48. Revised CSM Aspects

CSM Aspect	Discussion/Comment
Groundwater	Results from surface water investigations have identified the following source-pathway linkages: • Groundwater results for background monitoring wells located along the northern (hydraulically upgradient) boundary indicate that groundwater located along the northern site boundary (as represented by MW01 and MW74) is likely to have been impacted from surface water entering the northern site boundary from the area of the mine and subsequently migrating to the underlying aquifer. Elevated concentrations of PFAS were reported in SW33, SW34, BS3 CW, BS3 CWN and SW45. An increasing trend in PFAS concentrations is observed in MW74. It is noted that based on the topography of areas north of the site, groundwater impacts may be localised to areas along the northern site boundary where surface water pools following flow events, with features including the railway line providing a constriction to surface water flows. • Groundwater results for the eastern seepage area support the presence of two seepage pathways, one associated with the current seepage pathway and seepage recovery system (ESC3, ESC4, ESC5, ESC6, MW42, MW52, MW61, MW83 and MW85), and an additional longer pathway associated with fractured rock roughly following a flow path connecting MW84, MW32 and MW43. • High concentrations of PFAS were reported in new groundwater monitoring well MW84, however it's not considered to change the current understanding of potential risk associated with the eastern seepage area, with results from existing monitoring wells MW32 and MW43 remaining stable over time, and PFAS concentrations reducing from north to south along the inferred MW84-MW32-MW43 seepage pathway. Southern portions of the inferred MW84-MW32-MW43 seepage pathway are located within the existing eastern seepage area recovery zone which is likely capturing some seepage from this pathway (as supported by water levels and variability in PFAS concentrations). • The nearest known PFAS source area to MW84 (with high PFAS concentrations) is the FOT, located approximately 900 m north. It's noted that MW84 and MW32 are located in close proximity to the location of an inferred geological fault line, which is inferred to continue to the north, with sediment in the eastern diversion channel, also located in proximity to the inferred geological fault line and approximately 225 m northwest of MW84, also reporting high concentrations of PFAS. • Fugitive seepage from the combined eastern/southern and western seepage areas is 145 - 190 m^3/day and from the western side of ADB 26 m^3/day (EMS, 2024), with >70% of seepage estimated to be recovered. • Groundwater results from the western seepage area reported comparable PFAS composition across all monitoring wells, with MW49 reporting a greater proportion of PFHxS and highest concentrations (approximately one order of magnitude higher than other wells). It is likely that surface water within the western stormwater diversion channel infiltrates through shallow alluvial soils in the southern portion of the site near MW55 and continuing to the site boundary. Current results indicate the elevated concentrations of PFAS measured in MW49 are unlikely to be caused by this infiltration. MW49 appears to be located outside of the current groundwater seepage capture area. New monitoring well MW98, located approximately 14 m east of MW49, may represent the lateral extent of seepage associated with the western seepage area. • Concentration of PFAS within the Callide Creek alluvium is reported to be variable, but present throughout the offsite investigation area, with PSAs

CSM Aspect	Discussion/Comment
	(including PFOS and PFHxS) comprising the dominant PFAS group. Detections of PCA and FSA compounds were generally limited to areas upstream of the Dawson Highway (closer to the site). In general, PFAS concentrations decrease with distance from the site, with the composition of PFAS also observed to change with distance from site (higher proportion of PFOS adjacent to the site, with PFHxS becoming the main compound approximately 5 km downstream). The results support the current CSM that the variability in PFAS concentrations is associated with a number of mechanisms including the variability of current and historical releases, variability of aquifer composition, surface water inflows from contaminated and uncontaminated areas, and recharging of the aquifer by surface water and releases from Callide Dam which are likely to dilute PFAS within central areas of the alluvium (along the alignment of Callide Creek).
Surface Water	Results from surface water investigations have identified the following source-pathway linkages: • PFAS is reported to be entering the site along the northern site boundary (via four main watercourses represented by SW33, SW34, BS3 CWE and BS3 CWN), with concentrations exceeding the 99% species protection limit (all samples) and the 95% species protection limit (PFOS, 0.13 µg/L) and the drinking water criteria (sum of PFOS and PFHxS, 0.07 µg/L) in SW34 and BS3 CWN. • Once surface water has entered the site it is observed to flow along the NSDC and WSDC and discharge to Callide Creek via SW28. Concentrations of PFAS at the point of discharge (SW28) from the WSDC are considerably lower than those at the northern site boundary, with concentrations of PFOS exceeding the 99% species protection limit. Sediment sampling along the Northern Stormwater Diversion Channel (NSDC) (refer below) indicate approximately 1.0 – 1.5 km of sediments within the NSDC, commencing at SW34 and continuing to between NSDC2 (1.0 km downstream from SW34) and NSDC3 (1.5 km downstream from SW34) has been impacted by PFAS contaminated surface water entering the site along the northern site boundary. • Concentrations of PFAS within the Western Seepage Collection Trench were observed to increase between Notch-V1 (top of seepage trench) and the western seepage collection pond (SW03) supporting the knowledge that the trench is intersecting shallow seepage from under the wall of ADB. The composition of PFAS within the trench was comparable to adjacent surface water bodies (i.e. Notch-V1 and the borrow pits and Notch-V2 and the western impoundment of ADB). Variability and high concentrations reported at SW03 are likely to be associated with inputs from the seepage trench (comprising seepage and rainwater) and recovered groundwater (from MW55, MW56, MW57 and MW58) pumped to the western seepage collection pond. • Surface water within the DRD, ADB impoundments and borrow pits are generally comparable in concentration and composition, noting some variance across monitoring events. Concentrations of PFAS in the borrow pits were observed to be higher, however no evidence of a separate source is observed, with lower concentrations reported in MW77 (adjacent to the borrow pits, hydraulically upgradient), and no PFAS reported in the ash filled evaporation ponds (dewatered) upgradient of the borrow pits. Monitoring results for water impounded within ADB (as represented by PW2) indicate concentrations may be increasing. • At Callide A, PFAS is reported to be present in Dunn Creek, with results indicating that a potential linkage may exist between surface water in the NSP (SW44) and seepage (represented by R2), and surface water/seepage and groundwater (represented by MW97). Detections of PFAS have also been reported at the mouth of Dunn Creek (SW36) during two monitoring events. Concentrations reported within Dunn Creek are likely to be associated with discharges from Callide A (via release point R2 and/or groundwater as represented by MW97) combined with upstream sources from the mine, noting limited water is released via R2, and during 2023 CS Energy pumped out the R2 sump to prevent releases via this pathway. Historically PFAS concentrations (SW18) have been higher

CSM Aspect	Discussion/Comment
	upstream of the site, noting that a mine dam (Dunn Creek Dam) is located adjacent to the north-eastern corner of the site. A localised PFAS impact is reported within accumulated sediments in the NSP, with PFAS reported in surface water (SW44), seepage (R2) and groundwater (MW97) likely associated with this localised impact.
Sediment	• Results from sediment investigation along the Northern Stormwater Diversion Channel (refer Epic, 2022c) indicate approximately 1.0 – 1.5 km of sediments within the NSDC, commencing at SW34 and continuing to between NSDC2 (1.0 km) and NSDC3 (1.5 km) has been impacted by PFAS contaminated surface water entering the site along the northern site boundary. Surface water monitoring (refer above) indicates impacted surface water flow along the NSDC and WSDC and discharge to Callide Creek via SW28, with lower concentrations observed at the point of discharge. High concentrations of PFAS have been reported coming onto site on the northern boundary in an adjacent watercourse represented by samples BS3 CWN and BS3 CW, with accumulated sediments along this pathway also likely to contain elevated PFAS concentrations (based on sampling completed along the NSDC). • Further investigation at Ash Dam 4 indicates that a localised source of PFAS (as represented by borehole AD01) is likely contributing to PFAS concentrations reported in sediments in the drainage line at Ash Dam 4 • Sediment sampling within the eastern diversion channel, located adjacent to the ADB spillway reported high concentrations of PFAS in one sample (EDC-SED-6), with PFAS concentrations also reported to be highly leachable. The nearest known PFAS source area is the FOT, located approximately 700 m north, with elevated PFAS compounds also reported in MW84, located approximately 225 m to the southeast. It's noted that the location of EDC-SED-6 is in close proximity to the location of the inferred geological fault line, with MW84 (southeast) and the FOT (north) also located along the inferred lineament.
Soils	Soil investigations completed as part of the EE CLID (Epic, 2022c) confirmed the FOT and FTG as primary PFAS source areas, associated with the historical use of AFFF at both locations. Remediation of the FOT and FTG has resulted in the stabilisation of approximately 1.3 kg of PFAS, with stabilised material reporting a reduction in the leachability of PFAS of >99.7%. A further approximately 0.1 kg of PFAS has been removed from the site in concrete material formerly forming the FTG bund. Residual soil impacts remain at both the FOT and FTG outside of the remediation areas, and will require ongoing management as part of site operations. The nature of the remediation should, however, slow any mobilisation of contaminants from these areas. Secondary source areas and residual impacts have been reported at the following areas: • The fire station is considered to be a secondary source area (refer Epic, 2022c). PFAS was detected in all samples, with concentrations reported below the adopted assessment criteria. Several PFAS compounds were detected which is likely to be associated with the different foam products historically utilised at the site. PFAS reported at the fire station is considered to be associated with residual impacts of cleaning and drying of fire equipment, and not associated with the release of AFFF. • Sampling completed of ash disposed within ADB reported concentrations below the adopted assessment criteria (HIL-D and ecological indirect exposure), with highest concentrations reported in saturated profiles, and unsaturated profiles generally reporting concentrations below the laboratory's LOR. Ash within ADB is considered to represent a residual source with low PFAS concentrations. • It is noted that a number of ash disposal areas, including Ash Dams 1 and 2 (Callide A) and the Evaporation Ponds ('A' ponds) reported concentrations of PFAS below the laboratory's LOR indicating significant PFAS impacts are unlikely to be present. • One of the samples collected at Ash Dam 4 (AD401-0.5) reported concentrations of PFAS above the ecological indirect criteria of 0.01 mg/kg and based on further investigations is likely to represent a localised area of impact.

CSM Aspect	Discussion/Comment
	• One location at Callide A (CA15) within the NSP reported concentrations of PFOS above the ecological indirect criteria of 0.01 mg/kg, representing layers of coal ash/dust approximately 1.0 m deep. Sampling at other locations within the NSP (CA17 to CA19) reported PFAS concentrations below the assessment criteria and/or the laboratory's LOR, indicating that impacts at CA15 are likely to be localised to the approximately 1.0 m layer of coal ash/dust at this location.
Aquatic Biota	Assessment of aquatic biota tissue contaminants, habitat condition, macroinvertebrate community and aquatic biota target sampling sites along Callide Creek and within Callide Dam and Kroombit Dam reported variability in habitat condition, aquatic biota, and macroinvertebrate communities, however habitat quality overall was in good to excellent condition with assessment at most sites limited due to lower water depth, availability of micro and macrohabitats and by fine substrate content. Impacts to habitat conditions and macroinvertebrate assemblages was reported to be associated with land use disturbances (i.e. agricultural land uses) and not considered to be influenced by the presence of PFAS. PFOS was detected in 15 of the 40 samples collected, with one also reporting detections of PFHxS, with all but one detection reported within Callide Creek downstream of the site. Results indicate bioaccumulation of PFAS is likely to be occurring, noting: • Four of the target human health species (three catfish species and one Yellowbelly) reported concentrations of PFOS exceeding the FSANZ trigger point criteria (FSANZ, 2017) for fish of 5.2 µg/kg for PFOS, with a maximum concentration of 44 µg/kg reported in sample AB5-PR-EP (Rendahl's Catfish). • Twelve target ecological species reported concentrations of PFOS exceeding the PFAS NEMP biota guideline value (for sum of PFOS and PFHxS) for mammalian diet (4.6 µg/kg), and nine of these samples also exceeding the guideline value for avian diet (8.2 µg/kg). All exceedances were reported in sampling locations within Callide Creek downstream of the site, with the highest concentration of 89 µg/kg was reported in sample AB8-AA-WB (Agassiz's Perchlet) within Callide Weir. Highest concentrations of PFOS in aquatic biota were generally associated with highest average surface water PFOS concentrations, with higher concentrations reported in samples collected furthest downstream of the site at the Callide Weir (refer **Figure 26**). It is noted that monitoring locations further downstream from the site (SW41, Callide Weir) comprised larger waterbodies and included the Callide Weir, which may also contribute to higher concentrations in aquatic biota due to the presence of more habitat to support biota and longer residence times due to greater availability of food sources. PFAS was not detected in any of the human health or ecological target species sampled from Callide or Kroombit Dams (including Barramundi and Red Claw Crayfish) indicating risks to human health associated with aquatic biota within Callide Dam is low. Based on results from aquatic biota samples, potential risk exists for: • Higher order organisms including mammals and birds due to exposure to PFAS via consumption of biota from Callide Creek • Human health due to exposure to PFAS via consumption of biota from Callide Creek

15.1 Review of Source-Pathway-Receptor Model

Based on the findings of the current investigation, source, pathway and receptor linkages identified as part of the EE CLID (Epic, 2022c) have been reviewed, with a summary detailed in **Table 49.** Key PFAS migration pathways and CSMs are included in **Appendix E**.

Table 49. Summary of Revised Pathway and Receptor Linkages

Source	Migration Pathways	Status	Receptor(s)	Considerations / Comments
Onsite Migration – Callide B and C Source Areas	**Onsite Surface Water** The primary onsite pathways for migration of PFAS from source areas at Callide B and C is via surface water flows through onsite drainage and overland flow to the DRD and ultimately to Ash Dam B (EMS 2022). Results indicate surface water within the DRD and ADB are generally comparable, however monitoring results for water impounded within ADB (as represented by PW2) may be increasing based on monitoring completed during 2023. Once within Ash Dam B, pathways for PFAS migration include: • Circulation within Ash Dam B via movement of surface water and operational water uses (i.e. dust suppression, ash watering) • Adsorb to ash, sediments and soils within Ash Dam B, although limited PFAS has been identified in ash disposal areas • Infiltrate to groundwater and discharge via deep seepage (approximately 75% recovered and returned to Ash Dam B) • Discharge via shallow seepage (collected as surface water in seepage collection trenches and returned to Ash Dam B) • Licenced stormwater discharges (occasional).	Complete	The receptors associated with the migration pathways in Callide B and C include: • Dermal contact, inhalation or ingestion exposure pathway to site workers operating in areas impacted by PFAS (soil or water) • Plant uptake associated with ecological receptors of current and future revegetated areas (including rehabilitated areas) • Exposure of migratory birds and other transient fauna interacting with the environs of the waste containment facility including the Western Stormwater Diversion Channel	• The risk to site users is considered low based upon the operational conditions and controls required for workers interacting with impacted soils and waters • The current high salinity of the major water bodies onsite (Ash Dam B and Borrow Pits A and B) is likely to preclude consumption or plant uptake pathways associated with ecological (flora and fauna receptors) • Ongoing monitoring proposed to be completed as per Recommendation 8 (refer **Section 16.3**)
	Eastern and Southern Seepage Areas (Groundwater) The estimates of total deeper seepage recovered and fugitive seepage from the eastern and southern seepage areas is 525 m^3/day and 145 - 190 m^3/day respectively (EMS 2024), equating to successful recovery of approximately 70 - 80% of deeper seepage. It is estimated that the mass of the sum of PFOS and PFHxS within water contained within Ash Dam B is between 0.15 kg to 0.6 kg (based on an average concentration of 0.05 µg/L), with the mass of PFAS in fugitive seepage (not recovered) currently estimated to be approximately 0.01 kg per year (EMS 2022). Although PFAS concentrations in MW84 (total PFAS 36.7 – 48.6 µg/L) are significantly higher than results reported as part of the EE CLID	Ongoing Investigation (Refer **Section 16.2**)		• Additional investigation required to assess potential risk and inform potential remediation and/or management of PFAS impacts on site (Refer **Section 16.2**) • Additional works proposed to be completed as per Recommendations 3 and 4 (refer **Section 16.3**)

Source	Migration Pathways	Status	Receptor(s)	Considerations / Comments
	(Epic, 2022c) (MW32 total PFAS 8.12 – 10.50 µg/L), it's not considered to change the current understanding of potential risk associated with the eastern seepage area, with results from existing monitoring wells MW32 and MW43 remaining stable over time. Results report concentrations of PFAS reduce between MW84 and MW32, and then further reduce between MW32 and MW43, with reduction in concentrations likely to continue between MW43 and the likely discharge point to Callide Creek, noting that MW43 and the surrounding monitoring wells are located within the eastern seepage area recovery zone (refer **Figure F6**), and concentrations of surface water in Callide Creek (as represented by SW12) are generally at or below the Drinking Water Criteria.			
	Western Seepage Area (Groundwater) The estimates of seepage recovered and fugitive seepage from the western seepage areas is 77 m^3/day and 26 m^3/day (EMS, 2024), equating to successful recovery of >70% of deeper seepage.	Complete		• Ongoing monitoring proposed to be completed as per Recommendation 8 (refer **Section 16.3**)
	Northern Site Boundary (Surface Water) Surface water entering the site from the direction of the mine, located upgradient (north) of the site was reported to contain elevated concentrations of PFAS, with high PFAS concentrations reported to enter the site from two main watercourses represented by SW34 and BS3 CWN. Upgradient water is diverted around the northern and western boundaries of Ash Dam B via the Western Stormwater Diversion Channel. During large rainfall events, surface water diverted around the site will discharge directly to Callide Creek, with some water retained within the diversion channel. During smaller rainfall events, surface water may be retained within the diversion channel. Water retained within the diversion channel in the southwestern corner of the site is anticipated to infiltrate to groundwater through alluvial soils and eventually the Callide Creek alluvium (EMS 2022). This infiltrated water that has flowed onto site from the northern boundary is captured by the site deep seepage recovery system. Monitoring results also indicate that these upstream flows onto site from the north, have impacted upgradient groundwater, as represented by increasing concentrations of PFAS in MW74 (refer **Section 10.3**).	Ongoing Investigation		• Additional investigation required to confirm the mass flux of PFAS entering the site via the northern site boundary (Refer **Section 16.2**) • Additional works proposed to be completed as per Recommendation 5 (refer **Section 16.3**)

Source	Migration Pathways	Status	Receptor(s)	Considerations / Comments
	Measurement and calculation of PFAS flux entering the site along the northern site boundary has not been established as discussed in **Section 10.4**.			
Onsite Migration – Callide A Source Areas	The primary onsite pathways for migration of PFAS at Callide A is via surface water flows which are directed to the Eastern and Northern Stormwater Ponds (located upstream of the Ash Dam 2 catchment). Sediment comprising coal ash/dust observed in the NSP reported elevated concentrations of PFAS, indicating possible migration of PFAS via transport of sediment from the coal stockpile. Additional investigations did not confirm a specific source area that may be contributing to PFAS impacts reported in the NSP, with a localised impact within accumulated sediments in the NSP the only confirmed potential source area at Callide A. Release of water is authorised under CS Energy's Environmental Authority at Release Point R2, located at the toe of Ash Dam 2. Releases discharge directly into Dunn Creek, however during 2023 CS Energy have been pumping water from R2 release point sump and returning it to the site. PFAS has been detected in surface water within the Eastern and NSP (up to 0.0433 µg/L and 0.0798 µg/L total PFAS respectively), along with water at release point R2 (0.0053 – 0.2020 µg/L total PFAS). Surface water from areas upgradient (north) of Callide A are directed to a mine dam (Dunn Creek Dam) located adjacent to the north-eastern corner of the site. Dunn Creek Dam is an authorised mine affected water release location (Environmental authority EPML00720413 Callide Coal Mine). Concentrations of PFAS in Dunn Creek (upstream of Callide A at SW18) reported concentrations of total PFAS up to 0.244 µg/L (Mar21).	Complete	The receptors associated with the migration pathways in Callide A include: • Dermal contact, inhalation or ingestion exposure pathway to site workers operating in areas impacted by PFAS (soil or water) • Flora ecological receptors of current and future revegetated areas (including rehabilitated areas) • Ecological receptors (aquatic and terrestrial) associated with Dunn Creek and Callide Dam	• The risk to site users is considered low based upon both the decommissioned status of Callide A and the operational conditions and controls required for workers interacting with impacted soils and waters • Dunn Creek is ephemeral in nature until the discharge point into where Dunn Creek mixes with waters in Callide Dam. Samples from this location (SW36) have reported detections of PFAS in October 2022 and June 2023. It is noted that Dunn Creek has historically received discharges from Callide Mine, located north of the site. • Management of impacts to be completed as per Recommendation 1 (refer **Section 16.3**)
Offsite Migration – Surface Water	Offsite migration of PFAS via surface water flow is considered to occur as follows: • Regional surface water flows (including from Callide Power Station and southern portions of the mine) drain towards Callide Creek. • Surface water within Callide Creek flows from east to west. When the aquifer is comparable to the level of Callide Creek	Complete	The receptors associated with the offsite surface water migration pathways include: • Incidental ingestion and dermal contact exposure pathway for recreational users in surface waters	• Surface water results were reported below the recreational guideline values indicating risk is likely to be low to recreational water users • Surface water use for irrigation is likely to be limited, with only

Source	Migration Pathways	Status	Receptor(s)	Considerations / Comments
	(water level high), water will continue as surface water to downstream catchments (bypass flow). When the aquifer is below the level of Callide Creek, surface water will infiltrate into the aquifer. • Callide Creek is generally considered to be losing (surface water infiltrating to groundwater), however in some sections groundwater may discharge to surface water when the underlying aquifer is full (gaining). The current and historical mass and flux of PFAS in surface water is considered to be highly variable, and influenced by release of PFAS from source areas (historical releases higher than current releases), rainfall within the catchment, water released from Callide Dam and the water levels of the underlying aquifer. Results from aquatic biota sampling reported detections of PFOS in 15 of the 40 samples collected, with one of these samples also reporting detections of PFHxS. With the exception of one sample collected upstream of Callide Dam, all detections of PFAS in aquatic biota were reported within Callide Creek downstream of the site. Samples collected from Callide Dam and Kroombit Dam reported no detectible PFAS. Four of the target human health species reported concentrations of PFOS exceeding the FSANZ trigger point criteria (FSANZ, 2017) for fish of 5.2 µg/kg for PFOS, with a maximum concentration of 44 µg/kg reported in sample AB5-PR-EP (Rendahl's Catfish). PFAS was not detected in any of the human health target species sampled from Callide or Kroombit Dams (including Barramundi and Red Claw Crayfish). Twelve samples reported concentrations of PFOS exceeding the PFAS NEMP biota guideline value (for sum of PFOS and PFHxS) for mammalian diet (4.6 µg/kg), with nine of these samples also exceeding the guideline value for avian diet (8.2 µg/kg). All exceedances were reported in sampling locations within Callide Creek downstream of the		(Lake Callide and Callide Creek) • Human consumption of edible aquatic biota caught from Lake Callide or Callide Creek • Landholders utilising waters from Callide Creek for irrigation of consumable products and subsequent ingestion (i.e. poultry, vegetables, cattle) • Aquatic organisms in direct contact with waters impacted by PFAS (bioaccumulation) • Higher order terrestrial / avian organism consuming aquatic organisms from Callide Creek	a minority of landholders identified abstracting water from Callide Creek • Concentrations of PFOS and PFHxS reported in Callide Dam were reported below the laboratory's LOR, however results indicate PFAS is discharged to Callide Dam via the Dunn Creek catchment which could potentially be present in biota • Offsite concentrations of surface water reported below the 95% species protection limit, and sediment below the ecological direct and indirect exposure criteria, as such direct ecological exposure is likely to be low risk • Based on current advice from the DAF, there is no evidence to suggest PFAS has a detrimental effect on stock health at levels likely to be found in contaminated areas • Biota results indicate potential risks may exist to human health due to PFAS exposure via consumption of biota, and higher order organisms including mammals and birds due to PFAS exposure via consumption of biota • HHERA proposed to be completed as per

Source	Migration Pathways	Status	Receptor(s)	Considerations / Comments
	site, with the highest concentration of 89 µg/kg was reported in sample AB8-AA-WB (Agassiz's Perchlet) within Callide Weir.			Recommendation 7, with ongoing monitoring proposed to be completed as per Recommendation 8 (refer **Section 16.3**)
Offsite Migration – Groundwater	Within the Callide Creek alluvium, concentrations of PFAS are variable, but present throughout the offsite investigation area. Water movement within the Callide Creek Alluvium occurs at a rate of 4.2 m/day, with water moving from east to west and expanding (north-south) with the aquifer. Since the commissioning of Callide B Power Station, groundwater may have moved up to 17 km down the Callide Valley. Migration of PFAS is considered to mirror water movement, however migration of PFAS will occur at a slower rate. A number of mechanisms are considered to have influenced the current distribution of PFAS within the aquifer. These include: • Current and historical releases of PFAS from Callide Power Station, and other potential PFAS sources. It is noted that the current mass of PFAS entering the alluvium is considered to be lower than historical volumes, and will continue to decrease with time following cessation of AFFF use and remediation of primary source areas. • Recharging of the aquifer by surface water is likely to dilute PFAS within central areas of the alluvium (along the alignment of Callide Creek). The higher concentrations along the northern and southern margins of the aquifer are considered to represent the longer-term background concentrations prior to the commencement of surface water releases from Callide Dam which commenced in 2011. Some variability and seasonality is observed in the groundwater monitoring wells, particularly ones located in proximity to Callide Creek associated with inflows (from both contaminated [i.e. diverted water from the northern site boundary] and uncontaminated areas) and releases from Callide Dam.	Complete	The receptors associated with the groundwater offsite migration pathways include: • Human consumption of untreated groundwater for drinking water • Incidental ingestion and dermal contact exposure pathway for recreational users in water sourced from groundwater (i.e. swimming pools) Landholders utilising extracted groundwater for irrigation of consumable products and/or watering of livestock and subsequent consumption (i.e. poultry, vegetables, cattle) • Plant uptake from shallow groundwaters within the alluvial aquifer	• Where groundwater has been identified above the drinking water criteria, and is currently being used for drinking water, CS Energy are providing alternate water supply solutions including supply of bottled water, town water and/or installation/upgrade of rainwater collection tanks • Groundwater water results were reported below the recreational guideline values indicating risk is likely to be low to recreational water users • Based on current advice from DAF, there is no evidence to suggest PFAS has a detrimental effect on plant health or stock health at levels likely to be found in contaminated areas • HHERA proposed to be completed as per Recommendation 7, with ongoing monitoring proposed to be completed as per Recommendation 8 (refer **Section 16.3**)

15.2 Human Health Risks

Based on the findings of the current investigation, the following risks to human health have been identified:

- Low risk to users of the site, including site workers, from exposure to PFAS impacts soil, sediment, groundwater and surface water. Risk to site users is considered to be low based on current work health and safety controls implemented at the site, including the Site Permit to Work (PTW) and Penetration Permitting systems which regulate all ground disturbance activities.
- Low risk to users of offsite surface water, including activities such as walking, wading, swimming and fishing. Concentrations of PFAS in Callide Creek and Dunn Creek were reported below the recreational guideline values indicating risk is likely to be low.
- Potential risks to users of surface water for watering of produce with concentrations of PFAS above the drinking water guidelines adopted for assessment of irrigation of home produce (herbs, fruits and vegetables) and watering of produce including chickens (and consumption of eggs). It is noted that limited surface water use has been identified for these purposes due to the accessibility and use of groundwater.
- Potential risks to human consumers of aquatic biota caught in Callide Creek downstream of the site based on aquatic biota sampling which reported four target human health species with concentrations of PFOS exceeding the FSANZ trigger point criteria (FSANZ, 2017) for fish of 5.2 µg/kg for PFOS, with a maximum concentration of 44 µg/kg reported in sample AB5-PR-EP (Rendahl's Catfish). PFAS was not detected in any of the human health target species sampled from Callide or Kroombit Dams (including Barramundi and Red Claw Crayfish) indicating risk from consumption of aquatic biota within Callide Dam is low.
- Potential risks to users of groundwater for drinking and watering of produce with concentrations of PFAS above the drinking water guidelines (i.e. herbs, fruit and vegetables) and watering of produce including chickens (and consumption of eggs). Assessment of risks to human health via the drinking water pathway has been completed as part of a separate scope of work, with sampling undertaken of 84 landowners located downstream of the site. Where groundwater has been identified above the drinking water criteria, and is currently being used for drinking water,
  CS Energy are providing alternate water supply solutions including supply of bottled water, town water and/or installation/upgrade of rainwater collection tanks.

It is noted that no visual recreation and cultural and spiritual values were identified. It is considered that protection of human and ecological health will encompass protection of wider cultural and spiritual values.

To further assess potential risks to human health, CS Energy have commissioned a risk assessor to complete a HHERA based on current investigation findings (refer **Section 16.3**).

15.3 Ecological Risks

Based on the findings of the current investigation, the following risks to ecological receptors have been identified:

- Potential risks to aquatic organisms (direct toxicity) due to exposures to PFAS in surface water and sediments is considered to be low, with offsite concentrations of surface water reported below the 95% species protection limit, and sediment below the ecological direct and indirect exposure criteria.
- Potential risks to higher organisms such as birds and mammals due to exposure to PFAS via consumption of aquatic biota caught in Callide Creek downstream of the site based on aquatic biota sampling which reported 12 target ecological species with concentrations of PFOS exceeding the PFAS NEMP biota guideline value (for sum of PFOS and PFHxS) for mammalian diet (4.6 µg/kg), and nine of these samples also exceeding the guideline value for avian diet (8.2 µg/kg). All exceedances were reported in sampling locations within Callide Creek downstream of the site, with the highest concentration of 89 µg/kg was reported in sample AB8-AA-WB (Agassiz's Perchlet) within Callide Weir. PFAS was not detected in any of the ecological target species sampled from Callide or Kroombit Dams, with one sample collected upstream of Callide Dam reporting detections of PFOS below the biota guideline values, indicating ecological risks within and upstream of Callide Dam is low.
- Potential risks associated with potential uptake and bioaccumulation of PFAS within vegetation including agricultural crops and home produce with groundwater and surface water concentrations reported above

the drinking water criteria. It is noted that based on current advice from the DAF, there is no evidence to suggest PFAS has a detrimental effect on plant health at levels likely to be found in contaminated areas.

It is noted that based on current advice from DAF (DAF, 2017), there is no evidence to suggest PFAS has a detrimental effect on plant or stock health at levels likely to be found in contaminated areas.

To further assess potential risks to ecological receptors, CS Energy have commissioned a risk assessor to complete a HHERA based on current investigation findings (refer **Section 16.3**).

16 CONCLUSIONS AND RECOMMENDATIONS

16.1 Conclusions

In accordance with Requirement 8 of EE E-100046349, and correspondence received by DES on 4 October 2022, additional site investigations have been completed at the Callide Power Station site to address identified data gaps and recommendations of the EE CLID (Epic, 2022c) submitted under EE Requirement 5, and enable preparation of a final environmental report demonstrating that the requirements of the EE have been completed.

Investigation works have been completed within Lots 1 RP615528 and 4 SP103557, and surrounding areas, in accordance with the *National Environment Protection (Assessment of Site Contamination) Measure 2013*, the *Queensland Auditor Handbook for Contaminated Land February 2019* and the *PFAS National Environmental Management Plan, Version 2.0, January 2020*.

A summary of investigation findings associated with groundwater, surface water, sediment, soil and aquatic biota, incorporating findings of the EE CLID (Epic, 2022c) and the additional site investigations (this report) are presented in **Section 15**, with partly remaining data gaps discussed in **Section 16.2**.

Based on the findings of site investigations, the site is considered to be contributing to PFAS impacts identified within the receiving environment, including Dunn Creek, Callide Creek and the associated alluvial groundwater aquifer, noting that a number of existing measures have been adopted to reduce potential impacts and offsite releases from the site including:

- Establishment of a seepage recovery network between Ash Dam B and Callide Creek, comprising of seepage recovery wells located in the western, southern and eastern seepage areas. Current estimates (EMS, 2024) indicate that >70% of seepage is recovered, with fugitive seepage from the combined eastern/southern and western seepage areas estimated to be 145 - 190 m^3/day and 26 m^3/day respectively (EMS, 2024).
    - Five additional seepage recovery bores (MW81, MW82, MW83, MW85 and MW90) were installed in August 2023 in the eastern seepage area to support seepage recovery at the site
- Recovery of seepage from the Callide A release point R2 (via vacuum excavation truck).
- Remediation of soils at the FOT and FTG with elevated concentrations of PFAS, with approximately 1.3 kg of PFAS chemically stabilised, and reporting a reduction in the leachability of PFAS of >99.7%.
- Removal and offsite disposal of PFAS impacted concrete comprising the former FTG bund, with an estimated 0.1 kg of PFAS removed from the site.

16.2 Remaining Data Gaps

Based on the findings of additional site investigations completed at the site, the majority of identified data gaps are considered to have been investigated to inform the requirements of EE Requirement 5. Three data gaps (data gaps 4, 6 and 7) partly remain:

- **Eastern Seepage Area (Data Gap 4):** Investigations completed in the eastern seepage area have confirmed the presence of two seepage pathways, with the nature and extent of the seepage pathway further established. As part of current investigations, MW84 reported concentrations of PFAS significantly higher than previous results reported in the eastern seepage area. In addition, elevated concentrations of PFAS were reported in a sediment sample collected from the eastern diversion channel. Results for MW84 are not considered to change the current understanding of potential risk associated with the eastern seepage area based on stable concentrations observed in hydraulically downgradient bores MW32 and MW43 (refer **Section 8.3**). Additional investigation of the following items will assist in further understanding potential risk and informing potential remediation and/or management of PFAS impacts:
    - Due to the elevated concentrations of PFAS reported in MW84, future assessment to establish the source of impacts is recommended to assist in informing the ongoing management of PFAS in the eastern seepage area. The nearest known PFAS source area to MW84 (with high PFAS concentrations) is the FOT, located approximately 900 m north, however confirmation that

PFAS at MW84 is associated with the FOT, and/or the inferred geological fault line has not been established. It is noted that the existing seepage recovery system is likely to include recovery of seepage from this pathway, with additional seepage recovery bores installed in proximity to MW84 and southern portions of the seepage pathway. These additional seepage recovery bores will, when operational, assist in further reducing seepage.

- Current investigation results report the reduction of PFAS concentrations along the MW84-MW32-MW43 seepage pathway, however estimates of fugitive seepage from this pathway, and likely concentrations at the discharge point to Callide Creek have not been established. As noted above, seepage from this pathway is expected to be recovered by the existing seepage recovery system, and inclusion of new seepage recovery bores will assist in further reducing fugitive seepage. In addition, concentrations of surface water in Callide Creek at the inferred discharge point to Callide Creek (as represented by SW12) are generally reported at or below the Drinking Water Criteria.

- **Northern Boundary (Data Gap 6):** Concentrations of PFAS have been reported to be entering the northern boundary of the site via surface water, with surface water, groundwater and sediment impacts identified within the northern and Western Stormwater Diversion Channels. Additional investigations have not confirmed the mass flux of PFAS entering the site (refer **Section 10.4**) as such, further investigation will be required to confirm the mass flux of PFAS entering the site via these pathways. It is noted that additional investigation identified two additional watercourses entering the northern site boundary (as represented by BS3 CWE and BS3 CWN). As detailed in **Section 10.4**, CS Energy have commissioned a third party to install engineering solutions at the location of SW33 and SW34 to facilitate monitoring of water flows entering the site along the northern boundary.

- **Human and Ecological Health (Data Gap 7):** Potential risks to human and ecological health have been identified as detailed in **Section 15.2** and **Section 15.3** respectively. Further assessment of risk is required to quantify potential risks to human and ecological receptors. It is noted this work has commenced with CS Energy commissioning a risk assessor to complete a human health and ecological risk assessment (HHERA) to inform potential risks to ecological receptors.

16.3 Recommendations

Based on the findings of this site investigation and conclusions outlined above, the site is considered to be contributing to PFAS impacts identified within the receiving environment, including Dunn Creek, Callide Creek and the associated alluvial groundwater aquifer. It is noted however, that CS Energy have implemented a number of measures to reduce potential impacts and offsite releases from the site, and contribution of PFAS impacts from upstream/upgradient land uses has also been identified, in addition to potential downstream PFAS sources.

Based on the findings of this additional investigation, and in consideration of the findings of the EE CLID (Epic, 2022c) and remaining data gaps detailed in **Section 16.2**, the following recommendations are made in accordance with Requirements 5(e) and 5(f) of EE E-100046349:

1. Removal of localised impacts within the NSP at Callide A, to minimise potential migration of PFAS to Dunn Creek. PFAS impacts were reported in accumulated sediment within the NSP in the vicinity of investigation location CA15, with PFAS reported in surface water (SW44), seepage (R2) and groundwater (MW97) likely associated with this localised impact. Removal of sediments from the NSP will also assist in restoring the storage capacity of the NSP and minimise potential contribution to seepage at R2. Following removal of accumulated sediment in the NSP, review of current seepage management at R2 should be completed to determine if additional management controls are required to prevent offsite release of PFAS via this pathway.
2. Groundwater recovery bores (which have been tested and appropriate recovery results) installed in the eastern seepage recovery area should be incorporated into the current seepage recovery system to improve seepage recovery rates and further reduce fugitive seepage from the site. Equipping of recovery bores and incorporation into the existing seepage recovery system should be informed by CS Energy's

hydrogeologist and consider relevant operational requirements and approvals (noting recovery bore MW90 is located offsite within the Cocups Road road corridor). Based on elevated concentrations of PFAS in MW84, consideration should be given to installation of a groundwater recovery bore at this location. It is also recommended that a PFAS water treatment plant be incorporated into the existing site water management system. Consideration to be given to the location of such a system: options to consider include: seepage recovery system to treat seepage recovered from the eastern seepage area to remove PFAS prior to pumping into ADB; or installation of additional processing steps to remove PFAS as part of the main site water treatment plant.

3. Further assessment should be undertaken to establish the source of elevated PFAS concentrations reported at MW84 and EDC-SED-6, including assessment of potential association with the FOT and/or the inferred geological fault line, or whether impacts are associated with an alternative source area.
4. Further assessment should be undertaken to assess potential fugitive seepage from the MW84-MW32-MW43 seepage pathway, and likely concentrations at the discharge point to Callide Creek. Assessment should be completed in conjunction with assessment and management of the eastern seepage recovery area noting that seepage from this pathway is expected to be recovered by the existing seepage recovery system, and inclusion of new seepage recovery bores will assist in further reducing fugitive seepage.
5. Management of impacted surface water, groundwater and sediments along the northern site boundary will be required, however it is noted that the source of PFAS impacts is located upstream and offsite and owned by a third party. It is recommended that CS Energy work in collaboration with upgradient landowner(s) and DESI to determine appropriate management of identified impacts. Once upstream, offsite impacts have been adequately remediated or managed, measures should be implemented to manage any residual impacts (e.g. removal of impacted sediment).
6. Ongoing management of the FOT and FTG areas will be required, with management to be informed by results of remediation and validation works, along with previous investigation of the surrounding area. As part of management of residual soil impacts, the FOT and FTG should be incorporated into CS Energy's Site Permit to Work (PTW) and Penetration Permitting systems.
7. A Human Health and Ecological Risk Assessment (HHERA) should be completed to assess potential risks identified for human health (refer **Section 15.2**) and ecological receptors (refer **Section 15.3**). It is noted CS Energy have commissioned a risk assessor to complete a HHERA based on current investigation findings.
8. Monitoring of groundwater and surface water should continue at select groundwater and surface water locations across the site and within the study area to provide ongoing assessment of PFAS. The monitoring locations should target key migration pathways and the receiving environment to monitor potential impacts to human health and ecological receptors. Monitoring should also include monitoring locations which inform the effectiveness of and/or impacts associated with implementation of remediation and management works undertaken at the site.
9. Callide Power Station's Environmental Authority EPPR00536313 Condition 2(G3) outlines the requirements of a groundwater monitoring program and that "The submitted ground water monitoring program must be maintained". It is recommended that the Callide Power Station ground water monitoring program be updated to include:
    a. Nominated groundwater and surface water locations as identified to provide ongoing assessment of PFAS as outlined in the recommendation above
    b. PFAS monitoring constituents for each location.

16.4 Site Suitability Statement

In accordance with Section 389 (2)(b), Lots 1 RP615528 and 4 SP103557 are considered to comprise prescribed contaminated land[11] based on concentrations of PFAS reported in soil, sediment, groundwater and surface water which have the potential to cause environmental harm.

In accordance with Module 6 of the Queensland Auditor Handbook for Contaminated Land, it is considered that Outcome 4 is relevant for the site - The land described as Lot 1 RP615528 and 4 SP103557 (as shown on **Figure 1**) is contaminated by PFAS (including PFOS and PFHxS) affecting soil, sediment, groundwater and

[11] In accordance with Section 389 (4) of the EP Act, prescribed contaminated land means land contaminated in a way that is a risk of causing environmental harm to (a) land other than the relevant land; or (b) human health; or (c) another part of the environment

surface water. As of the date of this report, the land is currently being investigated, and there is insufficient information to determine site suitability at this time. Further investigation will be required to be completed at the site to address identified data gaps (**Section 16.2**) and relevant recommendations (**Section 16.3**).

NOTES:
1 QA Result Exceeds Adopted Criteria - Refer NEMP 2.0, Section 19.2
A >10% adopted to indicate a 'high' percentage of other PFAS through comparison of TOF and Total PFAS analysis. Refer Section 19.2.2 of NEMP 2.0
B Sum of PFCA/PFSA post-TOP Assay should be equal to or greater than the sum of PFCA/PFSA pre-TOP Assay, which signifies any precursors being converted to PFCA products (NEMP 2.0, Section 19.2.3)
C No PFAA precursors are detectable post oxidation, signifying complete oxidation (NEMP 2.0, Section 19.2.3)
D For aqueous samples, sum of [PFAA precursors] divided by sum of [Total PFAS] <5% (NEMP 2.0, Section 19.2.3)
E Total PFAS concentration post-TOP Assay should be greater or equal to the total PFAS concentration pre-TOP Assay, noting a decrease of up to 10% might be expected due to normal analytical variability (NEMP 2.0, Section 19.2.3)

NOTES:
1 QA Result Exceeds Adopted Criteria - Refer NEMP 2.0, Section 19.2
A <900% adopted to indicate a 'high' percentage of other PFAS through comparison of TOF and Total PFAS/TOPA analysis. Refer Section 19.2.2 of NEMP 2.0
B Sum of PFCA/PFSA post-TOP Assay should be equal to or greater than the sum of PFCA/PFSA pre-TOP Assay, which signifies any precursors being converted to PFCA products (NEMP 2.0, Section 19.2.3)
C No PFAA precursors are detectable post oxidation, signifying complete oxidation (NEMP 2.0, Section 19.2.3)
D For aqueous samples, sum of [PFAA precursors] divided by sum of [Total PFAS] <5% (NEMP 2.0, Section 19.2.3)
E Total PFAS concentration post-TOP Assay should be greater or equal to the total PFAS concentration pre-TOP Assay, noting a decrease of up to 10% might be expected due to normal analytical variability (NEMP 2.0, Section 19.2.3)

NOTES:

1	Analyte exceeds the PFAS NEMP Freshwater 99% Species Protection Limit
1	Analyte exceeds the PFAS NEMP Freshwater 95% Species Protection Limit
1	Analyte exceeds the PFAS NEMP Health Based - Drinking Water Criteria
1	Analyte exceeds the PFAS NEMP Health Based - Recreational Water Criteria
1	Analyte exceeds the ERA60 Double Lined Landfill Criteria
1	Analyte exceeds the Adopted Soil Remediation Target Criteria

APPENDIX A SQP DOCUMENTATION

Suitably qualified person declaration

In accordance with section 566 of the Environmental Protection Act 1994 *(EP Act), a suitably qualified person (SQP) must provide the administering authority with a declaration to accompany a document prepared by the SQP in relation to a regulatory function. Section 564 states that a regulatory function to be performed by an SQP means:*

- *conducting a site investigation to prepare a site investigation report*
- *preparing a validation report*
- *preparing a draft SMP or a draft amended SMP.*

A contaminated land investigation document, which needs to be prepared in accordance with section 389, can comprise any of the above documents or a combination of these.

This template is for use by a SQP to make a declaration under section 566 of the EP Act, which must accompany a contaminated land investigation document submitted to the administering authority.

1. Suitably qualified person (SQP) details

FULL NAME Luke Amies	
COMPANY Epic Environmental Pty Ltd	
REGISTERED ADDRESS 17/95 North Quay, Brisbane QLD	POSTCODE 4000
TELEPHONE 1800 779 363	
EMAIL lamies@epicenvironmental.com.au	
POSTAL ADDRESS (WRITE 'AS ABOVE' IF THE SAME AS REGISTERED ADDRESS) As Above	POSTCODE
PRESCRIBED ORGANISATION (IN ACCORDANCE WITH SCHEDULE 14 OF ENVIRONMENTAL PROTECTION REGULATION 2019) OF WHICH I AM A MEMBER: Environment Institute Of Australia And New Zealand	

2. SQP's role in preparing the contaminated land investigation document

☒ I am the suitably qualified person who prepared the contaminated land investigation document OR

☐ I am a suitably qualified person who prepared specific components of the contaminated land investigation document. (Provide details below)

The contaminated land investigation document is comprised of:

☒ Site investigation report

☐ Validation Report

☐ Draft SMP

☐ Draft amended SMP

Queensland Government

DETAILS OF THE CONTAMINATED LAND INVESTIGATION DOCUMENT (OR PART(S) THEREOF) THAT I PREPARED:

Callide Power Station - Addendum Contaminated Land Investigaiton Document (Site Investigation), 8 March 2024, Revision 0

e.g. Title, date, version and where appropriate chapter, section

3. Declaration

I do solemnly and sincerely declare that:

- I have the following qualification(s) relevant to work I have completed for the contaminated land investigation document:

Identified knowledge area required	Name of degree or post graduate qualifications (and major discipline of study if relevant)	Institution conferring the degree	Year of completion
Bachelor Degree	BEnvSc	University of Queensland	2003

- I have the following experience relevant to the work I have completed for the contaminated land investigation document

Identified knowledge area required	DETAILS OF PAST PROJECTS DEMONSTRATING EXPERIENCE IN THE IDENTIFIED KNOWLEDGE AREA					
	Nature of hazardous contaminant / notifiable activity	Site details		Role in project	Date finalised	Regulatory function under Ch. 7, Pt 8 of the EP Act (if applicable)
		Lot and Plan reference	State			
- Soil sampling - Site Investigation - Groundwater	NA 7 - Chemical Storage NA 29 - Petroleum Product or Oil Storage Hazardous Contaminant - PFAS, TRH, BTEXN, MBAS	Lots 1 DP582467, 5 DP1186727, 5 RP839952, 1 RP225692	QLD	- Sampling design - Fieldwork supervision - Reporting	2017	- Site Investigation
- Soil science - Environmental chemistry - Soil sampling - Groundwater sampling	NA 32 - Railway Yards Hazardous Contaminant (PAH, BaP, As, Cd, Pb, TRH, PFOS, PFHxS, asbestos)	61 SP188566, 63-65 SP312152, 64 SP312152	QLD	- Sampling design - Fieldwork supervision - Reporting	2018 - 2019	- Site Investigation - Validation Report - Site Management Plan
- Soil sampling - Site Investigation - Groundwater - Surface Water - Landfill Gas	NA 20 – Landfill Hazardous Contaminant - PFAS, TRH, BTEXN, Metals, PAH, Ammonia	268 SP103913, Lot 227 SP103913	QLD	- Sampling design - Soil/groundwater sampling - Fieldwork supervision - Reporting	2019 - 2021	- Site Investigation - CLID (investigation)
- Soil sampling - Site Investigation - Groundwater	NA 20 – Landfill Hazardous Contaminant - PFAS, TRH,	31 SP184383	QLD	- Sampling design - Soil/groundwater sampling - Fieldwork	2018 - 2023	- Site Investigation - CLID (investigation)

Identified knowledge area required	DETAILS OF PAST PROJECTS DEMONSTRATING EXPERIENCE IN THE IDENTIFIED KNOWLEDGE AREA					
	Nature of hazardous contaminant / notifiable activity	Site details		Role in project	Date finalised	Regulatory function under Ch. 7, Pt 8 of the EP Act (if applicable)
		Lot and Plan reference	State			
- Surface Water - Landfill Gas	BTEXN, Metals, PAH, Ammonia			supervision - Reporting		

- I have not knowingly included false, misleading or incomplete information in the document.
- I have not knowingly failed to reveal any relevant information or document to the administering authority.
- The contaminated land investigation document (or part thereof which I have prepared) addresses the relevant matters for the function and is factually correct.
- The opinions expressed within the contaminated land investigation document (or part thereof which I have prepared) are honestly and reasonably held.

SQP'S NAME: Luke Amies

Wednesday, 15 December 2021

Take notice: that under the *Environmental Protection Act 1994* (the Act) a notice to conduct or commission an environmental investigation is issued to CS Energy Limited (you) (CS Energy) by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Science (the department).

The notice to conduct or commission an environmental investigation is issued in respect of the activities of CS Energy on land described as Lot 1/RP615528 and Lot 4/SP103557 (the premises).

A. Grounds

The notice to conduct or commission an environmental investigation is issued on the following grounds:

1. Under section 326BA of the Act, the department is satisfied on reasonable grounds that:
   (a) particulars of the land are recorded in the environmental management register or contaminated land register,
   (b) the hazardous contaminant contaminating the land is in a concentration that has the potential to cause serious environmental harm or material environmental harm,
   (c) a person, animal or another part of the environment may be exposed to the hazardous contaminant, whether on the land or not.

The facts and circumstances forming the basis for these grounds are:

1) CS Energy hold Environmental Authority EPPR00536313 (the EA) which authorises Environmentally Relevant Activities (ERA):
   - 14 – Electricity Generation, 2: Generating electricity by using a fuel, other than gas, at a rating capacity of, (b) more than 150MW electrical.
   - 08 – Chemical Storage, 1: Storing a total of 50t or more of chemicals of dangerous goods class 1 or class 2, division 2.3 under subsection (1)(a).
   - 08 - Chemical Storage, 3: Storing more than 500 cubic metres of chemicals of class C1 or C2 combustible liquids under AS 1940 or dangerous goods class 3 under subsection (1)(c).
   - 56 – Regulated Waste Storage, Receiving and storing regulated waste.

Queensland Government

- 60 - Waste disposal, 1: Operating a facility for disposing of, in a year, the following quantity of waste mentioned in subsection (1) (a), (d) more than 200,000t.
- 63 – Sewage Treatment, 1: Operating sewage treatment works, other than no-release works, with a total daily design capacity of, (b-ii) more than 100 but not more than 1500EP otherwise.

2) Lot 1/RP615528 and Lot 4/SP103557 are listed on the Environmental Management Register.

3) On 13 August 2019 CS Energy engaged an independent suitably qualified person (**SQP**) under the *Environmental Protection Act 1994* (the Act) to commence investigation works into potential impacts and risks associated with the historical use of aqueous film-forming foam (AFFF) at the premises.

4) On 23 July 2020 CS Energy provided the department with a preliminary site investigation (**PSI)** titled *Preliminary PFAS Environmental Investigation – Callide Power Station* which identified potential onsite risks associated with the historical use of AFFF at the premises. The report recommended completion of an onsite sampling program to quantify potential risks identified, including sampling of surface water, groundwater, soils and sediment.

5) On 1 October 2020 CS Energy provided the department with a sampling analysis and quality plan (**SAQP)** titled *Sampling Analysis and Quality Plan (PFAS) – Callide Power Station* detailing proposed investigation of potential AFFF at the premises and potential migration pathways, targeting groundwater, surface water, soil and sediment.

6) On 17 November 2020 CS Energy notified the department of preliminary PFAS sampling results from the Callide Power Station which indicated that onsite groundwater, surface water, soils and sediments contained varying levels of PFAS contamination, including the detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

7) On 18 December 2020 CS Energy provided the department with a monitoring plan titled *Addendum Monitoring Plan – Callide Power Station SAQP (PFAS)*. The addendum monitoring plan detailed proposed investigation at offsite groundwater and surface water monitoring locations following detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

8) On 29 January 2021 CS Energy provided the department with a report titled *Callide Power Station – Targeted PFAS Environmental Investigation* which states 'Historical information available for the site identifies that potential historical use of AFFF at the Callide B and C Power Station site is likely to be less than 1,000L, including use of up to 300L of AFFF concentrate in training activities, system tests and use/maintenance of extinguishers, and a further approximately 500L of AFFF concentrate used in emergency response associated with coal fires at the Coal Plant.

9) The report also stated that 'the most likely potential onsite pathway comprised the potential migration from primary to secondary source areas to offsite receptors including surface waters (Callide Creek, Dunn Creek and Callide Dam) and fractured rock aquifers located beneath the site (connected to alluvial aquifers and surface water)'.

10) On 4 February 2021 CS Energy notified the department of detection of PFAS exceeding the Australian Drinking Water Guideline (ADWG) for PFOS + PFHxS (0.07 µg/L) in offsite groundwater monitoring wells downstream of the site following implementation of the Addendum Monitoring Plan.

11) On 10 February 2021 CS Energy engaged an approved contaminated land auditor to oversee the implementation of the investigation.

12) On 24 September 2021 CS Energy submitted sampling results to the department which indicated that concentrations of PFOS + PFHxS monitored in 9 onsite groundwater bores were above the ADWG.

13) Sampling results submitted on 24 September 2021 also indicate concentrations of PFOS + PFHxS above the ADWG in private groundwater bores downstream of the site with concentrations up to 0.369ug/L.

14) On 24 September 2021, CS Energy reported that 6 private bores located downstream of the site used for drinking water were being impacted by PFAS contamination above the ADWG levels and that CS Energy was supplying drinking water to 15 households who relied upon these bores for drinking and/or domestic purposes.

15) An environmental value is defined in section 9 of *the Act* as follows:
    a) *A quality or physical characteristic of the environment that is conducive to ecological health or public amenity or safety; or*
    b) *Another quality of the environment identified and declared to be an environmental value under an environmental protection policy or regulation.*

16) Under the Environmental Protection (Water and Wetland Biodiversity) Policy 2019 (Water EPP), all Queensland waters including groundwater and surface waters have prescribed environmental values and water quality objectives. Environmental values and water quality objectives for these waters are listed in schedule 1 of the Water EPP.

17) The groundwater environmental values which apply in the Callide Creek Catchment include drinking water, irrigation, farm water supply, aquatic ecosystem protection, stock water, primary recreation, industrial use and cultural and spiritual values.

18) Groundwater downstream of the site is used by landholders for drinking, domestic, irrigation, farm water supply and stock watering.

19) The groundwater flows through the Callide Creek Aquifer generally in a westerly direction from the premises.

20) Public amenity and safety are environmental values prescribed by the Act, that may be adversely affected by PFAS contamination of groundwater, particularly through contamination of drinking water above the ADWG.

21) Ecological health is an additional environmental value prescribed by the Act that has the potential to be adversely affected by the release of PFAS into the environment, through bioaccumulation in aquatic and terrestrial organisms.

22) PFAS contamination can be environmentally significant due to its persistence, mobility and, for some PFAS, toxicity and potential bioaccumulation in plants and animals (HEPA 2020).

23) Environmental harm is defined in section 14 of *the Act* as follows:

(1) Environmental harm is any adverse effect, or potential adverse effect (whether temporary or permanent and of whatever magnitude, duration or frequency) on an environmental value, and includes environmental nuisance.

(2) Environmental harm may be caused by an activity—

(a) whether the harm is a direct or indirect result of the activity; or

(b) whether the harm results from the activity alone or from the combined effects of the activity and other activities or factors.

24) PFAS contamination has the potential to negatively impact environmental values by a variety of mechanisms including via concentration and accumulation in food stuff, drinking water, contact, ingestion and product usage.

25) Perfluorooctane sulfonate (PFOS) is a compound that is also PFAS.

26) PFAS compounds, including PFOS, are prescribed water contaminants under Schedule 10 of the Environmental Protection Regulation 2019.

27) Based on the facts and circumstances above, the department is satisfied that the contamination of the land and groundwater by PFAS compounds has the potential to cause environmental harm through migration offsite where it is contributing to contamination of groundwater used for drinking water. The environmental value that is primarily adversely impacted is public safety as the contamination of groundwater is above the Australian Drinking Water Guideline.

B. Requirements

The report on the environmental investigation must address the following relevant matters:

Where existing investigations have been completed, and are relevant to addressing the requirements of this notice, you may use these investigations to address relevant parts of this notice, pending agreement by the SQP and the auditor.

1) **By 5:00 pm on 17 December 2021** you must engage an independent **SQP** under the Act to carry out the requirements of this notice. The SQP must demonstrate skills and experience in technical fields such as soil and groundwater contamination assessment and with particular skills relevant to AFFF firefighting foams containing PFAS.

~~**2)**~~ **By 5:00 pm on 17 December 2021** you must engage an approved contaminated land auditor to undertake an auditor's function as outlined in Section 568(b) of the Act, to oversee the SQP carrying out the requirements of this notice.

3) **By 5:00 pm on 28 February 2022** you must develop and submit a sampling, analysis and quality plan (**SAQP**) to the department to characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises for the purpose of preparing a site investigation report as defined in section 387 of the Act. This plan must be prepared by a SQP and consented to by a contaminated land auditor.

   This investigation detailed in the SAQP must, as a minimum:
   a) evaluate the nature and extent of PFAS contamination likely to have been caused by any direct or indirect release of AFFF from the premises to soil, water, groundwater, sediments and, include biota sampling in Callide Creek adjoining the premises as part of the investigation; and
   b) assess likely pathways of PFAS contamination from the release of AFFF from the premises including, but not limited to, the premises, surface waters, drainage lines, stormwater infrastructure and groundwater in the vicinity of the premises; and
   c) assess the nature of the connectivity/completeness of those likely pathways by, assessing (where applicable) groundwater levels versus surface water levels and connectivity, hydraulic conductivity and groundwater velocity, and evaluate the potential for surface water releases from Callide dam to enhance migration of PFAS contaminants from the site.
   d) the sampling analysis must be generally in accordance with all requirements stated in **Requirement 7**.

4) **By 5:00 pm on 7 March 2022** you must commence sampling and analysis in accordance with the SAQP required by Requirement 3.

5) **By 5:00 pm on 7 September 2022** you must submit a contaminated land investigation document (**CLID**) in accordance with the content requirements of section 389 of the Act, that is a site investigation report detailing the findings of the sampling, analysis and quality plan to determine the nature and extent of impact arising from any direct or indirect release of any hazardous PFAS contaminants from the release of AFFF.

   The CLID must also include, but is not limited to the following:
   a) Evaluate known historical activities undertaken at the premises which has involved the use, storage (including volume), handling, foam types and potential release of AFFF PFAS containing material;
   b) Provide analytical data that characterises the nature of the PFAS at the premises and that which has been released or potentially released to assist in determining the nature and extent of PFAS contamination in the receiving environment;
   c) Provide analysis of potentially affected media including soil, sediment, surface water, groundwater and biota and identify potential pathways for impacts to human and biota receptors;
   d) Provide all monitoring results and an analysis of the extent of PFAS contamination in soils, sediment, surface water, groundwater and biota;
   e) Assess the potential for environmental harm (actual or potential) and provide recommendations for the implementation of reasonable and practicable options to prevent or minimise any further releases of PFAS from identified sources and manage and monitor environmental and human health risks; and
   f) Provide remediation options to remove the contamination and treat the contamination taking into account the extent of any residual contamination in soils, sediment, groundwater and surface waters that affect the premises or other receptors.

6) The investigations required by this notice must meet the requirements for a CLID for the land in accordance with section 389 and 390 of the Act. A CLID must be prepared by a SQP as required by and in accordance with Chapter 12, Part 3 of the Act and be accompanied by an auditor certification that the CLID complies with section 389(1) and (2) of the Act.

7) You must ensure that the following requirements, to the extent that they are applicable and specified requirements are not otherwise referred to, are met when conducting the investigation and preparing the report:

a. The investigation is conducted in accordance with the following:
   i. *the Act* – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/act-1994-062;
   ii. The Policy – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/sl-2019-0156;
   iii. Queensland Water Quality Guidelines (2009) – see https://environment.des.qld.gov.au/management/water/quality-guidelines;
   iv. Monitoring and Sampling Manual 2018 Environmental Protection (Water) Policy 2009 Version 2 June 2018 see - https://environment.des.qld.gov.au/__data/assets/pdf_file/0031/89914/monitoring-sampling-manual-2018.pdf;
   v. National Environmental Protection (Assessment of Site Contamination) Measure 1999 – see http://nepc.gov.au/nepms/assessment-site-contamination;
   vi. Queensland Auditor Handbook for Contaminated Land – see https://www.qld.gov.au/environment/pollution/management/contaminated-land/auditors/auditor-handbook;
   vii. Assessment of impact of human health considering the Tolerable Daily Intakes for PFOS, PFOA, and PFHxS recommended by Food Standards Australia New Zealand (FSANZ);
   viii. Where PFAS are encountered in water bodies at the premise which are accessible to fauna such as birds and mammals, qualitative consideration of water to animal bioaccumulation factors reported in research publications concerning those contaminants in evaluating potential environmental harm to such animals; and
   ix. Assessment of contamination considering guidance provided in the PFAS NEMP – see https://www.qld.gov.au/environment/pollution/management/disasters/investigation-pfas/management-plan.

b. An assessment of edible portions (biota) must be used in estimating risks of exceeding the tolerable daily intakes, being consistent with the Queensland Health Guideline for sampling and analysis of seafood suitable for human health risk assessments of PFAS contamination (see https://www.qld.gov.au/__data/assets/pdf_file/0032/68684/pfas-fish-sampling-protocol.pdf) and adopting portion sizes recommended by Food Standards Australia New Zealand (FSANZ) in addition to assessment of whole species (biota) to evaluate bioaccumulation risk; and

c. Wherever practical, all samples must be analysed by a NATA accredited laboratory (it is noted that in biota sampling this may not be applicable); and

d. The analytical data on all media (soil, sediment, water, groundwater and biota) must include results for sampling to determine total organic fluorine, total oxidisable precursor (TOP) assay, and the suite of 20 to 28 standard fluorinated organic compounds by liquid chromatography-mass spectrometry (LC/MS/MS) available from commercial laboratories reported as the

analyses for the resulting perfluorinated carboxylates for C4 to C14 carbon chain length (TOP C4-C14); and

e. Note that as analytical and instrumental improvements are made regarding the analysis for PFAS it is understood that some laboratories are increasing the standard suite which may assist you in distinguishing between the premises sources of PFAS and other potential sources; and
f. Where TOP Assay is performed, quality assurance checks must include that oxidant exhaustion has not occurred (e.g. reanalysis to determine presence of fluorotelomer); and
g. Groundwater bores are constructed in accordance with the Minimum Construction Requirements for Water Bores in Australia (4th edition).

8) **By 5:00 pm on 7 October 2022** you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.

The environmental investigation must be carried out, and the environmental report prepared by a suitably qualified person. A suitably quality person is defined as a person who has professional qualifications, training, skills or experience relevant to the Environmental Evaluation requirements, and can give authoritative assessment, advice and analysis in relation to the Environmental Evaluation using relative relevant protocols, standards, methods or literature.

As the recipient of this notice, you are also required to provide a statutory declaration in the form attached, to accompany the environmental report submitted to the department.

The suitably qualified person who prepares the environmental report and the contaminated land auditor must also provide a statutory declaration in the form attached to the environmental report submitted to the department.

Copies of the template statutory declarations can also be accessed from the Queensland Government website at www.qld.gov.au, using the publication number as a search term:

1. Statutory declaration environmental evaluation for recipient (ESR/2016/1997)
2. Statutory declaration for suitably qualified person (ESR/2016/2266)
3. Statutory declaration for auditor (ESR/2016/2265)

Take notice:

1. The requirements of the notice to conduct or commission an environmental investigation take effect immediately upon service of this notice;
2. This notice remains in force until further notice from the department; and
3. You are responsible for meeting the costs of conducting or commissioning the environmental evaluation, preparing the environmental report and providing any further information as requested by the department.

C. Reviews and appeals

The provisions regarding reviews of decisions and appeals are found in sections 519 to 539 of the Act.

A person who is dissatisfied with certain decisions of the department, may be able to apply to have the department review that original decision.

Generally, a request to have a decision reviewed must:

- be made within 10 business days of the decision being notified to the person;
- be supported by enough information to enable the department to decide the application for review; and
- be made using the application form, Application for review of original decision (ESR/2015/1573) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1573) as a search term.

Where an application has been made for a decision to be reviewed, the applicant may also apply to the relevant court for a stay of the decision to secure the effectiveness of the review.

Once the original decision has been reviewed, a person who is dissatisfied with the review decision may be able to appeal against that decision to the relevant court within 22 business days after receiving notice of the review decision.

A person whose interests are or would be adversely affected by a decision of the department may also be able to request a statement of reasons for a decision or a statutory order review under the *Judicial Review Act 1991*.

For further information about reviews and appeals see the information sheet, Internal review and appeals (ESR/2015/1742) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1742) as a search term.

The information sheets are available on the Queensland Government website at www.qld.gov.au, using the publication number as a search term.

You may have other legal rights or obligations and should seek your own legal advice.

D. Penalty

Failure to comply with a notice to conduct or commission an environmental evaluation is an offence.

1. The maximum penalty for an individual is 300 penalty units.
2. The maximum penalty for a corporation is 1500 penalty units.

Should you have any queries in relation to this notice, please contact Joshua Radloff, A/Team Leader on (07) 4971 6509 or email cwes_gladstone@des.qld.gov.au.

Environmental Evaluation

Notice to conduct or commission an environmental evaluation

This notice to conduct or commission an environmental evaluation is issued by the administering authority pursuant to section 326B of the Environmental Protection Act 1994 *on 15 December 2021. This amended version has been made under section 24AA of the* Acts Interpretation Act 1954.

CS Energy Limited
Level 2, HQ (North Tower) 540 Wickham Street

Tuesday, 4 October 2022

Take notice: that under the *Environmental Protection Act 1994* (the Act) this amended notice to conduct or commission an environmental investigation is issued to CS Energy Limited (you) (CS Energy) by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Science (the department).

This amended notice to conduct or commission an environmental investigation is issued in respect of the activities of CS Energy on land described as Lot 1/RP615528 and Lot 4/SP103557 (the premises).

The notice to conduct or commission an environmental investigation was originally issued on 15 December 2021. New text in the amended notice is shown as underlined.

A. Grounds

The notice to conduct or commission an environmental investigation is issued on the following grounds:

1. Under section 326BA of the Act, the department is satisfied on reasonable grounds that:
   (a) particulars of the land are recorded in the environmental management register or contaminated land register,
   (b) the hazardous contaminant contaminating the land is in a concentration that has the potential to cause serious environmental harm or material environmental harm,
   (c) a person, animal or another part of the environment may be exposed to the hazardous contaminant, whether on the land or not.

The facts and circumstances forming the basis for these grounds are:

1) CS Energy hold Environmental Authority EPPR00536313 (the EA) which authorises Environmentally Relevant Activities (ERA):
   - 14 – Electricity Generation, 2: Generating electricity by using a fuel, other than gas, at a rating capacity of, (b) more than 150MW electrical.

Queensland Government

- 08 – Chemical Storage, 1: Storing a total of 50t or more of chemicals of dangerous goods class 1 or class 2, division 2.3 under subsection (1)(a).
- 08 - Chemical Storage, 3: Storing more than 500 cubic metres of chemicals of class C1 or C2 combustible liquids under AS 1940 or dangerous goods class 3 under subsection (1)(c).
- 56 – Regulated Waste Storage, Receiving and storing regulated waste.
- 60 - Waste disposal, 1: Operating a facility for disposing of, in a year, the following quantity of waste mentioned in subsection (1) (a), (d) more than 200,000t.
- 63 – Sewage Treatment, 1: Operating sewage treatment works, other than no-release works, with a total daily design capacity of, (b-ii) more than 100 but not more than 1500EP otherwise.

2) Lot 1/RP615528 and Lot 4/SP103557 are listed on the Environmental Management Register.

3) On 13 August 2019 CS Energy engaged an independent suitably qualified person (**SQP**) under the *Environmental Protection Act 1994* (the Act) to commence investigation works into potential impacts and risks associated with the historical use of aqueous film-forming foam (AFFF) at the premises.

4) On 23 July 2020 CS Energy provided the department with a preliminary site investigation (**PSI)** titled *Preliminary PFAS Environmental Investigation – Callide Power Station* which identified potential onsite risks associated with the historical use of AFFF at the premises. The report recommended completion of an onsite sampling program to quantify potential risks identified, including sampling of surface water, groundwater, soils and sediment.

5) On 1 October 2020 CS Energy provided the department with a sampling analysis and quality plan (**SAQP)** titled *Sampling Analysis and Quality Plan (PFAS) – Callide Power Station* detailing proposed investigation of potential AFFF at the premises and potential migration pathways, targeting groundwater, surface water, soil and sediment.

6) On 17 November 2020 CS Energy notified the department of preliminary PFAS sampling results from the Callide Power Station which indicated that onsite groundwater, surface water, soils and sediments contained varying levels of PFAS contamination, including the detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

7) On 18 December 2020 CS Energy provided the department with a monitoring plan titled *Addendum Monitoring Plan – Callide Power Station SAQP (PFAS)*. The addendum monitoring plan detailed proposed investigation at offsite groundwater and surface water monitoring locations following detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

8) On 29 January 2021 CS Energy provided the department with a report titled *Callide Power Station – Targeted PFAS Environmental Investigation* which states 'Historical information available for the site identifies that potential historical use of AFFF at the Callide B and C Power Station site is likely to be less than 1,000L, including use of up to 300L of AFFF concentrate in training activities, system tests and use/maintenance of extinguishers, and a further approximately 500L of AFFF concentrate used in emergency response associated with coal fires at the Coal Plant.

9) The report also stated that 'the most likely potential onsite pathway comprised the potential migration from primary to secondary source areas to offsite receptors including surface waters (Callide Creek,

Dunn Creek and Callide Dam) and fractured rock aquifers located beneath the site (connected to alluvial aquifers and surface water)'.

10) On 4 February 2021 CS Energy notified the department of detection of PFAS exceeding the Australian Drinking Water Guideline (ADWG) for PFOS + PFHxS (0.07 µg/L) in offsite groundwater monitoring wells downstream of the site following implementation of the Addendum Monitoring Plan.

11) On 10 February 2021 CS Energy engaged an approved contaminated land auditor to oversee the implementation of the investigation.

12) On 24 September 2021 CS Energy submitted sampling results to the department which indicated that concentrations of PFOS + PFHxS monitored in 9 onsite groundwater bores were above the ADWG.

13) Sampling results submitted on 24 September 2021 also indicate concentrations of PFOS + PFHxS above the ADWG in private groundwater bores downstream of the site with concentrations up to 0.369ug/L.

14) On 24 September 2021, CS Energy reported that 6 private bores located downstream of the site used for drinking water were being impacted by PFAS contamination above the ADWG levels and that CS Energy was supplying drinking water to 15 households who relied upon these bores for drinking and/or domestic purposes.

15) An environmental value is defined in section 9 of *the Act* as follows:
    a) *A quality or physical characteristic of the environment that is conducive to ecological health or public amenity or safety; or*
    b) *Another quality of the environment identified and declared to be an environmental value under an environmental protection policy or regulation.*

16) Under the Environmental Protection (Water and Wetland Biodiversity) Policy 2019 (Water EPP), all Queensland waters including groundwater and surface waters have prescribed environmental values and water quality objectives. Environmental values and water quality objectives for these waters are listed in schedule 1 of the Water EPP.

17) The groundwater environmental values which apply in the Callide Creek Catchment include drinking water, irrigation, farm water supply, aquatic ecosystem protection, stock water, primary recreation, industrial use and cultural and spiritual values.

18) Groundwater downstream of the site is used by landholders for drinking, domestic, irrigation, farm water supply and stock watering.

19) The groundwater flows through the Callide Creek Aquifer generally in a westerly direction from the premises.

20) Public amenity and safety are environmental values prescribed by the Act, that may be adversely affected by PFAS contamination of groundwater, particularly through contamination of drinking water above the ADWG.

21) Ecological health is an additional environmental value prescribed by the Act that has the potential to be adversely affected by the release of PFAS into the environment, through bioaccumulation in aquatic and terrestrial organisms.

22) PFAS contamination can be environmentally significant due to its persistence, mobility and, for some PFAS, toxicity and potential bioaccumulation in plants and animals (HEPA 2020).

23) Environmental harm is defined in section 14 of *the Act* as follows:

(1) Environmental harm is any adverse effect, or potential adverse effect (whether temporary or permanent and of whatever magnitude, duration or frequency) on an environmental value, and includes environmental nuisance.

(2) Environmental harm may be caused by an activity—

(a) whether the harm is a direct or indirect result of the activity; or

(b) whether the harm results from the activity alone or from the combined effects of the activity and other activities or factors.

24) PFAS contamination has the potential to negatively impact environmental values by a variety of mechanisms including via concentration and accumulation in food stuff, drinking water, contact, ingestion and product usage.

25) Perfluorooctane sulfonate (PFOS) is a compound that is also PFAS.

26) PFAS compounds, including PFOS, are prescribed water contaminants under Schedule 10 of the Environmental Protection Regulation 2019.

27) Based on the facts and circumstances above, the department is satisfied that the contamination of the land and groundwater by PFAS compounds has the potential to cause environmental harm through migration offsite where it is contributing to contamination of groundwater used for drinking water. The environmental value that is primarily adversely impacted is public safety as the contamination of groundwater is above the Australian Drinking Water Guideline.

28) On 7 September 2022 CS Energy submitted a Contaminated Land Investigation Document in accordance with Requirement 5 of this environmental investigation.

29) On 28 September 2022, CS Energy met with the department to discuss data gaps identified in the Contaminated Land Investigation Document. As a result of the meeting the department has determined that the timeframe in Requirement 8 will be amended to allow the further investigations to address data gaps and meet the requirements of the environmental investigation.

B. Requirements

The report on the environmental investigation must address the following relevant matters:

Where existing investigations have been completed, and are relevant to addressing the requirements of this notice, you may use these investigations to address relevant parts of this notice, pending agreement by the SQP and the auditor.

1) **By 5:00 pm on 17 December 2021** you must engage an independent **SQP** under the Act to carry out the requirements of this notice. The SQP must demonstrate skills and experience in technical fields such as soil and groundwater contamination assessment and with particular skills relevant to AFFF firefighting foams containing PFAS.

~~2)~~ **By 5:00 pm on 17 December 2021** you must engage an approved contaminated land auditor to undertake an auditor's function as outlined in Section 568(b) of the Act, to oversee the SQP carrying out the requirements of this notice.

3) **By 5:00 pm on 28 February 2022** you must develop and submit a sampling, analysis and quality plan (**SAQP**) to the department to characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises for the purpose of preparing a site investigation report as defined in section 387 of the Act. This plan must be prepared by a SQP and consented to by a contaminated land auditor.

   This investigation detailed in the SAQP must, as a minimum:
   a) evaluate the nature and extent of PFAS contamination likely to have been caused by any direct or indirect release of AFFF from the premises to soil, water, groundwater, sediments and, include biota sampling in Callide Creek adjoining the premises as part of the investigation; and
   b) assess likely pathways of PFAS contamination from the release of AFFF from the premises including, but not limited to, the premises, surface waters, drainage lines, stormwater infrastructure and groundwater in the vicinity of the premises; and
   c) assess the nature of the connectivity/completeness of those likely pathways by, assessing (where applicable) groundwater levels versus surface water levels and connectivity, hydraulic conductivity and groundwater velocity, and evaluate the potential for surface water releases from Callide dam to enhance migration of PFAS contaminants from the site.
   d) the sampling analysis must be generally in accordance with all requirements stated in **Requirement 7**.

4) **By 5:00 pm on 7 March 2022** you must commence sampling and analysis in accordance with the SAQP required by Requirement 3.

5) **By 5:00 pm on 7 September 2022** you must submit a contaminated land investigation document (**CLID**) in accordance with the content requirements of section 389 of the Act, that is a site investigation report detailing the findings of the sampling, analysis and quality plan to determine the nature and extent of impact arising from any direct or indirect release of any hazardous PFAS contaminants from the release of AFFF.

   The CLID must also include, but is not limited to the following:
   a) Evaluate known historical activities undertaken at the premises which has involved the use, storage (including volume), handling, foam types and potential release of AFFF PFAS containing material;
   b) Provide analytical data that characterises the nature of the PFAS at the premises and that which has been released or potentially released to assist in determining the nature and extent of PFAS contamination in the receiving environment;
   c) Provide analysis of potentially affected media including soil, sediment, surface water, groundwater and biota and identify potential pathways for impacts to human and biota receptors;

d) Provide all monitoring results and an analysis of the extent of PFAS contamination in soils, sediment, surface water, groundwater and biota;
e) Assess the potential for environmental harm (actual or potential) and provide recommendations for the implementation of reasonable and practicable options to prevent or minimise any further releases of PFAS from identified sources and manage and monitor environmental and human health risks; and
f) Provide remediation options to remove the contamination and treat the contamination taking into account the extent of any residual contamination in soils, sediment, groundwater and surface waters that affect the premises or other receptors.

6) The investigations required by this notice must meet the requirements for a CLID for the land in accordance with section 389 and 390 of the Act. A CLID must be prepared by a SQP as required by and in accordance with Chapter 12, Part 3 of the Act and be accompanied by an auditor certification that the CLID complies with section 389(1) and (2) of the Act.

7) You must ensure that the following requirements, to the extent that they are applicable and specified requirements are not otherwise referred to, are met when conducting the investigation and preparing the report:

a. The investigation is conducted in accordance with the following:
   i. *the Act* – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/act-1994-062;
   ii. The Policy – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/sl-2019-0156;
   iii. Queensland Water Quality Guidelines (2009) – see https://environment.des.qld.gov.au/management/water/quality-guidelines;
   iv. Monitoring and Sampling Manual 2018 Environmental Protection (Water) Policy 2009 Version 2 June 2018 see - https://environment.des.qld.gov.au/__data/assets/pdf_file/0031/89914/monitoring-sampling-manual-2018.pdf;
   v. National Environmental Protection (Assessment of Site Contamination) Measure 1999 – see http://nepc.gov.au/nepms/assessment-site-contamination;
   vi. Queensland Auditor Handbook for Contaminated Land – see https://www.qld.gov.au/environment/pollution/management/contaminated-land/auditors/auditor-handbook;
   vii. Assessment of impact of human health considering the Tolerable Daily Intakes for PFOS, PFOA, and PFHxS recommended by Food Standards Australia New Zealand (FSANZ);
   viii. Where PFAS are encountered in water bodies at the premise which are accessible to fauna such as birds and mammals, qualitative consideration of water to animal bioaccumulation factors reported in research publications concerning those contaminants in evaluating potential environmental harm to such animals; and
   ix. Assessment of contamination considering guidance provided in the PFAS NEMP – see https://www.qld.gov.au/environment/pollution/management/disasters/investigation-pfas/management-plan.
b. An assessment of edible portions (biota) must be used in estimating risks of exceeding the tolerable daily intakes, being consistent with the Queensland Health Guideline for sampling and analysis of seafood suitable for human health risk assessments of PFAS contamination (see

https://www.qld.gov.au/__data/assets/pdf_file/0032/68684/pfas-fish-sampling-protocol.pdf) and adopting portion sizes recommended by Food Standards Australia New Zealand (FSANZ) in addition to assessment of whole species (biota) to evaluate bioaccumulation risk; and

c. Wherever practical, all samples must be analysed by a NATA accredited laboratory (it is noted that in biota sampling this may not be applicable); and
d. The analytical data on all media (soil, sediment, water, groundwater and biota) must include results for sampling to determine total organic fluorine, total oxidisable precursor (TOP) assay, and the suite of 20 to 28 standard fluorinated organic compounds by liquid chromatography-mass spectrometry (LC/MS/MS) available from commercial laboratories reported as the analyses for the resulting perfluorinated carboxylates for C4 to C14 carbon chain length (TOP C4-C14); and
e. Note that as analytical and instrumental improvements are made regarding the analysis for PFAS it is understood that some laboratories are increasing the standard suite which may assist you in distinguishing between the premises sources of PFAS and other potential sources; and
f. Where TOP Assay is performed, quality assurance checks must include that oxidant exhaustion has not occurred (e.g. reanalysis to determine presence of fluorotelomer); and
g. Groundwater bores are constructed in accordance with the Minimum Construction Requirements for Water Bores in Australia (4th edition).

8) **By 5:00 pm on 13 October 2023** you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.

The environmental investigation must be carried out, and the environmental report prepared by a suitably qualified person. A suitably quality person is defined as a person who has professional qualifications, training, skills or experience relevant to the Environmental Evaluation requirements, and can give authoritative assessment, advice and analysis in relation to the Environmental Evaluation using relative relevant protocols, standards, methods or literature.

As the recipient of this notice, you are also required to provide a statutory declaration in the form attached, to accompany the environmental report submitted to the department.

The suitably qualified person who prepares the environmental report and the contaminated land auditor must also provide a statutory declaration in the form attached to the environmental report submitted to the department.

Copies of the template statutory declarations can also be accessed from the Queensland Government website at www.qld.gov.au, using the publication number as a search term:

1. Statutory declaration environmental evaluation for recipient (ESR/2016/1997)
2. Statutory declaration for suitably qualified person (ESR/2016/2266)
3. Statutory declaration for auditor (ESR/2016/2265)

Take notice:

1. The requirements of the notice to conduct or commission an environmental investigation take effect immediately upon service of this notice;
2. This notice remains in force until further notice from the department; and

3. You are responsible for meeting the costs of conducting or commissioning the environmental evaluation, preparing the environmental report and providing any further information as requested by the department.

C. Reviews and appeals

The provisions regarding reviews of decisions and appeals are found in sections 519 to 539 of the Act.

A person who is dissatisfied with certain decisions of the department, may be able to apply to have the department review that original decision.

Generally, a request to have a decision reviewed must:

- be made within 10 business days of the decision being notified to the person;
- be supported by enough information to enable the department to decide the application for review; and
- be made using the application form, Application for review of original decision (ESR/2015/1573) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1573) as a search term.

Where an application has been made for a decision to be reviewed, the applicant may also apply to the relevant court for a stay of the decision to secure the effectiveness of the review.

Once the original decision has been reviewed, a person who is dissatisfied with the review decision may be able to appeal against that decision to the relevant court within 22 business days after receiving notice of the review decision.

A person whose interests are or would be adversely affected by a decision of the department may also be able to request a statement of reasons for a decision or a statutory order review under the *Judicial Review Act 1991*.

For further information about reviews and appeals see the information sheet, Internal review and appeals (ESR/2015/1742) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1742) as a search term.

The information sheets are available on the Queensland Government website at www.qld.gov.au, using the publication number as a search term.

You may have other legal rights or obligations and should seek your own legal advice.

D. Penalty

Failure to comply with a notice to conduct or commission an environmental evaluation is an offence.

1. The maximum penalty for an individual is 300 penalty units.
2. The maximum penalty for a corporation is 1500 penalty units.

Should you have any queries in relation to this notice, please contact Joshua Radloff, A/Team Leader on (07) 4971 6509 or email cwes_gladstone@des.qld.gov.au.

Attn: Mr Brendan Monckton

Dear Mr Monckton

Amended Environmental Evaluation E-1000046349

I refer to the *Notice to conduct of commission an environmental evaluation* (EE) issued by the Department of Environment and Science (the department) under section 326B of the *Environmental Protection Act 1994* (the Act) on 15 December 2021 and the subsequent submissions made by CS Energy Limited (CS Energy).

The submissions included a Contaminated Land Investigation Document (CLID) submitted on 7 September 2022 pursuant to Requirement 5 of the EE. The CLID identified data gaps in section 13.2 which require further investigation to meet the requirements of the EE.

The department acknowledges CS Energy's early engagement and, following a meeting with CS Energy representatives on 28 September 2022, considers it appropriate to amend the EE notice. The amendment will allow CS Energy additional time to complete the investigations required to address the identified data gaps.

To meet Requirement 8 of the EE, CS Energy is required to submit an addendum report which will address the data gaps identified in section 13.2 of the CLID. This addendum report will supplement the previously submitted CLID and both documents will be considered the submission of a 'final environmental report' as required by the EE.

Please find attached your amended notice, which replaces the previous notice issued 15 December 2021. The amended notice provides an extension of time until **5:00pm 13 October 2023** for submission of the 'final environmental report' under Requirement 8.

Notice

Environmental Protection Act 1994

Environmental Evaluation

Notice to conduct or commission an environmental evaluation

This notice to conduct or commission an environmental evaluation is issued by the administering authority pursuant to section 326B of the Environmental Protection Act 1994 *on 15 December 2021. This amended version has been made under section 24AA of the* Acts Interpretation Act 1954.

CS Energy Limited
Level 2, HQ (North Tower) 540 Wickham Street
FORTITUDE VALLEY QLD 4006

Your reference: EPPR00536313 | C-CPLRC-100046232 | E-100046349

Monday, 21 August 2023

Take notice: that under the *Environmental Protection Act 1994* (the Act) this amended notice to conduct or commission an environmental investigation is issued to CS Energy Limited (you) (CS Energy) by the administering authority. The administering authority is the Chief Executive of the Department of Environment and Science (the department).

This amended notice to conduct or commission an environmental investigation is issued in respect of the activities of CS Energy on land described as Lot 1/RP615528 and Lot 4/SP103557 (the premises).

The notice to conduct or commission an environmental investigation was originally issued on 15 December 2021. New text in the amended notice is shown as underlined.

A. Grounds

The notice to conduct or commission an environmental investigation is issued on the following grounds:

1. Under section 326BA of the Act, the department is satisfied on reasonable grounds that:
   (a) particulars of the land are recorded in the environmental management register or contaminated land register,
   (b) the hazardous contaminant contaminating the land is in a concentration that has the potential to cause serious environmental harm or material environmental harm,
   (c) a person, animal or another part of the environment may be exposed to the hazardous contaminant, whether on the land or not.

The facts and circumstances forming the basis for these grounds are:

1) CS Energy hold Environmental Authority EPPR00536313 (the EA) which authorises Environmentally Relevant Activities (ERA):
   - 14 – Electricity Generation, 2: Generating electricity by using a fuel, other than gas, at a rating capacity of, (b) more than 150MW electrical.

Queensland Government

- 08 – Chemical Storage, 1: Storing a total of 50t or more of chemicals of dangerous goods class 1 or class 2, division 2.3 under subsection (1)(a).
- 08 - Chemical Storage, 3: Storing more than 500 cubic metres of chemicals of class C1 or C2 combustible liquids under AS 1940 or dangerous goods class 3 under subsection (1)(c).
- 56 – Regulated Waste Storage, Receiving and storing regulated waste.
- 60 - Waste disposal, 1: Operating a facility for disposing of, in a year, the following quantity of waste mentioned in subsection (1) (a), (d) more than 200,000t.
- 63 – Sewage Treatment, 1: Operating sewage treatment works, other than no-release works, with a total daily design capacity of, (b-ii) more than 100 but not more than 1500EP otherwise.

2) Lot 1/RP615528 and Lot 4/SP103557 are listed on the Environmental Management Register.

3) On 13 August 2019 CS Energy engaged an independent suitably qualified person (**SQP**) under the *Environmental Protection Act 1994* (the Act) to commence investigation works into potential impacts and risks associated with the historical use of aqueous film-forming foam (AFFF) at the premises.

4) On 23 July 2020 CS Energy provided the department with a preliminary site investigation (**PSI)** titled *Preliminary PFAS Environmental Investigation – Callide Power Station* which identified potential onsite risks associated with the historical use of AFFF at the premises. The report recommended completion of an onsite sampling program to quantify potential risks identified, including sampling of surface water, groundwater, soils and sediment.

5) On 1 October 2020 CS Energy provided the department with a sampling analysis and quality plan (**SAQP)** titled *Sampling Analysis and Quality Plan (PFAS) – Callide Power Station* detailing proposed investigation of potential AFFF at the premises and potential migration pathways, targeting groundwater, surface water, soil and sediment.

6) On 17 November 2020 CS Energy notified the department of preliminary PFAS sampling results from the Callide Power Station which indicated that onsite groundwater, surface water, soils and sediments contained varying levels of PFAS contamination, including the detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

7) On 18 December 2020 CS Energy provided the department with a monitoring plan titled *Addendum Monitoring Plan – Callide Power Station SAQP (PFAS)*. The addendum monitoring plan detailed proposed investigation at offsite groundwater and surface water monitoring locations following detection of PFAS in groundwater monitoring wells located along the southern boundary of the premises.

8) On 29 January 2021 CS Energy provided the department with a report titled *Callide Power Station – Targeted PFAS Environmental Investigation* which states 'Historical information available for the site identifies that potential historical use of AFFF at the Callide B and C Power Station site is likely to be less than 1,000L, including use of up to 300L of AFFF concentrate in training activities, system tests and use/maintenance of extinguishers, and a further approximately 500L of AFFF concentrate used in emergency response associated with coal fires at the Coal Plant.

9) The report also stated that 'the most likely potential onsite pathway comprised the potential migration from primary to secondary source areas to offsite receptors including surface waters (Callide Creek,

Dunn Creek and Callide Dam) and fractured rock aquifers located beneath the site (connected to alluvial aquifers and surface water)'.

10) On 4 February 2021 CS Energy notified the department of detection of PFAS exceeding the Australian Drinking Water Guideline (ADWG) for PFOS + PFHxS (0.07 µg/L) in offsite groundwater monitoring wells downstream of the site following implementation of the Addendum Monitoring Plan.

11) On 10 February 2021 CS Energy engaged an approved contaminated land auditor to oversee the implementation of the investigation.

12) On 24 September 2021 CS Energy submitted sampling results to the department which indicated that concentrations of PFOS + PFHxS monitored in 9 onsite groundwater bores were above the ADWG.

13) Sampling results submitted on 24 September 2021 also indicate concentrations of PFOS + PFHxS above the ADWG in private groundwater bores downstream of the site with concentrations up to 0.369ug/L.

14) On 24 September 2021, CS Energy reported that 6 private bores located downstream of the site used for drinking water were being impacted by PFAS contamination above the ADWG levels and that CS Energy was supplying drinking water to 15 households who relied upon these bores for drinking and/or domestic purposes.

15) An environmental value is defined in section 9 of *the Act* as follows:
    a) *A quality or physical characteristic of the environment that is conducive to ecological health or public amenity or safety; or*
    b) *Another quality of the environment identified and declared to be an environmental value under an environmental protection policy or regulation.*

16) Under the Environmental Protection (Water and Wetland Biodiversity) Policy 2019 (Water EPP), all Queensland waters including groundwater and surface waters have prescribed environmental values and water quality objectives. Environmental values and water quality objectives for these waters are listed in schedule 1 of the Water EPP.

17) The groundwater environmental values which apply in the Callide Creek Catchment include drinking water, irrigation, farm water supply, aquatic ecosystem protection, stock water, primary recreation, industrial use and cultural and spiritual values.

18) Groundwater downstream of the site is used by landholders for drinking, domestic, irrigation, farm water supply and stock watering.

19) The groundwater flows through the Callide Creek Aquifer generally in a westerly direction from the premises.

20) Public amenity and safety are environmental values prescribed by the Act, that may be adversely affected by PFAS contamination of groundwater, particularly through contamination of drinking water above the ADWG.

21) Ecological health is an additional environmental value prescribed by the Act that has the potential to be adversely affected by the release of PFAS into the environment, through bioaccumulation in aquatic and terrestrial organisms.

22) PFAS contamination can be environmentally significant due to its persistence, mobility and, for some PFAS, toxicity and potential bioaccumulation in plants and animals (HEPA 2020).

23) Environmental harm is defined in section 14 of *the Act* as follows:

> *(1) Environmental harm is any adverse effect, or potential adverse effect (whether temporary or permanent and of whatever magnitude, duration or frequency) on an environmental value, and includes environmental nuisance.*
>
> *(2) Environmental harm may be caused by an activity—*
>
> > *(a) whether the harm is a direct or indirect result of the activity; or*
> >
> > *(b) whether the harm results from the activity alone or from the combined effects of the activity and other activities or factors.*

24) PFAS contamination has the potential to negatively impact environmental values by a variety of mechanisms including via concentration and accumulation in food stuff, drinking water, contact, ingestion and product usage.

25) Perfluorooctane sulfonate (PFOS) is a compound that is also PFAS.

26) PFAS compounds, including PFOS, are prescribed water contaminants under Schedule 10 of the Environmental Protection Regulation 2019.

27) Based on the facts and circumstances above, the department is satisfied that the contamination of the land and groundwater by PFAS compounds has the potential to cause environmental harm through migration offsite where it is contributing to contamination of groundwater used for drinking water. The environmental value that is primarily adversely impacted is public safety as the contamination of groundwater is above the Australian Drinking Water Guideline.

28) On 28 September 2022, CS Energy representatives attended a meeting with the department to discuss data gaps identified in the Contaminated Land Investigation Document, which was submitted on 7 September 2022. During the meeting timeframes to undertake the additional investigations were discussed. As a result of the meeting the department has determined that the timeframe in Requirement 8 will be amended to allow the further investigations to occur.

29) On 14 August 2023, CS Energy submitted a written request to the department which stated that further works are required to address the data gaps identified in the Land Investigation Document, which was submitted on 7 September 2022. Following a review of the request, the department has amended the timeframe in Requirement 8 to allow the further investigations to occur.

B. Requirements

The report on the environmental investigation must address the following relevant matters:

Where existing investigations have been completed and are relevant to addressing the requirements of this notice, you may use these investigations to address relevant parts of this notice, pending agreement by the SQP and the auditor.

1) **By 5:00 pm on 17 December 2021** you must engage an independent **SQP** under the Act to carry out the requirements of this notice. The SQP must demonstrate skills and experience in technical fields such as soil and groundwater contamination assessment and with particular skills relevant to AFFF firefighting foams containing PFAS.

~~2)~~ **By 5:00 pm on 17 December 2021** you must engage an approved contaminated land auditor to undertake an auditor's function as outlined in Section 568(b) of the Act, to oversee the SQP carrying out the requirements of this notice.

3) **By 5:00 pm on 28 February 2022** you must develop and submit a sampling, analysis and quality plan (**SAQP**) to the department to characterise the potential source and extent of PFAS contamination likely to be caused from the release of AFFF at the premises for the purpose of preparing a site investigation report as defined in section 387 of the Act. This plan must be prepared by a SQP and consented to by a contaminated land auditor.

   This investigation detailed in the SAQP must, as a minimum:
   a) evaluate the nature and extent of PFAS contamination likely to have been caused by any direct or indirect release of AFFF from the premises to soil, water, groundwater, sediments and, include biota sampling in Callide Creek adjoining the premises as part of the investigation; and
   b) assess likely pathways of PFAS contamination from the release of AFFF from the premises including, but not limited to, the premises, surface waters, drainage lines, stormwater infrastructure and groundwater in the vicinity of the premises; and
   c) assess the nature of the connectivity/completeness of those likely pathways by, assessing (where applicable) groundwater levels versus surface water levels and connectivity, hydraulic conductivity and groundwater velocity, and evaluate the potential for surface water releases from Callide dam to enhance migration of PFAS contaminants from the site.
   d) the sampling analysis must be generally in accordance with all requirements stated in **Requirement 7**.

4) **By 5:00 pm on 7 March 2022** you must commence sampling and analysis in accordance with the SAQP required by Requirement 3.

5) **By 5:00 pm on 7 September 2022** you must submit a contaminated land investigation document (**CLID**) in accordance with the content requirements of section 389 of the Act, that is a site investigation report detailing the findings of the sampling, analysis and quality plan to determine the nature and extent of impact arising from any direct or indirect release of any hazardous PFAS contaminants from the release of AFFF.

   The CLID must also include, but is not limited to the following:
   a) Evaluate known historical activities undertaken at the premises which has involved the use, storage (including volume), handling, foam types and potential release of AFFF PFAS containing material;
   b) Provide analytical data that characterises the nature of the PFAS at the premises and that which has been released or potentially released to assist in determining the nature and extent of PFAS contamination in the receiving environment;
   c) Provide analysis of potentially affected media including soil, sediment, surface water, groundwater and biota and identify potential pathways for impacts to human and biota receptors;

d) Provide all monitoring results and an analysis of the extent of PFAS contamination in soils, sediment, surface water, groundwater and biota;
e) Assess the potential for environmental harm (actual or potential) and provide recommendations for the implementation of reasonable and practicable options to prevent or minimise any further releases of PFAS from identified sources and manage and monitor environmental and human health risks; and
f) Provide remediation options to remove the contamination and treat the contamination taking into account the extent of any residual contamination in soils, sediment, groundwater and surface waters that affect the premises or other receptors.

6) The investigations required by this notice must meet the requirements for a CLID for the land in accordance with section 389 and 390 of the Act. A CLID must be prepared by a SQP as required by and in accordance with Chapter 12, Part 3 of the Act and be accompanied by an auditor certification that the CLID complies with section 389(1) and (2) of the Act.

7) You must ensure that the following requirements, to the extent that they are applicable and specified requirements are not otherwise referred to, are met when conducting the investigation and preparing the report:

a. The investigation is conducted in accordance with the following:
   i. *the Act* – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/act-1994-062;
   ii. The Policy – see https://www.legislation.qld.gov.au/view/pdf/inforce/current/sl-2019-0156;
   iii. Queensland Water Quality Guidelines (2009) – see https://environment.des.qld.gov.au/management/water/quality-guidelines;
   iv. Monitoring and Sampling Manual 2018 Environmental Protection (Water) Policy 2009 Version 2 June 2018 see - https://environment.des.qld.gov.au/__data/assets/pdf_file/0031/89914/monitoring-sampling-manual-2018.pdf;
   v. National Environmental Protection (Assessment of Site Contamination) Measure 1999 – see http://nepc.gov.au/nepms/assessment-site-contamination;
   vi. Queensland Auditor Handbook for Contaminated Land – see https://www.qld.gov.au/environment/pollution/management/contaminated-land/auditors/auditor-handbook;
   vii. Assessment of impact of human health considering the Tolerable Daily Intakes for PFOS, PFOA, and PFHxS recommended by Food Standards Australia New Zealand (FSANZ);
   viii. Where PFAS are encountered in water bodies at the premise which are accessible to fauna such as birds and mammals, qualitative consideration of water to animal bioaccumulation factors reported in research publications concerning those contaminants in evaluating potential environmental harm to such animals; and
   ix. Assessment of contamination considering guidance provided in the PFAS NEMP – see https://www.qld.gov.au/environment/pollution/management/disasters/investigation-pfas/management-plan.
b. An assessment of edible portions (biota) must be used in estimating risks of exceeding the tolerable daily intakes, being consistent with the Queensland Health Guideline for sampling and analysis of seafood suitable for human health risk assessments of PFAS contamination (see

https://www.qld.gov.au/__data/assets/pdf_file/0032/68684/pfas-fish-sampling-protocol.pdf) and adopting portion sizes recommended by Food Standards Australia New Zealand (FSANZ) in addition to assessment of whole species (biota) to evaluate bioaccumulation risk; and

c. Wherever practical, all samples must be analysed by a NATA accredited laboratory (it is noted that in biota sampling this may not be applicable); and
d. The analytical data on all media (soil, sediment, water, groundwater and biota) must include results for sampling to determine total organic fluorine, total oxidisable precursor (TOP) assay, and the suite of 20 to 28 standard fluorinated organic compounds by liquid chromatography-mass spectrometry (LC/MS/MS) available from commercial laboratories reported as the analyses for the resulting perfluorinated carboxylates for C4 to C14 carbon chain length (TOP C4-C14); and
e. Note that as analytical and instrumental improvements are made regarding the analysis for PFAS it is understood that some laboratories are increasing the standard suite which may assist you in distinguishing between the premises sources of PFAS and other potential sources; and
f. Where TOP Assay is performed, quality assurance checks must include that oxidant exhaustion has not occurred (e.g. reanalysis to determine presence of fluorotelomer); and
g. Groundwater bores are constructed in accordance with the Minimum Construction Requirements for Water Bores in Australia (4th edition).

8) **By 5:00 pm on 8 March 2024** you must submit a final environmental report to department that demonstrates that the requirements of this environmental evaluation have been completed.

The environmental investigation must be carried out, and the environmental report prepared by a suitably qualified person. A suitably quality person is defined as a person who has professional qualifications, training, skills or experience relevant to the Environmental Evaluation requirements, and can give authoritative assessment, advice and analysis in relation to the Environmental Evaluation using relative relevant protocols, standards, methods or literature.

As the recipient of this notice, you are also required to provide a statutory declaration in the form attached, to accompany the environmental report submitted to the department.

The suitably qualified person who prepares the environmental report and the contaminated land auditor must also provide a statutory declaration in the form attached to the environmental report submitted to the department.

Copies of the template statutory declarations can also be accessed from the Queensland Government website at www.qld.gov.au, using the publication number as a search term:

1. Statutory declaration environmental evaluation for recipient (ESR/2016/1997)
2. Statutory declaration for suitably qualified person (ESR/2016/2266)
3. Statutory declaration for auditor (ESR/2016/2265)

Take notice:

1. The requirements of the notice to conduct or commission an environmental investigation take effect immediately upon service of this notice;
2. This notice remains in force until further notice from the department; and

3. You are responsible for meeting the costs of conducting or commissioning the environmental evaluation, preparing the environmental report and providing any further information as requested by the department.

C. Reviews and appeals

The provisions regarding reviews of decisions and appeals are found in sections 519 to 539 of the Act.

A person who is dissatisfied with certain decisions of the department, may be able to apply to have the department review that original decision.

Generally, a request to have a decision reviewed must:

- be made within 10 business days of the decision being notified to the person;
- be supported by enough information to enable the department to decide the application for review; and
- be made using the application form, Application for review of original decision (ESR/2015/1573) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1573) as a search term.

Where an application has been made for a decision to be reviewed, the applicant may also apply to the relevant court for a stay of the decision to secure the effectiveness of the review.

Once the original decision has been reviewed, a person who is dissatisfied with the review decision may be able to appeal against that decision to the relevant court within 22 business days after receiving notice of the review decision.

A person whose interests are or would be adversely affected by a decision of the department may also be able to request a statement of reasons for a decision or a statutory order review under the *Judicial Review Act 1991*.

For further information about reviews and appeals see the information sheet, Internal review and appeals (ESR/2015/1742) available on the Queensland Government website at www.qld.gov.au, using the publication number (ESR/2015/1742) as a search term.

The information sheets are available on the Queensland Government website at www.qld.gov.au, using the publication number as a search term.

You may have other legal rights or obligations and should seek your own legal advice.

D. Penalty

Failure to comply with a notice to conduct or commission an environmental evaluation is an offence.

1. The maximum penalty for an individual is 300 penalty units.
2. The maximum penalty for a corporation is 1500 penalty units.

Should you have any queries in relation to this notice, please contact Joshua Radloff, Principal Environmental Officer on (07) 4971 6509 or email cwes_gladstone@des.qld.gov.au.

C S ENERGY LIMITED
LEVEL 12, 31 DUNCAN STREET
FORTITUDE VALLEY QLD 4006

NOTICE OF LAND LISTED ON THE ENVIRONMENTAL MANAGEMENT REGISTER

In accordance with section 378 of the *Environmental Protection Act 1994 (EP Act)* notice is given that the parcel of land described below has been listed on the Environmental Management Register (EMR).

Lot: 1 Plan: RP615528
BANANA SHIRE COUNCIL

959 BILOELA CALLIDE ROAD
MOUNT MURCHISON QLD 4715

The parcel of land has been recorded on the EMR as, after careful consideration of any submissions, it is decided that the land has been affected by a hazardous contaminant. Details of the listing are provided below.

HAZARDOUS CONTAMINANT - This site has been subject to a hazardous contaminant. Refer to the summary given below.

- Asbestos materials found:
  Chrysotile Asbestos & Organic Fibres Detected, Amosite Asbestos Detected, Synthetic Mineral Fibres Detected.

The above details have been added to the particulars of the land already recorded in the EMR which are listed below:

CHEMICAL STORAGE - (other than petroleum products or oil under item 29) – storing more than 10t of chemicals (other than compressed or liquefied gases) that are dangerous goods under the dangerous goods code.

COAL FIRED POWER STATION – operating a coal fired power station.

PETROLEUM PRODUCT OR OIL STORAGE - storing petroleum products or oil -
(a) in underground tanks with more than 200L capacity; or
(b) in above ground tanks with -
(i) for petroleum products or oil in class 3 in packaging groups 1 and 2 of the dangerous goods code - more than 2, 500L capacity; or
(ii) for petroleum products or oil in class 3 in packaging groups 3 of the dangerous goods code - more than 5, 000L capacity; or
(iii) for petroleum products that are combustible liquids in class C1 or C2 in Australian Standard AS1940, 'The storage and handling of flammable and combustible liquids' published by Standards Australia - more than 25, 000L capacity.

WASTE STORAGE, TREATMENT OR DISPOSAL - storing, treating, reprocessing or disposing of regulated waste (other than at the place it is generated), including operating a nightsoil disposal site or sewage treatment plant where the site or plant has a design capacity that is more than the equivalent of 50,000 persons having sludge drying beds or on-site disposal facilities.

The owner may apply for a review of the decision to record the land in the EMR within 10 business days after receipt of this notice, in accordance with section 521 of the EP Act.

A landowner dissatisfied with a review decision may appeal against the decision in accordance with section 531 of the *EP Act.*

For further information about contaminated land matters visit www.qld.gov.au, and search for "contaminated land".

SEARCH RESPONSE
ENVIRONMENTAL MANAGEMENT REGISTER (EMR)
CONTAMINATED LAND REGISTER (CLR)

Transaction ID: 50805449 EMR Site Id: 30829 05 September 2022
This response relates to a search request received for the site:
Lot: 4 Plan: SP103557

EMR RESULT

The above site IS included on the Environmental Management Register.
Lot: 4 Plan: SP103557
Address: COAL ROAD
BILOELA QLD 4715

The site has been subject to the following Notifiable Activity or Hazardous Contaminant.
ASBESTOS MANUFACTURE OR DISPOSAL -
(a) manufacturing asbestos products; or
(b) disposing of unbonded asbestos; or
(c) disposing of more than 5t of bonded asbestos.
CHEMICAL STORAGE - (other than petroleum products or oil under item 29) - storing more than 10 t of chemicals (other than compressed or liquefied gases) that are dangerous goods under the dangerous goods code.
COAL FIRED POWER STATION - operating a coal fired power station.
PETROLEUM PRODUCT OR OIL STORAGE - storing petroleum products or oil -
(a) in underground tanks with more than 200L capacity; or
(b) in above ground tanks with -
(i) for petroleum products or oil in class 3 in packaging groups 1 and 2 of the dangerous goods code - more than 2, 500L capacity; or
(ii) for petroleum products or oil in class 3 in packaging groups 3 of the dangerous goods code - more than 5, 000L capacity; or
(iii) for petroleum products that are combustible liquids in class C1 or C2 in Australian Standard AS1940, 'The storage and handling of flammable and combustible liquids' published by Standards Australia - more than 25, 000L capacity.
WASTE STORAGE, TREATMENT OR DISPOSAL - storing, treating, reprocessing or disposing of regulated waste (other than at the place it is generated), including operating a nightsoil disposal site or sewage treatment plant where the site or plant has a design capacity that is more than the equivalent of 50, 000 persons having sludge drying beds or on-site disposal facilities.

CLR RESULT

The above site is NOT included on the Contaminated Land Register.

ADDITIONAL ADVICE

All search responses include particulars of land listed in the EMR/CLR when the search was generated.
The EMR/CLR does NOT include:-

1. land which is contaminated land (or a complete list of contamination) if DES has not been notified
2. land on which a notifiable activity is being or has been undertaken (or a complete list of activities) if DES has not been notified

If you have any queries in relation to this search please email emr.clr.registry@des.qld.gov.au

Callide Power Station Environmental Evaluation

Figure F8
Generalised Conceptual Site Model

PFAS migration from onsite source areas via surface water.

- Historical mass of PFAS in AFFF released to ground estimated to be 16.2kg
- Residual mass of PFAS in soils (areas of AFF use estimated to be 3-4kg
- Approximately 1.3kg PFAS chemically stabilised at fire training ground and fuel oil tanks (reduction in leachability >99.7%)

Onsite movement of surface water within Waste Containment Facility

- Residual PFAS mass in onsite surface water estimated to be 0.1—0.6 kg

Surface water from mine area

- Diverted around Waste Containment Facility
- Discharges to Callide Creek, with some infiltration to Alluvial Aquifer
- PFAS mass unknown

Downstream PFAS migration along Callide Creek (surface water)

- Surface water combines with Kroombit Creek (approximately 28 km downstream of CPS) and discharges to the Don River (approximately 60 km downstream of CPS)
- Mass of PFAS historically released downstream (beyond Jambin Dakenba Rd) via surface water flow unknown

Shallow Seepage (surface water)

- Collected as surface water and returned to Waste Containment Facility (occasional licenced release)

PFAS migration along Callide Creek (surface water)

- When water levels in the aquifer are low (deep) surface water will infiltrate to groundwater.
- When water levels in the aquifer are high (shallow) surface water will continue to downstream catchment.
- Groundwater may discharge to surface water when water table high (aquifer full)

APPENDIX F DQOS AND QA/QC DISCUSSION

DATA QUALITY OBJECTIVES

Establishing DQOs

The DQO process consists of seven iterative steps, which are designed to clarify the specific project objectives, define the appropriate type of data and inputs required and specify tolerable levels of potential decision errors.

Depending on the intended use of the data, there are two types of DQOs:

- Decision making problems – which are addressed by performing statistical hypothesis tests on the collected data
- Estimation problems – which involve using the collected data to estimate some unknown population parameter together with some reported measure of uncertainty in the estimate

These DQOs are estimation DQOs, and the seven steps and associated planning process output is detailed in **Table I2**. A summary of the DQO planning process is outlined below**:**

- Step 1 of the DQO process aims to define the problem that has initiated the study by stating the problem
- Step 2 of the DQO process aims to define the problem that has initiated the study by identifying the goal of the study. Details associated with Step 2 are presented below.
- Step 3 of the DQO process aims to identify the information that will be required to support the decision and specify which inputs require new environmental measurements.
- Step 4 of the DQO process aims to define the spatial and temporal boundaries that the data must represent to support the decisions. Details associated with Step 4 are presented in the table below.
- Step 5 of the DQO process aims to define the statistical approach by developing a logical "if …, then …, else …" statement that defines the conditions that would cause the decision maker to choose among alternative actions.
- Step 6 of the DQO process aims to specify probability limits for false rejection and false acceptance decision errors.
- Step 7 of the DQO process aims to identify a resource effective sampling and analysis design for generating data that are expected to satisfy the DQOs.

Identification details for the establishment of the DQOs are outlined in **Table I1.**

Table I1. DQO Details

Aspect	Detail
Project:	Callide Power Station - PFAS Environmental Investigation
Field work stage:	PFAS Environmental Investigation (Environmental Evaluation)
Preparation of DQOs	Luke Amies
Review of DQOs	Grace Perkins
DQO Background	A Notice to conduct or commission an EE was issued by DES on 15 December 2021 requiring CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site. Following submission of the initial EE environmental investigation report (initial CLID, Epic, 2022c), a meeting was held with DES to discuss the seven remaining data gaps identified and agree on a timeframe to complete additional investigation required to address the data gaps. Correspondence received by DES on 4 October 2022 requested CS Energy complete additional works and provide an addendum report By 5:00 pm on 8 March 2024.
DQOs objective:	The DQO objectives is to answer the principal study questions detailed in Step 2 which aims to assess the nature and extent of potential impacts associated with any direct or indirect release of PFAS contaminant, associated with historical use of AFFF at the site.

Table I2. DQO Planning Process

Aspect	Detail
STEP 1 *Describe the problem, develop a conceptual model of the environmental hazard to be investigated, and identify the general type of data needed.*	• PFAS was detected within groundwater and surface water at the site boundary and in downstream monitoring locations up to approximately 10 km downstream of the site, with some locations reported to exceed the Australian Drinking Water Guideline for PFOS + PFHxS. • DES issued an EE notice requiring CS Energy to commission an environmental investigation to determine the nature and extent of impact arising from any direct or indirect release of PFAS from the historical use of AFFF at the site. • As part of the EE site investigation works completed to date, PFAS has been identified in AD4 and in the Callide A NSP. The source, extent and nature of these detections were not able to be determined, requiring additional data to be collected. • PFAS in groundwater and surface water bodies were identified across the investigation area, requiring additional investigation be completed to facilitate an update to the PFAS flux model across the site.
Establish the planning team and identify the team's decision makers.	• Works are to be undertaken by a Suitably Qualified Person (SQP) in accordance with the requirements of the EE Notice. Details on the project team are outlined in **Section 1.3.**
Develop/refine the conceptual site model (CSM).	• A summary of the site wide CSM is detailed in the initial CLID (Epic, 2022c)
Define the exposure scenarios.	• PFAS is extremely soluble and highly mobile in water, consequently surface water and groundwater flow are important transport mechanisms for PFAS compounds. Potential water flow and contaminant transport from the site to the surrounding environment was likely dominated by surface water and groundwater flows. • The primary exposure pathways associated with human health was ingestion, associated with primary surface water and groundwater pathways (including drinking water) and secondary pathways through the consumption of impacted produce and biota. Ingestion of impacted media, and to a lesser extent dermal contact and inhalation pathways, were considered to be limited.
Discuss alternative approaches to investigation and solving the problem.	• A notice to conduct or commission an environmental investigation was issued in accordance with Section 326B of the Environmental Protection Act 1994. All works detailed in the EE and the subsequent amended notice are required to be completed.
Identify available resources, constraints, and deadlines associated with planning, data collection, and data assessment.	• A CLID (site investigation report) was prepared to address the requirements of the initial EE and delivered to DES on 7 September 2022 • Based upon the identification of data gaps (**Table 3**) an extension was issued by DES with the final EE CLID required for delivery to DES by 1700 on 13 October 2023 • It is noted that multiple investigations have been completed or are currently ongoing to address the full requirements of the EE (detailed in **Table 3**). Further to this, several aspects relevant to the EE are to be completed outside of investigations detailed in the SAQP.

STEP 2
Identify the principal study question(s).
	• The principal study questions for this sampling plan are:
	  • What is the source of PFAS detected in AD4 (Data Gap 1) and at Callide A within the NSP Catchment (Data Gaps 2 and 3)
	  • What is the nature and extent of PFAS contamination at the site, including areas identified to comprise an existing data gap
	  • What are the likely pathways associated with PFAS contamination at the site to other areas of the site, surface waters, drainage lines, stormwater infrastructure and groundwater (Data Gaps 4, 5 and 6)?
	  • For pathways identified, what is the nature of the connectivity/completeness of these pathways and relative contribution to site mass flux of PFAS?
	  • What are the potential risks to human and ecological health including aquatic biota

Define alternative actions that may be taken based upon the range of possible outcomes that result from answering the principal study question.	• Where data gaps are unable to be resolved, further investigation to be completed to inform and close out relevant gaps • Where PFAS contamination has been identified at the site, options for remediation / management can be established. • Where environmental harm is not identified ongoing monitoring of relevant media can continued in accordance with site licencing requirements and included identification and reporting (if required) of any trends or changes in site conditions.
Combine the principal study question and the alternative actions into a decision statement.	• If investigations are unable to close identified data gaps, further investigation will be completed to be completed to inform and close out relevant gaps. • If investigations indicate that direct or indirect releases of AFFF resulted in measurable impact to soil, sediment, surface water, groundwater and/or biota, actions required to prevent or minimise any further releases of contaminants and options for remediation of impacts will be required to be established. • If investigations indicate that direct or indirect releases of AFFF have not resulted in measurable impacts to soil, sediment, surface water, groundwater and/or biota, the previously developed CSM (Epic, 2022c) will be reviewed and updated, with further recommendations made where applicable in the main report.
Organize multiple decisions into an order of sequence or priority.	N/A

STEP 3 *Identify the information that will be required to resolve the decision statement and determine the sources for each item of information identified.*	The following existing information was utilised in resolving the decision statement: • Information on current and historical site activities as detailed in **Section 2** and the completed CLID (Epic, 2022c). • Results from previous PFAS investigations completed at the site summarised in the CLID (Epic, 2022c). • Hydrogeological information available for the site and receiving environments detailed in the CLID (Epic, 2022c). • Groundwater and surface water levels, chemistry, connectivity, hydraulic conductivity and velocity. • Review of the representativeness of monitoring locations to assess potential sources along with potential impacts to identified receptors. • Review of GHD (2022) investigation into the integrity of Ash Dam 2. New/Additional Information: • Identification of all potentially impacted media (including groundwater, surface water, soil) within the nominated study boundary • Update of potential pathways between potentially impacted media and human and ecological receptors • Confirmation of PFAS contamination through sampling and analytical testing by a NATA accredited laboratory (as applicable) to be completed on all media for PFAS (standard suite of 28) to the lowest laboratory limit or reporting • Leachability assessment of soil and sediment samples (as applicable) • Analysis of samples for additional laboratory analytical methods including physicochemical parameters and cations/anions to enable comparison of and between aquifers and surface water bodies • Potential impacts/contributions from adjacent land uses including groundwater and surface water impacts from the Callide Mine and surface water releases from Callide Dam • Sampling and analysis of aquatic biota within Callide Creek and associated waterways

Identify the information needed to establish the action level.	The adopted action levels were detailed in the original SAQP (Epic, 2022b) and was based on environmental guideline values detailed within the following guidelines:
	• PFAS NEMP, including
	  • Table 1. Human health guideline values
	  • Table 2. Human health investigation levels for soil
	  • Table 3. Ecological guideline values for soil
	  • Table 4. Biota guideline values
	  • Table 5. Ecological water quality guideline values (freshwater)
	• NHMRC Guidance on Per and Polyfluoroalkyl substances (PFAS) in Recreational Water (2019)

Confirm that appropriate analytical methods exist to provide the necessary data.	Proposed analytical testing and detection limits will be consistent with the previous sampling events. Laboratory analysis will be completed by Australian Laboratory Services (ALS) (primary laboratory) and Eurofins MGT (Eurofins) (secondary laboratory). Both laboratories are NATA accredited for the analytical testing proposed. All analytical procedures used by the laboratories were in accordance with established internationally recognised procedures such as those published by the United States Environmental Protection Agency (USEPA), American Public Health Association (APHA) and relevant Australian Standards/New Zealand Standards (AS/NZS).

STEP 4 *Specify the characteristics that define the population of interest.*	Onsite investigations will be limited to within Lots 1 RP615528 and 4 SP103557 which form the current Callide Power Station site. Areas of interest for this supplementary investigation includes: • Callide A • AD4 • Seepage recovery areas adjacent to Ash Dam B Offsite investigation areas include areas immediately surrounding the boundaries of the site and included areas within Dunn Creek and Callide Creek. Investigation areas along the alignment of Callide Creek will continue to include public and private lands extending to Jambin Dakenba Road, approximately 10 km west of the site. Aquatic biota sampling will be completed within Callide Creek (including Callide Dam and upstream areas), with reference sampling to be completed within Kroombit Dam (adjacent catchment).

Define the geographic area and media to which the decision statement applies.	• Assessment of groundwater was limited to existing groundwater monitoring and abstraction wells including:
	  • CS Energy groundwater monitoring wells
	  • Department of Regional Development, Manufacturing and Water (DRDMW, formerly DRNME) monitoring wells
	  • Private groundwater abstraction bores
	• Assessment of surface water will be limited to existing onsite surface water bodies along with areas of Callide Creek and Dunn Creek within the investigation area
	• Assessment of soil (including ash) will be limited to Callide A and AD4 within the boundaries of the site
	• Aquatic biota sampling will be completed within Callide Creek (including Callide Dam and upstream areas), with reference sampling to be completed within Kroombit Dam (adjacent catchment)

When appropriate, divide the populations into strata that have relatively homogenous characteristics.	• Assessment of groundwater will target the uppermost aquifer identified beneath the site. • Assessment of surface water will include onsite water bodies and existing environmental monitoring locations within Callide and Dunn Creeks. These will then be divided based upon onsite catchments. • Assessment of soil will target both fill and natural soil profiles. Investigation will not be completed within underlying rock profiles. • Aquatic biota sampling will be completed in accordance with the existing Sampling Plan, targeting species of different trophic levels to inform risks to human and ecological health.
Determine the time frame to which the decision applies.	The findings of the proposed SAQP addendum works will be required to be submitted 13 October 2023 (EE Requirement 8).
Determine when to collect data.	Implementation of this SAQP will be undertaken as a number of separate monitoring/sampling events. It should be noted that some scopes of works had already commenced or are a continuation of the previous SAQP program (prior to issue of the SAQP), including aquatic biota sampling.
Define the scale of the decision making.	The results collected during investigation, in addition to previous information determined to be appropriate, will inform the principal study questions nominated above, and determined whether further works/actions are required to be completed.
Identify any practical constraints on data collection.	Data collection will be limited by a number of factors including: • Site operational considerations which could limit access to monitoring locations, including exclusion zones and existing above and below ground infrastructure. • Access to monitoring locations can be limited due to weather or natural events including rainfall/flooding or storms. • Subsurface conditions could limit the vertical extents of the investigation (refusal on rock). • Potential travel restrictions associated with public health orders.

STEP 5 *Specify the statistical parameter that characterises the population of interest, such as mean, median, maximum or proportion, etc.*	Analytical results will be compared against the adopted assessment criteria to provide an indication of whether potential or actual environmental harm could occur. In addition, analytical results will be utilised to enable comparison of and between soil, sediment, groundwater and surface water (where applicable) to assess representativeness and reliability of monitoring locations along with potential linkages between media. To ensure statistically significant data sets account for seasonal/temporal variations, additional assessment works will be completed from existing established monitoring locations. Data collected from established monitoring locations will result in a more statistically robust data set, with new locations sampled to provide preliminary/indicative information to inform potential sources and/or impacts.
Specify the action level for the decision.	Analytical results will be compared against the adopted assessment criteria. It should be noted that in accordance with the NEMP, a higher level of protection has been adopted (i.e. 99% species protection for slightly-moderately disturbed systems instead of 95% species protection) due to the bioaccumulative nature of PFAS, in the absence of biota sampling (scheduled to be completed early 2023) and completion of a site specific detailed risk assessment. Field QA/QC will be completed in accordance with the proposed QA/QC plan as outlined in **Appendix F**.
Confirm that measurement detection will allow reliable comparisons with the action level.	All analysis will be completed to the lowest practicable limit of reporting (LOR). Analysis of groundwater and surface water will be completed using Super-Ultra Trace methods (0.0002-0.0005 µg/L) to achieve LORs below the 99% Species Protection limits. It is noted that some samples reported elevated LORS due to sample turbidity which is expected to continue through future sampling events.
Combine the outputs from the previous DQO steps and develop a decision rule.	If laboratory results report concentrations above the adopted assessment criteria, then, further assessment will be completed to determine the nature and extent of any impact (where it was not already defined). If field and laboratory QA/QC data report results within acceptable ranges, then, analytical data will be considered suitable for interpretative use.
STEP 6 *Specify the decision rule as a statistical hypothesis test.*	The Null hypothesis (HO) is that that concentrations of PFAS associated with the direct or indirect release of AFFF resulted in concentrations that exceeded the adopted assessment criteria and/or has resulted in environmental harm. The Alternative hypothesis (HA) will be that concentrations of PFAS are below the adopted assessment criteria and/or have not resulted in environmental harm.
Examine consequences of making incorrect decisions from the test.	False rejection or Type I error of determining the site is not causing environmental harm when it is (wrongly rejects a true HO). Consequence will be potential risks and ongoing harm to human health and/or the environment. False acceptance or Type II error of determining the site is causing environmental harm when it is not (wrongly accepts a false HO). Consequence is unnecessary expenditure and implementation of actions to prevent or minimise further harm and/or manage identified risks.

Place acceptable limits on the likelihood of making decision errors.	The acceptable limits on decision errors will be applied for the implementation of these works, and the manner of addressing possible decision errors are to be developed based on the Data Quality Indicators (DQIs) of precision, accuracy, representativeness, comparability and completeness. The potential for significant decision errors will be minimised by: • Assessing whether appropriate sampling and analytical density and representativeness are achieved • Completing a robust QA/QC assessment of the field and laboratory data and application of the probability that 95% of data that satisfied the DQIs, therefore a limit on the decision error will be 5% that a conclusive statement may be incorrect • Ensuring the assessment criteria adopted is appropriate • Sufficient mass/volume of sample media is collected to achieve the lowest possible LORs • Laboratories holding NATA accreditation are used for the analytical methods adopted • The potential for significant decision errors are to be minimised by completing a robust QA/QC program and an environmental assessment that has an appropriate sampling and analytical density for the purposes of the assessment in which representative sampling was undertaken and appropriate sampling methodologies which are to be employed by trained and experienced field personnel
STEP 7 *Document the final sampling and analysis design, along with a discussion of the key assumptions underlying this design.*	Details of the identified data gaps are detailed in **Section 1.2**, with details and justification of proposed sampling detailed in the Addendum SAQP (Epic, 2023a).
Detail how the design should be implemented, together with contingency plans for unexpected events.	Details of the of the proposed sampling and analysis design are detailed in the Addendum SAQP (Epic, 2023a).
Determine the quality assurance and quality control (QA/QC) procedures that would be performed to detect and correct problems to ensure defensible results.	QA/QC procedures which are to be adopted for field and laboratory aspects are outlined in **Appendix F**.
Document the operational details and theoretical assumptions of the selected design in the sampling, analysis and quality plan (SAQP).	Operational details and design elements are detailed in the Addendum SAQP (Epic, 2023a). These are taken from the SAQP prepared for the initial phases of the project (Epic, 2022b)

Field Quality Assurance and Quality Control

The Quality Assurance and Quality Control (QA/QC) protocols to be used during remediation and validation works are shown in (**Table I3**) below.

Table I3: Field QA/QC

Protocol	Description
Sampling Team	Fieldwork was completed by suitably qualified Epic Environmental consultants. Site personnel comprised only professionally qualified environmental scientists and engineers experienced in undertaking soil sampling programs.
QA/QC System	All field actives, sampling and analysis was conducted in accordance with the Epic Environmental Sampling Plan.
Chain of Custody Protocols	All samples were logged and transferred under a completed Chain of Custody Forms.
Preservation	All samples were received at the laboratory in appropriately preserved containers, with preservation including packing samples with ice packs and eskies.
Blind Field Duplicates	Split samples were prepared in accordance with procedures given in Australian Standard AS4482.1-2005 and the NEMP. The frequency of duplicate testing corresponded to at least 10% of samples.

Field Duplicates

The RPD calculations for duplicate samples have been compared against the relevant primary sample. Where either primary or duplicate results have concentrations below laboratory level of reporting, the RPD as not calculated. Field duplicates were collected as part of works detailed in the SAQP (Epic 2023a).

A total of 25 water duplicate pairs (intra-laboratory and inter-laboratory duplicates) were collected for a total of 247 primary groundwater and surface water samples collected during the additional investigations. One soil duplicate pair was collected for a total of 21 primary samples collected from Callide A during the additional investigations, however a total of 5 sets of duplicate pairs have been collected for a total of 45 primary samples collected from Callide A across all investigations. Three duplicate pairs were collected for a total of 26 primary samples collected from Ash Dam 4 during the additional investigations.

Collection and analysis of field duplicates is considered to comply with the DQO of 1 duplicate sample per 10 primary samples, and as such it is considered that investigation and validation results are suitable for interpretive use. It is noted that results from an additional 28 groundwater samples collected by GHD and 36 surface water samples collected by CS Energy (generally comprising opportunistic sampling) have been included for information purposes, with duplicate samples not collected during these sampling events.

A number of RPDs were found to be above the data quality indicators (DQI) for relative percent differences (30%), with exceedances and RPD Calculations presented in the tables included at the end of **Appendix K**. On review, the RPD exceedances for PFAS analytes in water are generally considered to be a result of small differences in concentrations approaching the laboratory's LOR (i.e. within 10 times the LOR), producing high RPDs not reflective of data errors, differences in laboratory methods and heterogeneity of soil/sediment materials observed in soil investigation samples. In general, RPDs for PFAS analytes in water were reported below 100% indicating that variance between samples was not significant.

The primary and duplicate concentrations for all remaining analytes tested were either below the laboratory LOR, or within the acceptable RPD range. On this basis, RPD exceedances are not considered significant in terms of data quality.

Rinsate Blanks

Where reusable sampling equipment was employed, decontamination occurred between sample locations. Rinsate samples were periodically collected (at least once per sampling event) from decontaminated equipment.

A total of 18 rinsate blanks were collected during additional investigation sampling, with rinsate blanks collected from non-disposable/dedicated field equipment including the interface meter. All rinsate blanks reported concentrations below the laboratory's LOR. It is noted that non-dedicated equipment included:

- Groundwater interface meter
- Submersible electric pump
- Surface water sampling pole

On this basis, decontamination procedures utilised are considered to have been adequate.

Field Blanks

A total of 20 field blanks were collected throughout the sampling program. The field blanks were prepared in the field by decanting laboratory prepared rinsate waters into laboratory supplied containers under normal field sampling conditions. Field blanks were collected at least once per sampling event to assess potential cross contamination during sample collection. All field blanks reported concentrations below the laboratory's LOR.

Field QA/QC Review

Review of field QA/QC methods has been undertaken to confirm compliance with the project DQOs, with results summaries in **Table I4**. Items found to be non-compliant are further discussed in the sections below.

Table I4: Validation Data Quality Objectives (DQOs)

DQO	Evaluation Criteria	Review/Comment
Document Completeness	Completion of field calibration records, field notes, chain of custody documentation, laboratory test certificates from NATA- certified laboratories	▪ Chain of custody (COC) and relevant laboratory documentation complete and included in **Appendix K**. ▪ Laboratories NATA approved for requested analysis. ▪ Field calibration records complete with certificates included in **Appendix H**.
Data Completeness	Sampling density is completed in accordance with the approved methodology to address the areas of concern	▪ Sampling completed in accordance with the SAQP.
Data Comparability	Use of appropriate techniques for the sampling, storage and transportation of samples Use of NATA certified laboratory using NEPM 2013 procedures	▪ Sampling completed using approved techniques. Discussion of groundwater sampling methodologies detailed below ▪ Review of groundwater field sheets indicates parameter stabilisation not achieved due to well purging dry in some wells, with sampling completed following recharge. Remaining wells show stabilisation of parameters in accordance with nominated tolerances prior to sampling. ▪ Laboratories NATA approved for requested analysis.

DQO	Evaluation Criteria	Review/Comment
Data Representativeness	Analysis of validation samples in accordance with contaminants of concern as detailed in the SAQP.	▪ All samples analysed for nominated contaminants of concern in accordance with the SAQP
Precision and accuracy for sampling and analysis	Properly trained and qualified field personnel were utilised Blind field duplicates were collected at a minimum rate of 1 in 10 Split field duplicates were analysed at a rate of one per 10 primary samples RPD's (Relative Percent Difference) to be less than 30% Achieve laboratory QC criteria	▪ All works completed by suitably trained and qualified personnel under the supervision of the SQP. ▪ Blind duplicate sampling completed at 1 in 10. Split duplicate sampling completed at rate of 1 in 10 ▪ Review of RPD results indicate results are suitable. ▪ Laboratory QC criteria achieved

Groundwater Sampling Methodology

Groundwater sampling completed as part of the October 2022 to December 2023 monitoring events was completed in accordance with the sampling methods recommended in the groundwater monitoring network review, as detailed in Section 17.1.1 of the initial CLID (Epic, 2022c).

Laboratory Quality and Assurance and Quality Control

ALS Environmental was the nominated primary laboratory to undertake laboratory analysis of validation samples, with Eurofins MGT adopted at the secondary analytical laboratory. Both ALS and Eurofins MGT are NATA accredited laboratories. The following data validation process will be used to determine the accuracy and precision of analytical results and to assess the reliability of the analytical data suite. **Table I5** outlines the analytical data validation criteria, qualifications to the data and the overall QA/QC procedures used for the laboratory testing program.

Table I5: Laboratory QA/QC

Protocol	Description
Holding Times	Holding times are the maximum permissible elapsed time in days from the collection of the sample to its extraction and/or analysis.
Reagent Blanks	The reagent blank sample is a laboratory prepared sample containing the reagents used to prepare the sample for final analysis. The purpose of this procedure is to identify contamination in the reagent materials and assess potential bias in the sample analysis due to contaminated reagents. The QC criteria are no detectable contamination in the reagents. Each analytical procedure will be subject to a reagent blank analysis.
Laboratory Duplicates	Laboratory duplicates are field samples that are split in the laboratory and subsequently analysed a number of times in the same batch. These sub- samples are selected by the laboratory to assess the accuracy and precision of the analytical method. ALS undertakes QA/QC procedures such as calibration standards, laboratory control samples, surrogates, reference materials, sample duplicates and matrix spikes. The adopted laboratory duplicate acceptance criterion is 50% RPD.
Matrix Spikes/ Matrix Spike Duplicates (MS/MSD)	MS/MSDs are field samples to which a predetermined stock solution of known concentrations has been added. The samples are then analysed for recovery of the known addition. Adopted acceptance criteria for MS are 70% - 130%, while laboratory MSD acceptance criterion is 50% RPD.
Blind Field Duplicates	Blind duplicates are split field samples which are both sent to the laboratory for individual analyses. The accepted RPD for non- volatiles is 30% and 50% for volatiles. These samples are analysed to assess the field methods.

The laboratory QA program indicates that the laboratory data was obtained under appropriate sample analysis QA/QC and that the Certificate of Analysis is reliable for the purposes of this assessment.

Completeness

The following information is required to check for completeness of data sets:

- Chain-of-custody forms (signed by the analytical laboratory)
- Sample receipt forms
- All sample results reported
- All blank data reported
- Al lab duplicates reported and relative percent differences (RPDs) calculated
- All surrogate spike data reported
- All matrix spike and matrix spike duplicate (MS/MSD) data reported and RPDs calculated
- NATA stamp on reports

The results of this check indicated that required documentation and data has been reported on NATA approved reports.

Accuracy

Accuracy is a measure of the agreement between an experimental determination and the true value of the parameter being measured. The determination of accuracy can be achieved through the analysis of know reference materials or assessed by the analysis of matrix spikes. Spiking of reference materials into an actual sample matrix is the preferred technique because it provides a measure of the matrix effects on the analytical accuracy. Accuracy is measured in terms of percentage recovery. Laboratory personnel calculate percentage recoveries of spiked compounds, which are evaluated against control or acceptance limits taken from the appropriate NATA approved method. If the spike recovery for a sample does not fall within the prescribed control limits, laboratory based corrective action is taken, although the sample is not necessarily re-analysed.

According to Schedule B(3) of NEPM 2013, sample results are qualified when a matrix spike recovery is below or above the QA acceptance criteria. Typically, results are qualified when percentage recovery is below QA acceptance criteria, indicating that sample results may be biased low. However, results are also qualified when percentage recovery is above QA acceptance criteria, indicating that sample results may be biased high.

Matrix spike recoveries were outside the acceptable criteria in the samples outlined below, however acceptable recoveries were generally obtained for laboratory control samples indicating sample matrix interference. On this basis, reported non-compliances are not considered to materially impact on reported laboratory data and results are considered suitable for interpretive use.

The majority of matrix spike non-compliances were reported to be associated with background levels greater than or equal to four times the spike level with the exception of the following samples:

- EB2314305-024 (anonymous) - Recovery of PFOS greater than the upper DQO
- EB2339711-002 (anonymous) - Recovery of PFHpS less than the lower DQOEB233711-002 (anonymous) - Recovery of 10:2 FTS greater than upper DQO

The majority of laboratory control spikes were reported within the acceptable criteria with the exception of the following:

- QC-4922993-002 – Recovery of MeFOSA, EtFOSA, MeFOSE and 4:2 FTS greater than the upper control limit
- QC-5504799-002 – Recovery of MeFOSA and EtFOSA greater than the upper control limit
- QC5513502-002 – Recovery of 4:2 FTS and 8:2 FTS greater than the upper control limit
- QC-5513290-002 – Recovery of MeFOSAA greater than the upper control limit
- QC-5123303-002 – Recovery of MeFOSA greater than the upper control limit
- QC-5123301-002 – Recovery of 10:2 FTS greater than the upper control limit
- QC-5123302-002 – Recovery of 10:2 FTS greater than the upper control limit
- QC-5123304-002 – Recovery of 10:2 FTS greater than the upper control limit
- QC-5104912-002 – Recovery of PFPeS and EtFOSAA greater than the upper control limit

Remaining matrix spike and laboratory control spike samples were reported within prescribed limits.

Precision

Precision is a measure of the ability to reproduce results, and is assessed on the basis of agreement between a set of replicate results obtained from duplicate analyses. The precision of a duplicate determination can be measured as RPD. Laboratory personnel calculate the RPDs of laboratory duplicates and MS/MSDs. Control or acceptance limits are taken from the appropriate method. If the RPD for a sample does not fall within the control limits, laboratory based corrective action is taken, however the sample is not necessarily re-analysed.

The following laboratory duplicate samples reported RPDs outside the acceptable limits:

- EB2306934-022 (MW79) –Sum of PFHxS and PFOS and Sum of PFAS (WA DER List)
- EB2339725-001 (EDC-SED-1) – Sulfate as SO4 2-, calcium and magnesium
- EB2314305-021 (anonymous) – PFHxS, PFOS and PFHxA
- EB2316811-028 (MW97-3.3) – iron

Remaining laboratory duplicates and MS/MSD RPDs were reported within prescribed limits. On this basis, reported non-compliances are not considered to materially impact on reported laboratory data and results are considered suitable for interpretive use.

Sensitivity

Sensitivity criteria are used to monitor achievement or quantification using method detection limits. Method detection limits depends on the method of analysis, the instrument's ability to measure analytes and the sample matrix; in particular, background interferences.

When interferences are present in the sample, a loss of sensitivity can occur resulting in an increase in the method detection limit. In some instances (e.g. where one or more compounds have particularly high concentrations) the sample must be diluted for analysis. This increases the method detection limit by the dilution factor.

Laboratory detection limits for PFAS in groundwater and surface water were raised above the 99% species protection limit in a number of samples collected across all monitoring events. Raised LORs were generally associated with the presence of suspended solids and/or TDS. It is noted that the majority of samples with raised LORs reported detections of PFAS compounds, and as such, results are generally considered suitable for interpretative use.

Laboratory Blanks

Laboratory blanks monitor externally introduced contaminants that potentially derive from glassware, cleaning reagents and digestion reagents during the analysis process. The blank consists of water and digestion reagents prepared in the laboratory. The laboratory blank is treated as a sample in the laboratory, going through the same sample preparation and analysis procedures as corresponding samples.

To meet the QC acceptance criteria the laboratory blanks should have no detectable concentrations of the target compounds. The laboratory blank results are presented in the laboratory analytical reports.

All laboratory blank results were reported within prescribed acceptance criteria.

Holding Times

Holding times from field sampling to laboratory analysis must be minimised to ensure the representativeness of the result obtained. Delays between sampling and analysis can lead to analytes changing due to processes such as volatilisation, mineralisations, and biological modification.

Where standard holding times are exceeded, professional judgement as to the integrity of the data will be required, taking into account such factors as field storage, laboratory storage and even sample bottle characteristics.

Holding times were reported to be exceeded in water for pH, TDS, TSS, alkalinity, cations and anions, nutrients and TOF in a number of work orders, with exceedances generally reported to be within two weeks. Holding

time exceedances in soil were reported for pH, conductivity, sulfur and TOF, with exceedances generally reported to be within 1 week.

All analytical results for the primary contaminant of concern (PFAS) were generally completed within prescribed holding times for the specific test.

Data Quality Objective Completion

The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical data can generally be relied upon for the purpose of this environmental investigation.

Based on the data collected, and an assessment of the QA/QC process and DQIs, Epic concludes that overall, the quality of the analytical data produced is reliable for the purpose of this investigation; a summary of objective completion can be found in **Table I6** below.

Table I6: Data Quality Indicators and Criteria

DQI	Evaluation Criteria	Status
Document Completeness	Completion of field calibration records, borehole reports, chain of custody documentation, laboratory test certificates from NATA certified laboratories	✓
Data Completeness	Sampling density comparison meets AS4482.1-2005 and NEMP sampling guidelines for potential contaminants of concern at all areas of greatest environmental concern.	✓
Data Comparability	Use of appropriate techniques for the sampling, storage and transportation of samples. Use of NATA certified laboratory using NEPM procedures. Comparison with previous site information.	✓
Data Representativeness	Good sampling coverage of all areas of environmental concern at the site, and selection of representative samples from each sampling location. Targeting area of concern for contaminants of concern.	✓
Precision and Accuracy for Sampling and Analysis	Use properly trained and qualified field personnel. Blind field duplicates to be collected at a minimum rate of 1 in 10 RPDs to be less than 30% for inorganic and 50% for organic analysis. Achieve laboratory QC criteria.	✓

APPENDIX G FIELD SHEETS

DAILY LOG

NOTES FOR THE DAY

- Start work at 7:30 . contacted Luke
- Sampled MW73, RN13030698, MW43, MW72, RN13030126
- purged ~~RN13030~~ dry RN13030697 due to slow recharge at 10:30 15:30
- Returned to RN13030697 at ~~17:00~~, not enough water column left to sample (very slow recharge)
- Finish work at 16:00 contacted Luke

Attempted to sample RN13030112, string tore around collar of hydrasleeve, could not recover hydrasleeve from bottom of well. String was likely cut by the kink in the bore

Daniel Popineau

Total Depth of Well (TD in m BTOC):		Depth (m BTOC):	22m
Height of Standing Water Column (TD-WL, in m):		Purged dry?	☑ No ☐ Yes, at _____ L

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

~~LOW FLOW~~ GROUNDWATER SAMPLING FIELD SHEET

Job Name:	CALIDE-QUARTERLY MONITORING	Well No:	MW78
Job No:	BC200153-03	Date:	03/11/2022
Recorded By:	EM/DP	Time:	
Weather:	SUNNY, WARM, 20°C		

CONSTRUCTION INFORMATION

Well Type:	☑ Monitor ☐ Extraction ☐ Other:	Well Stick Up (m): (above/below ground level)	
Well Material:	☑ PVC ☐ SS ☐ Other:	Screen Interval – Top (m BTOC)	
Well Head Condition:	GOOD.	Screen Interval – Bottom (m BTOC)	

WELL PURGING

PURGE VOLUME		PURGE METHOD	
LNAPL Level Depth (LL in m BTOC):		☐ Pump Type: ☐ Submersible ☐ Bladder ☐ Peristaltic ☐ Other	
Water Level Depth (WL in m BTOC):		Initial Pump Rate (L/min)	
DNAPL Level Depth (DL in m BTOC):	SEE SHEET 1	PUMP INTAKE SETTING	
Total Depth of Well (TD in m BTOC):		Depth (m BTOC): SEE SHEET 1	
Height of Standing Water Column (TD-WL, in m):		Purged dry? ☐ No ☐ Yes, at _____ L	

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

REGISTRATION NO OR ENGINE/FRAME NO:	802 EY9
ODOMETER READING:	243 7KM
OWNER:	AVIS (EPK ENVIRONMENTAL) TO BE PAID BY CS ENERGY
INSPECTED AT:	BILOELA WASHDOWN BAY
INSPECTION DATE:	27-10-22
AUTHORISED INSPECTION OFFICER:	IAN NEILL-BALLANTINE

Authorised Inspection Officer's Signature: I. Neill-Ballantine

COMPANY DETAILS

Washdown Inspection Fee $ _____ ☑ Short Notice Inspection Fee $_____ ☐

Invoice to be issued to

OWNER/COMPANY NAME:	Sally Bulten (CS Energy)		
PHONE:		**MOBILE:** 0447 241 695	
EMAIL ADDRESS:	Sbulten@csenergy.com.au		
POSTAL ADDRESS:	95 Biloela Callide Road		
TOWN/SUBURB:	Dumgree	**STATE:** QLD	**POSTCODE:** 4715
SPECIAL REQUIREMENTS FOR INVOICING: eg. Purchase Order, Project/Task No			
NAME OF DRIVER:	Michael Whitty		

I confirm that the Owner/Company listed above will be responsible for payment of Council's fees and charges.

Driver's Signature: _____

PRIVACY COLLECTION NOTICE: Banana Shire Council is collecting your personal information for the purpose of a vehicle/machinery inspection. The information will not be disclosed to any other person or agency external to Council without your consent, unless required by or authorised by law. Personal information will be handled in accordance with the *Information Privacy Act 2009*.

Whilst Banana Shire Council has taken all care in the inspection of the above vehicle/machinery, neither Banana Shire Council nor its Officers or Staff accept any responsibility for any weed contamination which may occur as a result of any inaccuracy or omission from this inspection. The ultimate responsibility to ensure the parcel of land is free of all weed contamination rests with the owner of the vehicle/machinery.

THIS INSPECTION IS VALID ONLY AT THE DATE OF INSPECTION.

DAILY LOG

DATE:	27/2/23
TIME START:	4:00
TIME END:	16:00

Project No: BC20153.03

Recorded By: DP

Project/Site: Callide Qtly

Other Field Staff: Dane Lawrence (CS Energy Staff)

Project Manager: MCK

Contractors:

PRE START

Planned tasks for the Day:

- Mobilise to site

Equipment in use:

- LV
- Pump
- IP
- YSI

NOTES FOR THE DAY

- Started at 7:00
- performed surface water sampling at:
  - SW20
  - SW36
  - SW12
  - SW2
  - DRD
  - PW1
  - SW43

other locations were dry / inaccessible, See surface water field sheets for info

- Finished on site at 16:00

David Papineau

Weed hygiene declaration

Part 1: Sale or supply of things

(Examples of 'things' include fodder, grain, seed, livestock, gravel, sand, soil, mulch, packing material, machinery, vehicles or water)

This declaration is valid for supplying the thing/things specified below from _____ to _____ (please provide dates)

1. Thing (please tick the relevant box and provide a brief description)

☐ Fodder ☐ Grain/seeds ☐ Sand/gravel ☐ Machinery ☐ Mulch ☐ Livestock ☐ Other

Amount _____ (e.g. weight, size of load, number of items)

Description _____ (e.g. cattle, hay, dozer)

2. Has the thing been moved through, stored in, come from, or used in a place infested with:

	Yes	No	Maybe
Parthenium			
Giant rat's tail grass, American rat's tail grass, giant Parramatta grass, Parramatta grass			
Prickly acacia			
Other (provide details)			

3. If you answered 'yes' or 'maybe' in question 2, then what actions have been taken to remove or ensure that there is no weed reproductive material*? (please tick the relevant boxes and specify steps taken)

*Please refer to the definition of 'weed reproductive material' in the explanatory notes.

☐ Nil ☐ Washing/cleaning ☐ Quarantine period ☐ Chemical treatment ☐ Certified clean _____ Other

Steps taken _____

4. To the best of my knowledge the thing described above still contains a weed listed in question 2 above.

Yes	No	Maybe

I, _____ of _____

town _____ state _____ telephone _____

declare that the information that I have provided in this declaration is true and correct and I have read the accompanying explanatory notes before completing this declaration.

Signature _____ Date _____

Part 2: Transport of contaminated things

('Vehicle' includes anything used for carrying any thing or any person by land, water or air, and includes equipment or machinery capable of moving on land)

This declaration is valid for transport and movement of vehicles and other things from CSE to BRANDT (please provide locations)

1. Movement of vehicles—The vehicle described as: make TOYOTA HILUX

registration no. or engine/frame no. 958 FN 7 was clean* prior to entry to MATT BRANDT PTY (destination)

*Please refer to the definition of 'clean' in the explanatory notes.

2. Transport of contaminated things—If you are transporting anything contaminated or possibly contaminated with any declared weed, what actions are being used to contain the weed reproductive material?

☒ Nil ☐ Covered with tarpaulin ☐ Enclosed within container ☐ Chemically treated _____ Other

Actions: N/A

I,* DARE LAWRENCE of 118 Jubilee Tce

town Borden state QLD telephone 0448070568.

*If same as Part 1 please write 'as above'

declare that the information that I have provided in this declaration is true and correct and I have read the accompanying explanatory notes before completing this declaration.

Signature _____ Date 08-03-23

Explanatory notes

This declaration was developed in response to landholders, rural industry, community and government desire to minimise the impact of weeds on their business and on the environment. It has been developed to assist in preventing the spread of weeds and other contaminants, and to meet the requirements of section 45 of the *Land Protection (Pest and Stock Route Management) Act 2002*. A completed declaration provides information on the status of a 'thing', whether it is contaminated or free of weedy material. 'Part 1: Sale or supply of things' of the declaration should be completed by the supplier then given to the receiver before they receive the thing. The receiver can then make an informed decision and take precautions to prevent new infestations. It can also provide written assurance that a vehicle is clean before entering a property.

Why use this declaration?
This declaration can provide:

- a supplier with a way of meeting the requirements of section 45 (2) of the Act, if they are supplying any thing that is or could be contaminated with the weeds listed below
- a person obtaining a thing with information on whether the thing is clean of weed reproductive material or has been infested
- assurance that a vehicle was clean* prior to entry onto a property
- assurance that any contaminated or potentially contaminated thing is being moved so as not to spread the contaminant
- assurance that a product is free of other weedy reproductive material.

Section 45 of the Act makes it an offence to supply a thing that is contaminated with a Class 1 weed or any of the Class 2 weeds listed below. However, for the Class 2 weeds, a person does not breach section 45 if they provide a written notice (Part 1 of this declaration) that states that the thing is or may be contaminated. The written notice must be filled and given to the receiver before the thing is supplied.

List of Class 2 species
The following Class 2 pests are prescribed in section 45(1)(b) of the Act. These weeds are readily able to infest a wide range of products, from livestock to grain and vehicles. These weeds have a major effect on pasture production and have the capacity to invade large areas of Queensland.

Common name	Species
American rat's tail grass	*Sporobolus jacquemontii*
Giant Parramatta grass	*Sporobolus fertilis*
Giant rat's tail grass	*Sporobolus pyramidalis* and *S. natalensis*
Parramatta grass	*Sporobolus africanus*
Parthenium	*Parthenium hysterophorus*
Prickly acacia	*Acacia nilotica*

Across Queensland, isolated outbreaks of declared plants such as those listed above are found on properties and roadsides each year. Outbreaks of these declared plants are often located hundreds of kilometres from core infestations. These outbreaks occur as a result of machinery, livestock, vehicles, fodder, grain, material and equipment contaminated with weed seeds being transported across the state. A high percentage of seed from prickly acacia and giant rats tail grass remains viable after being eaten and excreted by cattle.

***Definitions**
Clean:

- For vehicles, machinery and equipment, clean means that no soil and/or organic matter that may contain weed reproductive material is on or in areas that are accessible during cleaning and maintenance work. A checklist and guidelines that show areas that are required to be clean are available at www.biosecurity.qld.gov.au
- A vehicle is considered to remain clean if it leaves its point of origin clean and only travels on sealed roads or well-maintained unsealed roads.
- For livestock, clean means that animals are internally and externally free of the reproductive material of any declared plant listed in the Land Protection (Pest and Stock Route Management) Regulation 2003. If livestock are suspected to be infested with a declared weed, then they should be quarantined within a weed-free paddock or pen for a 14-day period.

Weed reproductive material means any part of the plant that is capable of producing another plant by sexual or asexual reproduction. Examples include seeds, bulbs, rhizomes, tuber, stem or leaf cutting and the whole plant.

Well-maintained unsealed road means roads that do not have vegetation growing on or encroaching onto the area occupied by traffic.

For further information, please contact Biosecurity Queensland on 13 25 23.

DATE:	**12/6/23**
TIME START:	**7:00**
TIME END:	**16:30**

NAME	COMPANY	SIGNATURE	NAME	COMPANY	SIGNATURE

NOTES FOR THE DAY

Arrived on site at 7:30
Performed groundwater sampling between 7:30 and 14:30
Cleaned off car for weed and seed checkoff at 15:00
Left site at 16:30

DAILY LOG

DATE:	**13/6/23**
TIME START:	**7:00**
TIME END:	**16:30**

Project No: BC200153.03

Project Manager: Luke Amies

Site: Callide Power Station

Recorded by: DP

Other field Staff: Dare Lawrence, Sharon Geall

Contractors

PRE START

Planned tasks for the Day:

Perform groundwater sampling on wells using the monsoon pump

Drop hydrasleeves into additional sampling locations.

Sample MW97

Equipment in use:

LV

IP

YSI

Monsoon Pump

TIME START:	**7:00**
TIME END:	**16:30**

NAME	COMPANY	SIGNATURE	NAME	COMPANY	SIGNATURE

NOTES FOR THE DAY

Arrived on site at 7:30
Car checked off for Weed and Seed by Dare Lawrence, subsequently samples wells at Matt Brandt's property
Performed surface water and groundwater sampling between 8:00 and 16:00
Hydrasleeves dropped into additional wells (MW06, MW26, MW27, MW59, MW60, Bore X)
Purged MW97 dry to sample tomorrow, couldn't get water level to stabilise on low flow pumping
Left site at 16:30

DAILY LOG

DATE:	**14/6/23**
TIME START:	**7:30**
TIME END:	**13:30**

Project No: BC200153.03

Project Manager: Luke Amies

Site: Callide Power Station

Recorded by: DP

Other field Staff: Dare Lawrence, Sharon Geall

Contractors

PRE START

Planned tasks for the Day:

Collect hydrasleeves from additional sampling locations

Sample MW97 following purging

Check ESC5 and ESC6 with borehole camera

Equipment in use:

LV

IP

YSI

Borehole Camera

NAME	COMPANY	SIGNATURE	NAME	COMPANY	SIGNATURE

DATE:	14/6/23
TIME START:	7:30
TIME END:	13:30

NOTES FOR THE DAY

Arrived on site at 7:30
Collected hydrasleeves from additional well locations
Sampled MW97
Checked ESC5 and ESC6 with the borehole camera, MW61 could not be accessed-couldn't fit camera inside bore without removing the pump (would require a forklift). No evidence of damage to the casing was observed inside the bores
Left site at 13:30

DAILY LOG

DATE:	**15/6/23**

CONSTRUCTION INFORMATION

Well Type:	☐ Monitor ☐ Extraction ☐ Other:	Well Stick Up (m): (above/below ground level)	
Well Material:	☐ PVC ☐ SS ☐ Other:	Screen Interval – Top (m BTOC)	7.0
Well Head Condition:		Screen Interval – Bottom (m BTOC)	10.0

WELL PURGING

PURGE VOLUME		PURGE METHOD	
LNAPL Level Depth (LL in m BTOC):		☐ Pump Type: ☐ Submersible ☐ Bladder ☐ Peristaltic ☐ Other	
Water Level Depth (WL in m BTOC):	7.07	Initial Pump Rate (L/min)	
DNAPL Level Depth (DL in m BTOC):		**PUMP INTAKE SETTING**	
Total Depth of Well (TD in m BTOC):	10.28	Depth (m BTOC): 9.5	
Height of Standing Water Column (TD-WL, in m):		Purged dry? ☐ No ☐ Yes, at _____ L	

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

Height of Standing Water Column (TD-WL, in m):		Purged dry?	☐ No ☐ Yes, at _____ L

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

FIELD PARAMETER MEASUREMENTS

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

DNAPL Level Depth (DL in m BTOC):		**PUMP INTAKE SETTING**	
Total Depth of Well (TD in m BTOC):		Depth (m BTOC):	
Height of Standing Water Column (TD-WL, in m):		Purged dry?	☐ No ☐ Yes, at _____ L

In accordance with USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504), draw down to be limited to <0.1m during sampling. Typically, flow rates on the order of 0.1 - 0.5 L/min are used, however this is dependent on site-specific hydrogeology and flow rates up to 1 L/min may be acceptable where draw down is able to be maintained at <0.1m.

FIELD PARAMETER MEASUREMENTS

Time	Volume Purged	Pump Rate	SWL	pH	Electrical Conductivity	ORP or RedOx	DO	DO	Turbidity	Salinity colour	TDS odour	Temp.
HH:MM	L	L/min	m BTOC	-	µS/cm	mV	ppm	% Sat	NTU			°C
				6.97	8731	53.4	0.93	@ 11.4		clear	none	24.5
Acceptable Variation			<0.1m	± 0.1	± 3%	± 10 mv	± 10%	± 10%	± 10%	-	-	-
Results Acceptable? Y/N												

Note: Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504).

Observations during purging (well condition, turbidity, colour, odour):

Hydrasleeve dropped 5/9/23, collected 6/9/23

Discharge water disposal: ☐ Drums Other

WELL SAMPLING

SAMPLING METHOD

☐ Bailer – Type: ☐ PVC ☐ SS ☐ Teflon ☐ Other

☐ Same as purge method

☐ Pump – Type: ☐ Submersible ☐ Bladder ☐ Other

1.At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

2.Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Note:

1.At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

2.Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Note:

1.At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

2.Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Other photos:

Note:

1.At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

2.Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Note:

1.At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

2.Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

NOTES FOR THE DAY

- **Arrived on Site at 7:00**
- **Attempted to drill MW95,constantly hit refusal in multiple boreholes (MW95, MW95#2), one borehole reached ~5m before refusal, but the conditions in the bore made well installation too difficult (very ashy and gravelly)**
- **Drilled MW97, reached 0.5m into saturated zone (3.3 mbgl total depth) before refusal, attempted to drill second borehole (MW96#2) to try to reach 6m and only got to ~1.5m before refusal. Installed well in the 3.3m deep borehole**
- **Drilled multiple boreholes for MW96 (MW96, MW96#2, and MW96#3), was hitting refusal at or before 3 mbgl. One borehole reached 6 mbgl before refusal, but no water was present. A dry well was installed at this location (MW96#3). The well was installed at the side of the access road, could not be drilled into Ash Dam 2 as this area was not service located.**
- **Left site at 17:00**

Email: dpapinczak@epicenvironmental.com.au **Phone:** +61439115598

Sequence No 224998129
Enquiry Location: 1092 Biloela Callide Road Mount Murchison
Enquiry Date: 24/05/2023 10:47

Dear Daniel Papinczak

Thank you for your enquiry in relation to the Enquiry Location. Queensland Electricity Transmission Corporation Limited ACN 078 849 233 trading as Powerlink Queensland ("Powerlink") respond as follows:

Powerlink's records show that there **ARE** underground cables in the Enquiry Location.

A plan is attached showing the approximate location of Powerlink's assets in the vicinity of the Enquiry Location.

Should our response identify the presence of decommissioned Powerlink assets it should be noted that damage to these assets may result in an environmental hazard . As a precaution, all underground assets should be treated as live, and all necessary precautions should be taken to ensure that the cables are not damaged. Should damage occur, all work in the area surrounding the cables must be ceased immediately and Powerlink called on 07 3266 9410 to report the damage and get further advice.

Proposed works in close proximity to Powerlink's plant must undergo a detailed assessment by Powerlink. Please allow at least four to six weeks (more in complex situations) for Powerlink to process your application.

All work in close proximity to Powerlink's cables must be supervised by a Powerlink-appointed person and can be arranged by contacting Powerlink on (07) 3866 1313 at least seven days in advance.

The attached duty of care guidelines below must be observed at all times

Yours faithfully

Narelle Titman
Manager Property
Powerlink Queensland

Powered by: dbydsuite

Before You Dig Terms and Conditions

"Duty of Care" for Everyone

Responsibilities When Working in the Vicinity of POWERLINK'S Plant

Everyone has a legal duty of care that must be observed, particularly when working in the vicinity of electrical plant. "Electrical plant" includes underground cables, conduits and other associated underground equipment. It should be noted that the placing or removal of soil by excavation, digging or by any other means is not allowed in a Powerlink-easement without prior written consent from Powerlink. In most cases it is unlikely that consent will be granted.

When discharging this duty of care in relation to Powerlink's plant, the following points must be considered:

1. It is the responsibility of the architect, consulting engineer, developer and head contractor in the project planning stages to design for minimal impact and adequate protection of Powerlink's plant. Powerlink will provide free plans showing the presence of its underground plant to assist.
2. It is the developer or constructor's responsibility to:
    - investigate whether Powerlink's plant is present in a particular location and obtain the most up to date plans available from Powerlink before commencing construction.
    - visually locate Powerlink's plant by hand digging where construction activities may be in close proximity to or interfere with Powerlink's plant.
    - contact Powerlink's Property Services & Management Team on (07) 3866 1313 if Powerlink's plant is wholly or partly affected by planned development and construction activities.
3. As the alignment and boundaries of road ways with other properties (and roads within road ways) frequently change, the alignments and boundaries contained within Powerlink's plans and maps will frequently differ from present alignments and boundaries "on the ground". Accordingly, in every case where it appears that alignments and boundaries have shifted, or new road ways have been added, the constructor should obtain confirmation of the actual position of Powerlink's plant under or along the road ways. The constructor must never rely on statements made by third parties in relation to the position of Powerlink's plant.

Important Points to Note – Please Read

• Plans and details provided by Powerlink are current for one month from the Response Date and should be disposed of by shredding or any other secure disposal method after use.

• Powerlink's plans are diagrams only. They indicate the presence of underground plant in the general vicinity of the Enquiry Location. Exact ground cover and alignments cannot be given with any certainty, as such levels can change over time.

• To avoid damage or injury, Powerlink's plant must be carefully located under the supervision of a Powerlink-appointed person before excavation work or similar activities are undertaken near Powerlink's plant.

• Powerlink, its servants and agents will not be liable for any loss or damage caused or occasioned by the use of plans and or details so supplied to the applicant, its servants and agents, and the applicant agrees to indemnify Powerlink against any claim or demand for any such loss or damage.

• Where work commences prior to obtaining Powerlink's plans, or Powerlink's instructions are not followed, the developer/constructor is responsible for all damages sustained to Powerlink's plant.

• Powerlink reserves all rights to recover compensation for loss or damage caused by interference or dam age, including consequential loss and damages to its cable network, or other property.

• All underground conduits and cover slabs must be presumed to contain asbestos. Refer to "Code of Practice for the Management and Control of Asbestos in Workplaces [NOHSC: 2018 (2005).]

• PCB (polychlorinated biphenyl) contamination may exist in some cables.

Remote or On-Site Location Assistance

If requested, Powerlink may provide either remote over –the-phone or on-site location assistance with locating Powerlink's plant. This assistance may include guidance on visually locating and protecting Powerlink plant when excavating. Please note that any markings or pegs placed on the site by Powerlink during any such visit are indications of approximate cable locations only. The constructor is responsible for all hand digging (potholing) to visually locate and expose POWERLINK'S plant.

If the constructor is unable to locate Powerlink's plant within five metres of indicative plan locations, they must contact Powerlink's Regional Officer for Local Security for further advice. Contact details are as follows;

Officers for Local Security:

Region name	Contact's name	Telephone number	Mobile number
Southern	Bruce Muhling	(07) 3860 2305	0417 294 210
Central	Jeff Anstey	(07) 4931 2718	0418 785 743
Northern	Steve Cazzulino	(07) 4789 5561	0418 875 137

When working in the vicinity of Powerlink's plant, please observe the following conditions:

Records

The first step before any excavation commences is to obtain records of Powerlink's plant in the vicinity of the work. For new work, records should be obtained during the initial planning and design stage. The records provided by Powerlink must also be made available to all construction groups on site. Where plant information is transferred to plans for the proposed work, care must be exercised to ensure that important detail is not lost in the process.

Location of Cables

Examining the records is not sufficient, as reference points may change from the time of installation. Records must also be validated when working in close proximity to underground plant. The exact location of plant that maybe affected must be confirmed by use of an electronic cable locater followed by careful hand excavation to the level of cover slabs or conduits. Hand excavation must be used in advance of excavators. If doubt exists with respect to interpretation of cable records, Powerlink's Regional Officer for Local Security must be contacted. Refer to the contact details above.

Electrical Cable Covers

Powerlink's cables have underground cable warning tapes installed above the cables with the wording 'high voltage cable' and some may also have additional mechanical protection. Please note that some cables are known to be buried without covers.

Supervision

Any work in close proximity (within cable easement or five metres from the cable) to Powerlink's cables will always require on site supervision arranged by Powerlink.

Proposed works

No placing or removal of soil by excavation, digging or by any other means is allowed in Powerlink's easement without prior specific written consent from Powerlink.

Excavating Near Cables

For all work within five metres of where the plant is shown on Powerlink's plans, the constructor is required to hand dig (pothole) and expose the plant to confirm its exact location before work can commence.

Excavating Parallel to Cables

If construction work is parallel to Powerlink's cables, then hand digging (potholing) at least every four metres is required to establish the location of all cables to confirm the exact location of Powerlink's plant before workcan commence. Generally, no restrictions are placed on excavations parallel to Powerlink's cables to a depthnot exceeding that of the cable and the entire excavation is located outside Powerlink's easement. If an excavation exceeds the depth of the cables and is within five metres of the edge of the easement (or within ten metres of the cable) it is likely that the covers or bedding material around the cables or conduits will move, and Powerlink must be contacted. Design for the installation of parallel infrastructure will need to take into account electrical issues, including induction and transferred potential. Please note that cable depths may change suddenly.

Excavating Across Cables

A minimum clearance of 150 mm above, below, and to the sides of cables must be maintained. A standard clearance between services must be maintained as set down by the individual authorities. If the width or depth of the excavation is such that the cable warning tapes are exposed or the cables being unsupported, then Powerlink must be contacted to determine whether the cables should be taken out of service, or whetherthey need to be protected or supported. In the case of high voltage cables, it is unlikely that Powerlink will be able to take the cables out of service, and is definitely not an option without a lead time of at least 12 months.A cable cover must never be removed without prior specific written approval. A cable cover and the warning tapes may only be replaced under the supervision of a Powerlink officer. Protective cover strips must never be omitted to allow separation between Powerlink's cables and other services.

Directional Boring Near Cables

When boring parallel to cables, it is essential that trial holes are carefully hand dug at regular intervals to validate the actual location of the Powerlink's conduits or cables before using boring machinery. Where it is required to bore across the line of cables, the actual location of the cables must first be proven by hand digging.A trench must be excavated one metre from the side of the cables where the auger will approach to ensure a minimum clearance of 150 mm from cables can be maintained.

Heavy Machinery Operation over Cables

If a heavy "crawler" or "vibration" type machinery is proposed to be operated over the top of cables, detailed engineering plans and supporting information must be submitted to Powerlink for its approval, or otherwise (in writing) prior to any on site work commencing.

Hot Work in Proximity to Exposed POWERLINK'S Plant and Underground Cables

Exposed underground electrical cables must be protected against the effects of heat by shielding or covering cables with a suitable material. Heating of exposed insulation is dangerous and must be avoided at all costs.

Explosives

Before using explosives in the vicinity of POWERLINK'S cables, clearances should be obtained from Powerlink's Design Engineer. If explosives are proposed to be used within 100 metres of cables, an engineering report demonstrating that no damage will be sustained to Powerlink's plant must be provided to Powerlink prior to using such explosives.

Damage Reporting

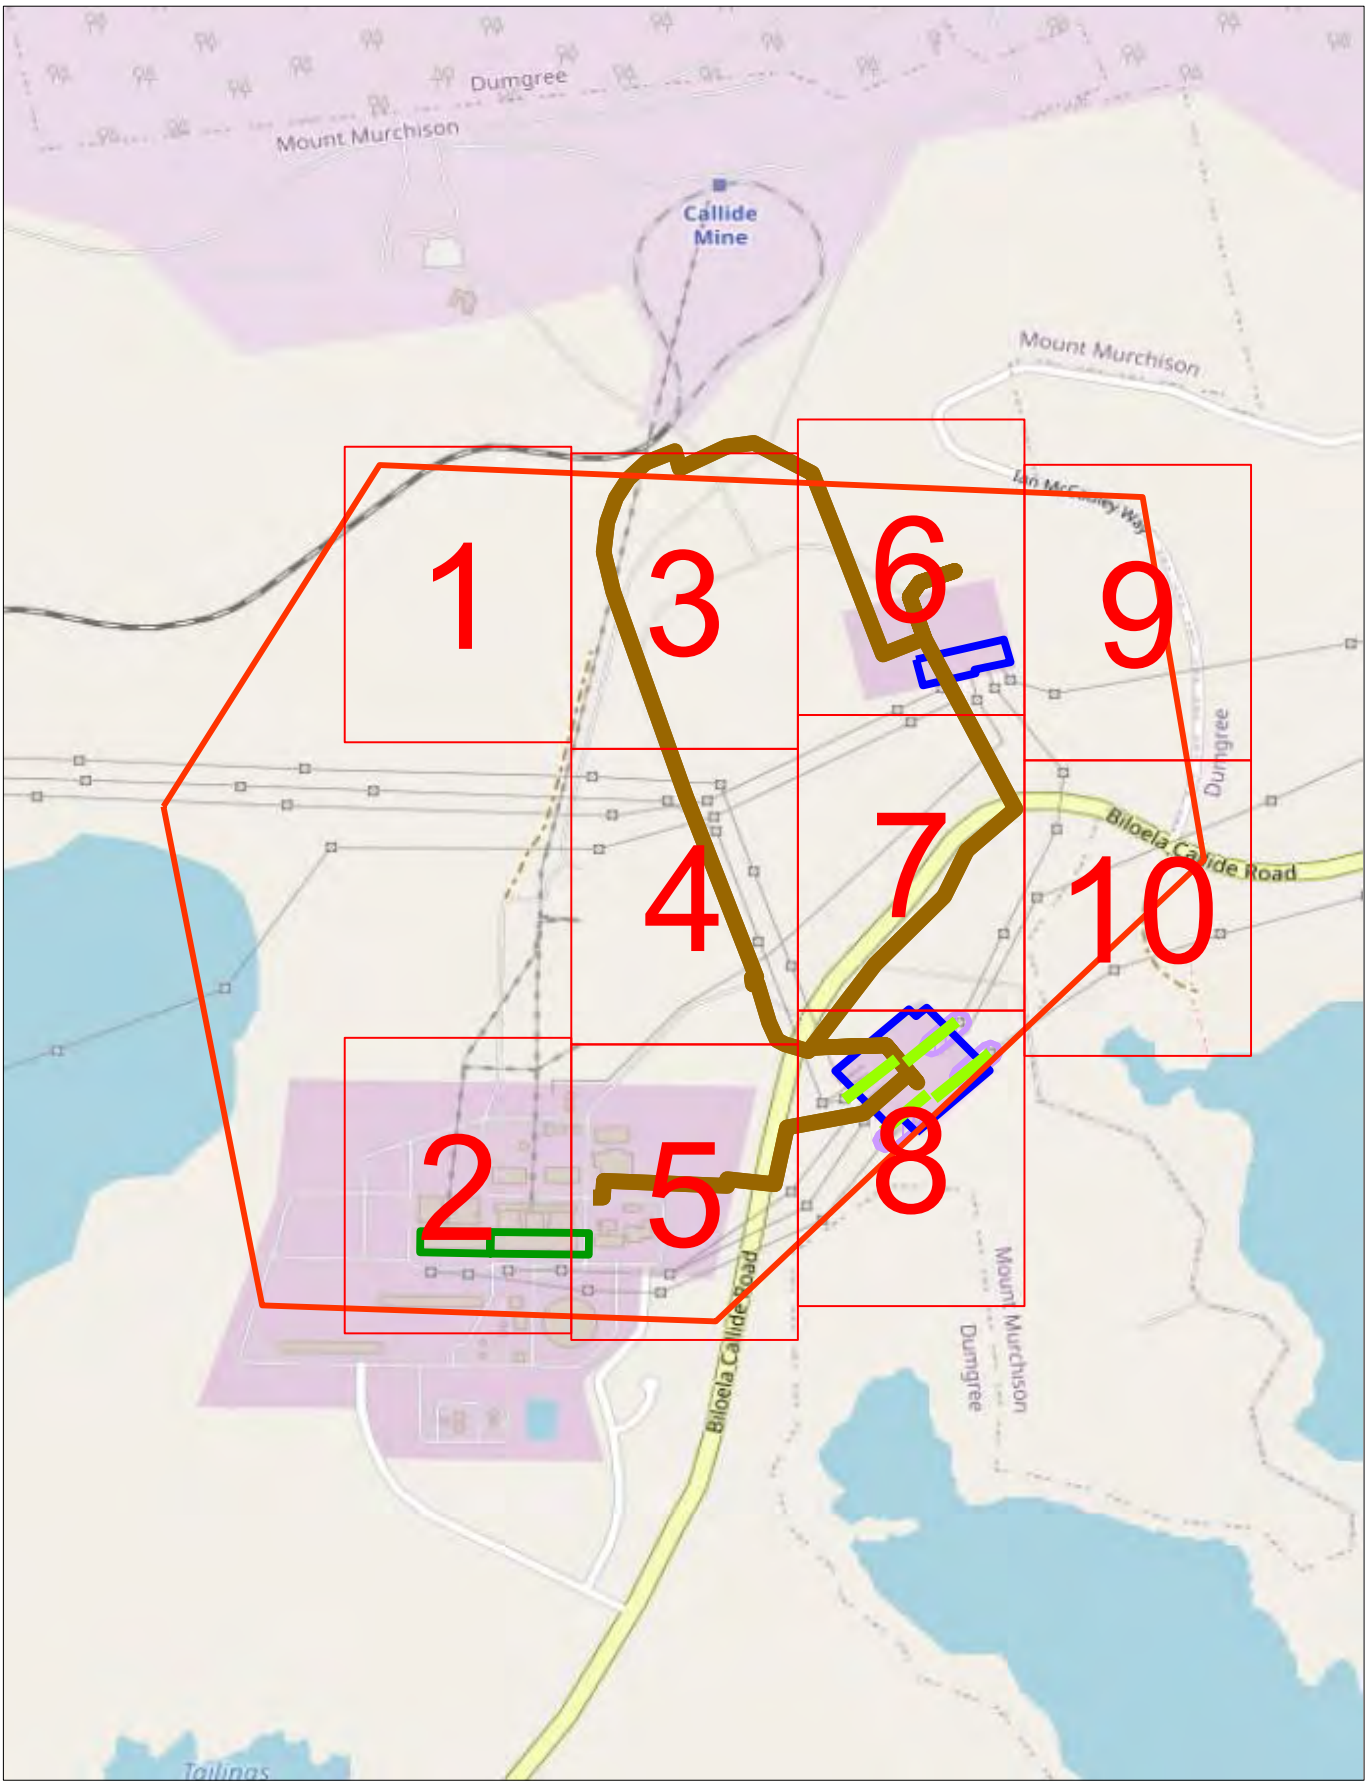
All damage to Powerlink's cables, conduits and pipes must be reported to Powerlink no matter how insignificant the damage appears to be. Even very minor damage to cable protective coverings can lead to eventual failure of cables through corrosion of metal sheaths and moisture ingress. Some cables contain oil, and dam-age may result in an oil leak which will seriously impact the performance of the cable and will be treated as an environmental incident. All work in the vicinity of any of Powerlink's plant that has been damaged should cease and the area should be vacated until a clearance to continue work has been obtained from an authorised Powerlink officer.

Please note that high voltage electrical cables, if damaged, can cause serious injury, or fatality. Extreme caution needs to be exercised at all times when working in close proximity to these cables.

Electricity emergencies all areas or after hours enquiries
24 Hours **1800 353 031**

Plant Solutions and Assistance

If Powerlink's plant location plans or visual location of Powerlink's plant by hand digging reveals that the location of this plant is situated wholly or partly where the developer or constructor plans to work, then Powerlink's Property Services & Management Team must be contacted on (07) 3866 1313 to discuss possible engineering solutions.



If detailed engineering assessment work, plant relocation, or protection works are part of the solution offered by Powerlink, then the cost of this work (the technical assessment and design, as well as the solution implementation cost) is recoverable by Powerlink from the principal developer or constructor. Powerlink will not commence work on the assessment and design until the developer or constructor provide a purchase order for these works. Powerlink will then provide a cost estimate for any proposed solution, and will not commence work on the solution until the developer or constructor provide a purchase order for the cost estimate.

NOTES FOR THE DAY

- **Arrived on Site at 7:00**
- **Attempted to drill MW95,constantly hit refusal in multiple boreholes (MW95, MW95#2), one borehole reached ~5m before refusal, but the conditions in the bore made well installation too difficult (very ashy and gravelly)**
- **Drilled MW97, reached 0.5m into saturated zone (3.3 mbgl total depth) before refusal, attempted to drill second borehole (MW96#2) to try to reach 6m and only got to ~1.5m before refusal. Installed well in the 3.3m deep borehole**
- **Drilled multiple boreholes for MW96 (MW96, MW96#2, and MW96#3), was hitting refusal at or before 3 mbgl. One borehole reached 6 mbgl before refusal, but no water was present. A dry well was installed at this location (MW96#3). The well was installed at the side of the access road, could not be drilled into Ash Dam 2 as this area was not service located.**
- **Left site at 17:00**

NOTES FOR THE DAY

- **Arrived on site at 7:00**
- **Collected surface soil samples from drainage line**
- **Water sample collected from access staircase between coal hoppers, as there was insufficient water volume in the coal hoppers. There is connectivity between the coal hoppers and access staircase.**
- **Purged MW97 dry**
- **Finished COC and began demob**
- **Delivered samples to ALS at 16:00**
- **Arrived in Brisbane at 8:00pm**

Well Development

STANDARD GROUNDWATER SAMPLING FIELD SHEET

Job Name:		Well No:	MW97
Job No:	BC200153.03	Date:	2/6/23
Recorded By:	DP	Time:	
Weather:			

CONSTRUCTION INFORMATION

Well Type:	Monitor ☒ Extraction ☐ Other:	Well Stick Up (m): (above/below ground level)	0.68 m
Well Material:	☐ PVC ☒ SS ☐ Other:	Screen Interval – Top (m BTOC)	~~2.5~~ 2.5
Well Head Condition:		Screen Interval – Bottom (m BTOC)	~~4.0~~ ~~4.0~~ 4.0

WELL PURGING

PURGE VOLUME		PURGE METHOD	
LNAPL Level Depth (LL in m BTOC):		☐ Bailer Type: ☐ PVC ☐ SS ☐ Teflon ☐ Other	
Water Level Depth (WL in m BTOC):	2.58	☐ Pump Type: ☐ Submersible ☐ Bladder ☐ Peristaltic ☐ Other	
DNAPL Level Depth (DL in m BTOC):		PUMP INTAKE SETTING	
Total Depth of Well (TD in m BTOC):	~~3.50~~ ~~3.75~~ 4.0	Depth (m BTOC):	
Height of Standing Water Column (TD-WL, in m):		Purged dry?	☐ No ☐ Yes, at _____ L

Minimum Purge Volume Required	Well Diameter (mm)	Well Annulus (mm)	Height Standing Water Column/ Length (m)	Multiply Length by (L/m)[1]	= Total Volume (L)	Multiply Total Volume by 3[2]
	50	100		3.5		
	50	150		6.5		

[1] Volume per 1m: casing volume + filter pack volume (effective porosity assumed at 0.3) - [πr(casing)² + 0.3 x (πr(annulus)² - πr(casing)²)
[2] At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge
Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

FIELD PARAMETER MEASUREMENTS

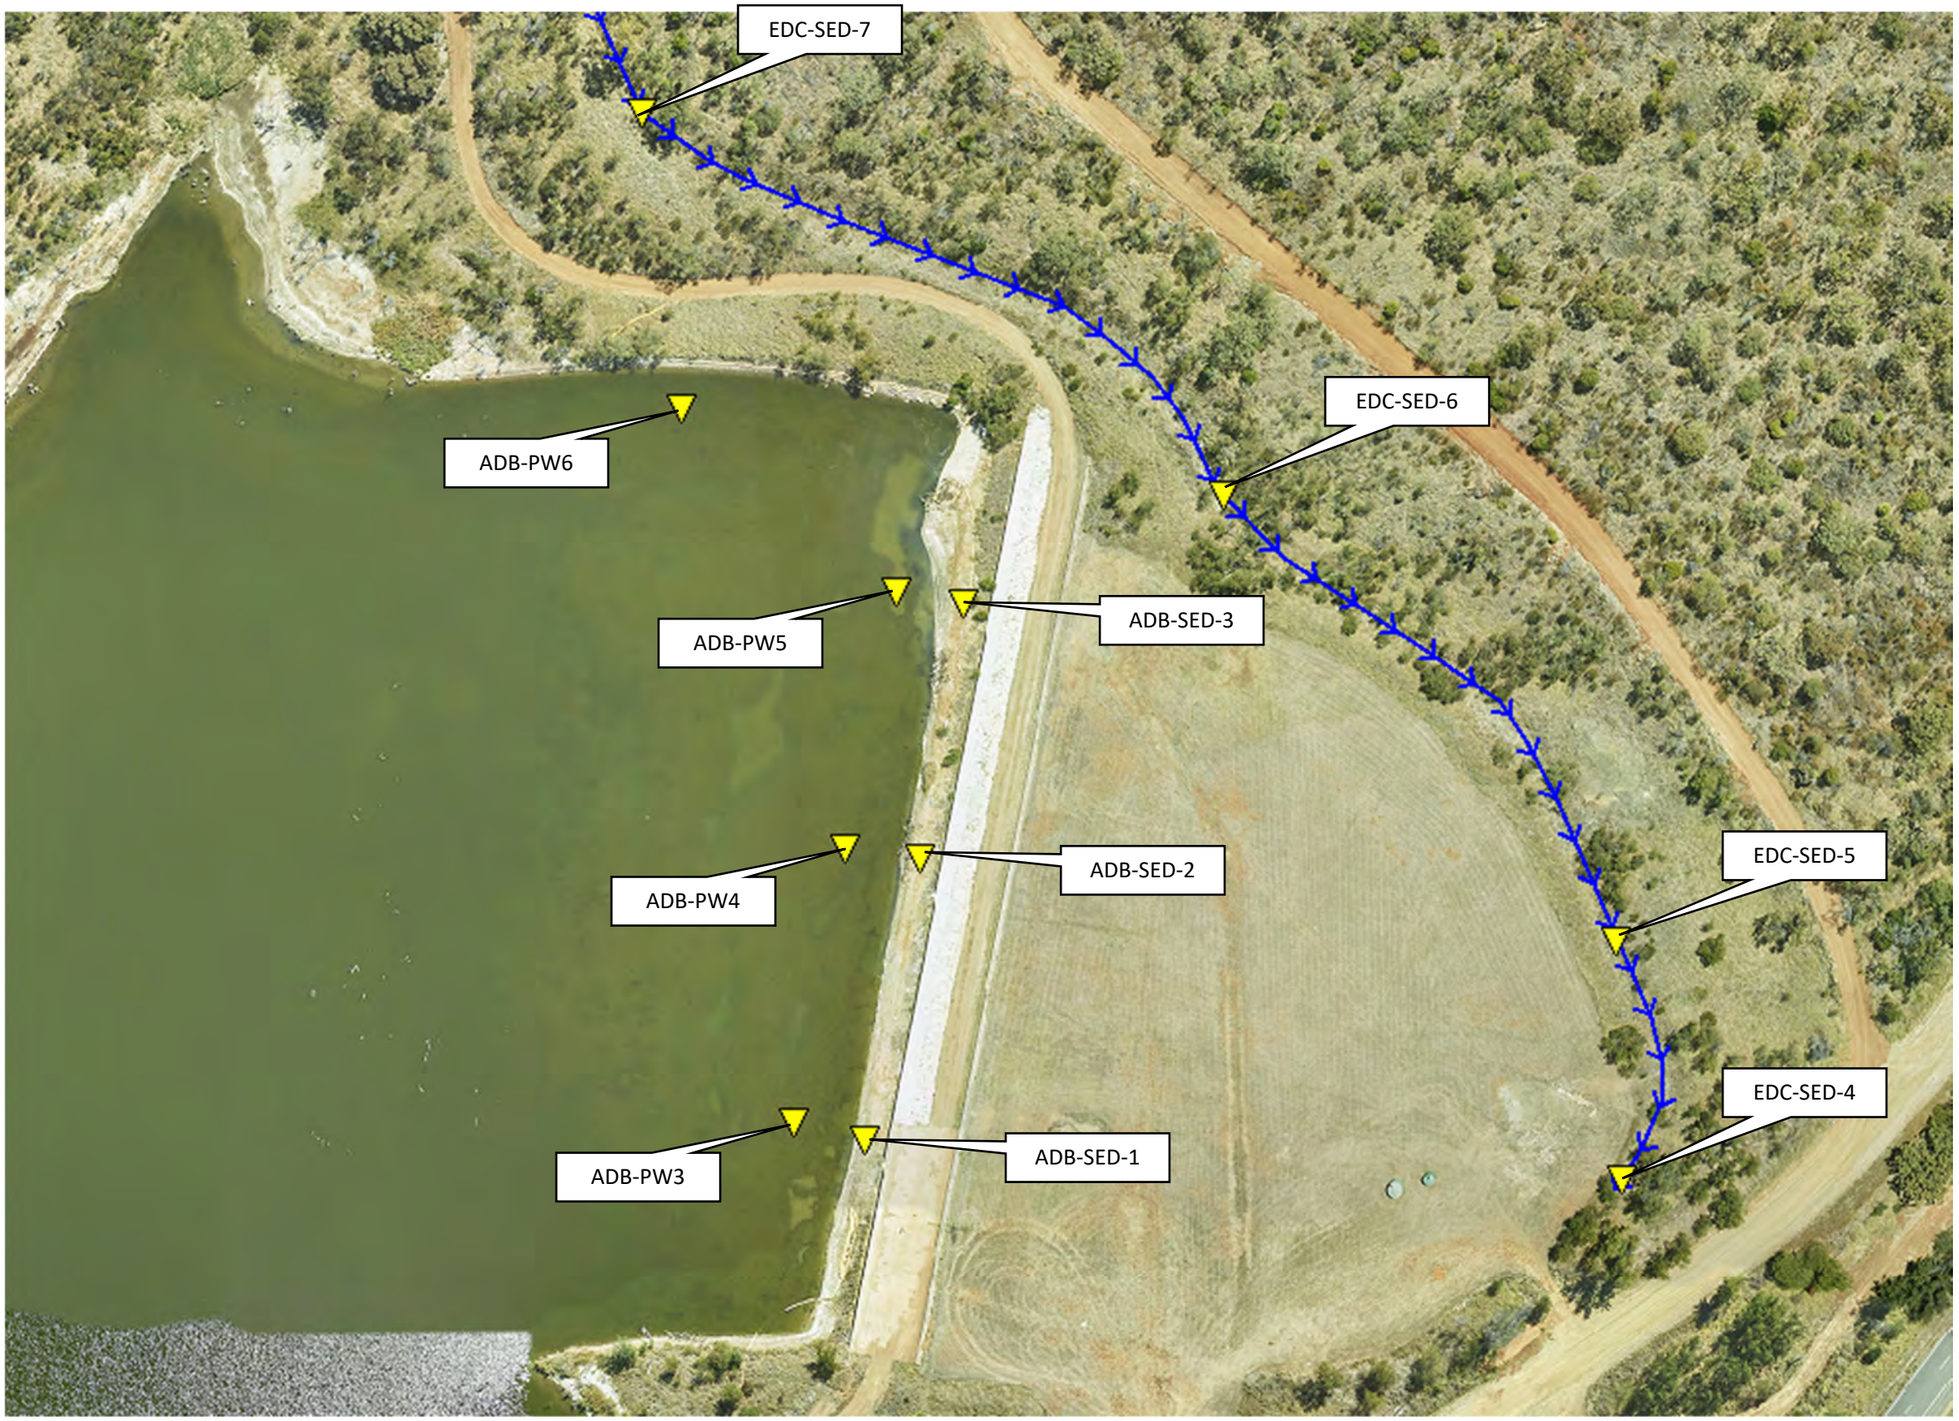
Time	Volume Purged	pH	Electrical Conductivity	ORP or RedOx	DO	DO	Turbidity	Salinity Colour	TDS	Temp.
HH:MM	L	-	µS/cm	mV	ppm	% Sat	NTU			°C
2/6/23	~~~~ ~4L	7.64	663	28.3	3.72	43.5		brown		23.3
3/6/23	~4L	7.72	642	23.6	2.33	27.0		grey-brown		22.5
1/6/23	~4L	7.71	663	15.5	3.26	37.1		grey-brown		21.6
~~3/6/23~~										
Acceptable Variation		± 0.1	± 3%	± 10 mv	± 10%	± 10%	± 10%	-	-	-
Results Acceptable? Y/N										

Note: Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Observations during purging (well condition, turbidity, colour, odour):

Discharge water disposal: ☐ Drums ☐ Other: Purged dry 3 times

WELL SAMPLING



SAMPLING METHOD
☐ Bailer – Type: ☐ PVC ☒ SS ☐ Teflon ☐ Other
☐ Same as purge method
☐ Pump – Type: ☐ Submersible ☐ Bladder ☐ Other

Eastern Drainage Channel Sediment Sampling Notes – 11 Dec 2023

- Sampling completed by Dan Papinczak, with Sharon Geall (CS Energy) as secondary person for safety purposes regarding surface water sampling
- QC01/QC02 collected from EDC-SED-6
- ADB-PW3 to ADB-PW6 samples collected from Ash Dam B
- Borelogs not written up for surface soil samples, but have provided soil characteristics below:
- EDC-SED-1 to EDC-SED-3 were taken from the sediment along the shoreline of Ash Dam B, adjacent to the surface water sampling locations ADB PW3 to ADB PW5.
    - Sediment consisted of a moist/wet, grey, gravelly sandy clay, containing organic material (twigs, leaves) and small gravels
- EDC-SED-4 to EDC-SED-7 were taken along the eastern drainage channel.
    - EDC-SED-4 and EDC-SED-5 consisted of dry brown gravelly sand, with small to medium gravels
    - EDC-SED-6 consisted of a moist/wet, soft brown gravelly sandy clay with medium plasticity
    - EDC-SED-7 consisted of a dry, brown, medium dense sand with minor small gravels

PGN9003842-9003846 - INTERFACE METER

Plant Number: 235280

Probe Length: 60MT

ITEM	TEST	PASS	COMMENTS
Battery	Compartment / Capacity	☑	9v
Probe	Clean / Operation	☑	
Earth Lead	Check if equipped	☑	
Tape Check	Cleaned / Checked for cuts	☑	
Function test	At surface level	☑	

Note: Calibration traceability information is available upon request.

Please clean/decontaminate instrument and accessories before returning. A minimum 'Cleaning Fee' $55.00 (Inc GST) may apply if instrument is returned contaminated.

Checked By: Joshua Roy Date: 14/08/23 Signed: _____

Accessories List:

Interface Meter	Tape Guide	Decon 90 Solution
Brush	Spare 9v Battery	Instruction Manual
Transport Box

Figure D.1 Bore MW81 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW81
Easting / Northing	
Start date	12-7-23
Finish date	20-7-23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA
	Install casing and the ~~attached~~ tremie line		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Acknowledgement of successful bore installation

Figure D.3 Bore MW83 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW83
Easting / Northing	
Start date	14.7.23
Finish date	20.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		
	Install casing and the ~~attached tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Figure D.5 Bore MW85 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW85
Easting / Northing	
Start date	19.7.23
Finish date	20.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA Lowered
	Install casing and the ~~attached~~ tremie line		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL.
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL.
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL.
	Install head works		
	Head works observed to be installed		BL.
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL.
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		Minimal flow Not Tested.
Completion	Bore successfully completed. Suitable for intended purpose		BL

Acknowledgement of successful bore installation

	Organisation	Person	Role	Acknowledgement - signature
Client Representative				
Supervising Hydrogeologist	GHD	B. Llewellyn		
Drilling Subcontractor	JAB	Tony W	Licenced Water Bore Driller	

Construction notes Bore constructed as asked

Notes
On completion of drilling to 40m it was noticed that water was flowing into the bore. JAB (Tony) used portable bore camera to locate water entering the bore at 10m depth.
Decided to cover this depth with screen of 9.5m to 15.5m
Development problems due to air pushing the low flow back into formation with minimal to no flow at collar.
Suggest develop with small pump

Figure D.8 Bore MW90 chip samples

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW90
Easting / Northing	
Start date	28.7.23
Finish date	28.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		GL.
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		GL.
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		GL.
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		GL.
	Field test for hydration of bentonite pellets		GL.
	Measure and record the casing lengths		GL.
	Mark the casing length for the location of the tremie pipe		NA
	Install casing and the ~~attached tremie~~ line		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL.
	Establish appropriate grout mix ~~and pump grout through tremie line~~	NA	
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL.
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL.
	Install head works	AM	
	Head works observed to be installed		BL.
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL.
	Pits are ready for development water	AM	
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)	AM	
	Bore observed to be developed and field testing of water quality conducted		BL.
Completion	Bore successfully completed. Suitable for intended purpose	AM	BL.

Acknowledgement of successful bore installation

	Organisation	Person	Role	Acknowledgement - signature
Client Representative				
Supervising Hydrogeologist	GHD	B Llewellyn	Supervisor	B. Llewellyn
Drilling Subcontractor	JAB	Tony N	Licenced Water Bore Driller	AM

Construction notes

Notes
Bore constructed as advised.

Project number	**12609270**
Bore ID	MW 94
Easting / Northing	
Start date	15.7.23
Finish date	20.7.23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		
	Field test for hydration of bentonite pellets		
	Measure and record the casing lengths		
	Mark the casing length for the location of the tremie pipe		NA
	Install casing and ~~the attached tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL
	Install head works		
	Head works observed to be installed		BL
Bore development	GHD supervising hydrogeologist present on site prior to start of bore development		BL
	Pits are ready for development water		
	Lower air-line (polypipe) to just above the screen level and develop bore (min 1 hour)		
	Bore observed to be developed and field testing of water quality conducted		BL
Completion	Bore successfully completed. Suitable for intended purpose		BL

Acknowledgement of successful bore installation

Inspection and Testing Plan

Project	**Callide Groundwater Bore Drilling Project**
Project number	**12609270**
Bore ID	MW98
Easting / Northing	
Start date	18-7-23
Finish date	20-7-23

ITP Record – Subcontractor and GHD are to sign at each hold point. Work cannot procedure to the next step without a signature from the responsible party

Task	Hold Point	Responsibility	
		Subcontractor	GHD
Agreement of hole plan	Suitable for monitoring requirements		BL.
	Suitable for drilling and construction		
Assignment of licensed water bore driller	Licensed water bore driller present on site		
	Water bore licence sighted by GHD		BL.
Drilling equipment and construction materials	Subcontractor confirms that all required drilling equipment and bore construction materials are present on site		
	GHD completed a checklist on construction materials		BL.
Installation of pre-collar casing (only if required) NA	Establish and communicate installation depth		
	Correct casing is available at the drilling location		
	GHD confirmation correct casing is on-site		
	Install casing		
	Casing observed to be installed		
	Establish appropriate grout mix		
	Complete cementing of the pre-collar casing		
	Cementing of pre-collar casing observed to be completed		
Installation of casing and screen (completion string)	Establish and communicate installation depth and screen interval		BL.
	Correct casing is at the drilling location and is laid out		
	GHD confirmation correct casing is on-site		BL.
	Field test for hydration of bentonite pellets		BL.
	Measure and record the casing lengths		BL.
	Mark the casing length for the location of the tremie pipe		NA.
	Install casing and the ~~attached tremie line~~		
Installation of annulus materials	Install gravel pack and measure the installation depth		
	Install the bentonite seal and measure the installation depth		
	Allow the bentonite seal to hydrate		

Inspection and Testing Plan

Task	Hold Point	Responsibility	
		Subcontractor	GHD
	GHD supervising hydrogeologist confirms that bentonite has sufficiently hydrated		BL
	Establish appropriate grout mix ~~and pump grout through tremie line~~		
	GHD supervising hydrogeologist confirms that the bore annulus is grouted		BL
Construction of head works	GHD supervising hydrogeologist present on site prior to construction of head works		BL

APPENDIX J GROUNDWATER BORE DEVELOPMENT SHEETS

Well Development

STANDARD GROUNDWATER SAMPLING FIELD SHEET

Job Name:		Well No:	MW97
Job No:	BC200153.03	Date:	2/6/23
Recorded By:	DP	Time:	
Weather:			

CONSTRUCTION INFORMATION

Well Type:	Monitor ☒ Extraction ☐ Other:	Well Stick Up (m): (above/below ground level)	0.68 m
Well Material:	☐ PVC ☒ SS ☐ Other:	Screen Interval – Top (m BTOC)	~~2.5~~ 2.5
Well Head Condition:		Screen Interval – Bottom (m BTOC)	~~4.0~~ ~~4.0~~ 4.0

WELL PURGING

PURGE VOLUME		PURGE METHOD	
LNAPL Level Depth (LL in m BTOC):		☐ Bailer Type: ☐ PVC ☐ SS ☐ Teflon ☐ Other	
Water Level Depth (WL in m BTOC):	2.58	☐ Pump Type: ☐ Submersible ☐ Bladder ☐ Peristaltic ☐ Other	
DNAPL Level Depth (DL in m BTOC):		PUMP INTAKE SETTING	
Total Depth of Well (TD in m BTOC):	~~3.50~~ ~~3.75~~ 4.0	Depth (m BTOC):	
Height of Standing Water Column (TD-WL, in m):		Purged dry?	☐ No ☐ Yes, at _____ L

Minimum Purge Volume Required	Well Diameter (mm)	Well Annulus (mm)	Height Standing Water Column/ Length (m)	Multiply Length by (L/m)[1]	= Total Volume (L)	Multiply Total Volume by 3[2]
	50	100		3.5		
	50	150		6.5		

[1] Volume per 1m: casing volume + filter pack volume (effective porosity assumed at 0.3) - [πr(casing)² + 0.3 x (πr(annulus)² - πr(casing)²)
[2] At a minimum, three well volumes should be purged. If possible, up to 5 well volumes is recommended to achieve an adequate purge
Reference: Victorian EPA Groundwater Sampling Guidelines April 2000, Publication 669 - Section 4.5

FIELD PARAMETER MEASUREMENTS

Time	Volume Purged	pH	Electrical Conductivity	ORP or RedOx	DO	DO	Turbidity	Salinity Colour	TDS	Temp.
HH:MM	L	-	µS/cm	mV	ppm	% Sat	NTU			°C
2/6/23	~~~~ ~4L	7.64	663	28.3	3.72	43.5		brown		23.3
3/6/23	~4L	7.72	642	23.6	2.33	27.0		grey-brown		22.5
1/6/23	~4L	7.71	663	15.5	3.26	37.1		grey-brown		21.6
~~3/6/23~~										
Acceptable Variation		± 0.1	± 3%	± 10 mv	± 10%	± 10%	± 10%	-	-	-
Results Acceptable? Y/N										

Note: Results are acceptable after all parameters have achieved stabilisation for three successive readings within nominated tolerances as adopted from USEPA Low-flow (minimal drawdown) Ground-water Sampling Procedures, April 1996 (ref. EPA/540/S-95/504)

Observations during purging (well condition, turbidity, colour, odour):

Discharge water disposal: ☐ Drums ☐ Other: Purged dry 3 times

WELL SAMPLING

SAMPLING METHOD
☐ Bailer – Type: ☐ PVC ☒ SS ☐ Teflon ☐ Other
☐ Same as purge method
☐ Pump – Type: ☐ Submersible ☐ Bladder ☐ Other

No. of samples received	: 47		
No. of samples analysed	: 47		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Mark Hallas	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD
Timothy Creagh	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP231X-SUT PFAS: Samples 'MW43' and 'MW32' required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X-SUT PFAS: Particular samples required dilution prior to extraction due to matrix interferences. LOR values have been adjusted accordingly. The LOR for particular analytes have been raised further due to matrix interference.
- EP231X-SUT PFAS: The LORs of PFPeS and PFOS for sample 'BD02_2510' have been raised due to sample matrix interferences.
- EP231X-SUT PFAS: Samples 'BD02_2510', 'SW13', & 'ESC4' required dilution prior to analysis due to matrix interferences. LOR values have been adjusted accordingly.
- EP231X-SUT PFAS: Sample 'MW80' required dilution due to sample matrix. LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

EA005P: pH by PC Titrator								
pH Value	----	0.01	pH Unit	8.24	7.95	8.12	7.25	----
EA010P: Conductivity by PC Titrator								
Electrical Conductivity @ 25°C	----	1	µS/cm	17000	18800	1760	2050	----
EA015: Total Dissolved Solids dried at 180 ± 5 °C								
Total Dissolved Solids @180°C	----	10	mg/L	12500	13800	996	1400	----
EA025: Total Suspended Solids dried at 104 ± 2°C								
Suspended Solids (SS)	----	5	mg/L	<5	<5	<5	<5	----
ED037P: Alkalinity by PC Titrator								
Hydroxide Alkalinity as CaCO3	DMO-210-001	1	mg/L	<1	<1	<1	<1	----
Carbonate Alkalinity as CaCO3	3812-32-6	1	mg/L	<1	<1	<1	<1	----
Bicarbonate Alkalinity as CaCO3	71-52-3	1	mg/L	429	423	316	314	----
Total Alkalinity as CaCO3	----	1	mg/L	429	423	316	314	----
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA								
Sulfate as SO4 - Turbidimetric	14808-79-8	1	mg/L	2210	2460	60	43	----
ED045G: Chloride by Discrete Analyser								
Chloride	16887-00-6	1	mg/L	4760	5440	352	468	----
ED093F: Dissolved Major Cations								
Calcium	7440-70-2	1	mg/L	465	566	95	146	----
Magnesium	7439-95-4	1	mg/L	738	864	47	70	----
Sodium	7440-23-5	1	mg/L	2450	2620	220	178	----
Potassium	7440-09-7	1	mg/L	2	2	2	2	----
EG020T: Total Metals by ICP-MS								
Manganese	7439-96-5	0.001	mg/L	0.076	0.149	<0.001	0.001	----
Iron	7439-89-6	0.05	mg/L	0.06	0.08	<0.05	<0.05	----
EK040P: Fluoride by PC Titrator								
Fluoride	16984-48-8	0.1	mg/L	0.2	0.2	0.2	0.2	----
EK055G: Ammonia as N by Discrete Analyser								
Ammonia as N	7664-41-7	0.01	mg/L	0.03	0.08	0.02	0.03	----
EK057G: Nitrite as N by Discrete Analyser								
Nitrite as N	14797-65-0	0.01	mg/L	<0.01	<0.01	<0.01	<0.01	----
EK058G: Nitrate as N by Discrete Analyser								
Nitrate as N	14797-55-8	0.01	mg/L	<0.01	<0.01	0.72	8.59	----
EK059G: Nitrite plus Nitrate as N (NOx) by Discrete Analyser

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- TDS by method EA-015 may bias high due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EP231X-SUT PFAS: Samples 'MW43' and 'MW32' required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231X-SUT PFAS: Particular samples required dilution prior to extraction due to matrix interferences. LOR values have been adjusted accordingly. The LOR for particular analytes have been raised further due to matrix interference.
- EP231X-SUT PFAS: The LORs of PFPeS and PFOS for sample 'BD02_2510' have been raised due to sample matrix interferences.
- EP231X-SUT PFAS: Samples 'BD02_2510', 'SW13', & 'ESC4' required dilution prior to analysis due to matrix interferences. LOR values have been adjusted accordingly.
- EP231X-SUT PFAS: Sample 'MW80' required dilution due to sample matrix. LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Client	: **EPIC ENVIRONMENTAL**	Laboratory	: Environmental Division Brisbane
Contact	: LUKE AMIES	Contact	: Kimberly Hilton-Barber
Address	: LEVEL 17 95 NORTH QUAY BRISBANE QLD, AUSTRALIA 4000	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: ----	Telephone	: +61-7-3243 7222
Project	: BC200153.03	Date Samples Received	: 03-Nov-2022
Order number	: ----	Date Analysis Commenced	: 03-Nov-2022
C-O-C number	:	Issue Date	: 23-Nov-2022
Sampler	: MICHAEL KOWALCZYK		
Site	: ----		
Quote number	: BN/344/21 V3		
No. of samples received	: 1		
No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Timothy Creagh	2IC Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2232600**	Page	: 1 of 29
Client	: **EPIC ENVIRONMENTAL**	Laboratory	: Environmental Division Brisbane
Contact	: LUKE AMIES	Telephone	: +61-7-3243 7222
Project	: BC200153.03	Date Samples Received	: 03-Nov-2022
Site	: ----	Issue Date	: 23-Nov-2022
Sampler	: MICHAEL KOWALCZYK	No. of samples received	: 49
Order number	: ----	No. of samples analysed	: 49

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	49	2.04	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Suspended Solids (High Level)	EA025H	WATER	In house: Referenced to APHA 2540D. A gravimetric procedure employed to determine the amount of `non-filterable` residue in a aqueous sample. The prescribed GFC (1.2um) filter is rinsed with deionised water, oven dried and weighed prior to analysis. A well-mixed sample is filtered through a glass fibre filter (1.2um). The residue on the filter paper is dried at 104+/-2C . This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride. In the presence of ferric ions the liberated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm.
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X-SUT	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is concentrated, combined with an equal volume of reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Date Samples Received	: 08-Nov-2022 10:00	Issue Date	: 10-Nov-2022
Client Requested Due Date	: 22-Nov-2022	Scheduled Reporting Date	: **22-Nov-2022**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 3	Temperature	: 3.1<->9.2°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 22 / 22

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **10/11/22: SRN has been resent to acknowledge the correction of sample IDs. For any further information regarding these adjustments please contact client services at ALSEnviro.Brisbane@alsglobal.com.**
- *Samples were originally received by ALS Gladstone on 07/11/2022 and have been forwarded to ALS Brisbane for analysis. Temperature on arrival in ALS Brisbane has been noted above.
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- **Samples "SD05 and SD06" has been forwarded to Eurofins , as requested. Please note that this will incur a freight forwarding fee.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **EB2232870**	Page	: 1 of 21
Client	: **EPIC ENVIRONMENTAL**	Laboratory	: Environmental Division Brisbane
Contact	: LUKE AMIES	Contact	: Kimberly Hilton-Barber
Address	: LEVEL 17 95 NORTH QUAY BRISBANE QLD, AUSTRALIA 4000	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: ----	Telephone	: +61-7-3243 7222
Project	: BC200153.03 CALLIDE	Date Samples Received	: 08-Nov-2022 10:00
Order number	: ----	Date Analysis Commenced	: 08-Nov-2022
C-O-C number	: ----	Issue Date	: 24-Nov-2022 17:20
Sampler	: MICHAEL KOWALCZYK		
Site	: Callide		
Quote number	: BN/344/21 V3		
No. of samples received	: 22		
No. of samples analysed	: 22		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Assistant Laboratory Manager	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- As per QWI – EN55-3 Data Interpreting Procedures, Ionic balances are typically calculated using Major Anions - Chloride, Alkalinity and Sulfate; and Major Cations - Calcium, Magnesium, Potassium and Sodium. Where applicable and dependent upon sample matrix, the Ionic Balance may also include the additional contribution of Ammonia, Dissolved Metals by ICPMS and H+ to the Cations and Nitrate, SiO2 and Fluoride to the Anions.
- The presence of high SO4 may bias the EC low.
- Ionic Balance out of acceptable limits for some samples due to analytes not quantified in this report.
- EP231X-SUT PFAS Super Ultra Trace: The LOR of particular analytes have been raised due to sample matrix interferences.
- EP231X-SUT PFAS Super Ultra Trace: Whole bottle extraction was not possible for particular samples. Samples required dilution prior to extraction due to matrix interference (High Sediment) LOR values have been adjusted accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results
